[60] In semiotics, a flicker can be compared to a cultural unit in Umberto Eco's system (Eco, 1976, pp. 71-72); Eco's comments on semantic units in the Qur'an and their history as understood in Europe are also instructive (p. 145, note 10). Also, flickering is a phenomenon related to the "expression substance" or physical, formal substrate in Louis Hjelmslev's theory of linguistics (see Hjelmslev, 1961), which allows any coherent form on principle to be understood as a kind of signal from the past to the present that may be decoded.

[61] Flickers are coherent as such, automatically, to those prepared to recognize them by rote experience or conscious training, such that a set of symptoms may be immediately coherent as expressions of a specific illness to an experienced healer, or as a linguist may recognize one's geographic and class origins by the inflections of one's speech (see Thesis One).

[62] I am using this specifically in the sense Bhabha develops in his analysis of Fanon's (1960) interventions into the psychology of the postcolonial situation; William Blake's fragmentary epic *The Four Zoas* dramatizes a broadly analogous critique of mimicry under empire two centuries prior, and in recognizably holographic terms, presenting what must be among the first integral macropolitical theories responsive to industrial capital.

By contrast to mimicry, *critique* is conscious, intentional behavior designed to reflect the reality of a given moment or regime back to the socius, in order to provoke structural change in it. Critique is a transformational practice, if put forward properly, in that it dissociates one from a regime, destroys or overthrows a regime, or de/reterritorializes a former regime to form a new one on new terms. At bottom, critique is *the happy practice of creating new values for the benefit of all and everything*.

One can see how various discrete moments in the development of what we now think of as integral praxis may have arisen as interventionary or mimetic responses to real phases of social, political, and economic order, rather than evolutionary stages of development building one on the other. As it happens, global capital has evolved in specific places and times with changes in available resources and other constraints; it is not as if one day early in the Twentieth Century the world's values became "modernist" in a homogenous fashion, or later, arbitrarily and universally cut it out and became "postmodernist" instead by the methods or whims of this or that thinker, as one may be led to conclude from a survey of the history of ideas such as Wilber (1981) or Wilber (2000a)[64] (see Thesis Seven). By contrast, I submit that integral praxis of the sort I am advancing is a coherent *oppositional* tactic, as Gidley suggests,[65] in a dance with *hegemony*, *into subjectivity*, which is to say in *everyday life*. It is theory, to be certain, but theory for the sake of compassionate action. It is a species of the *emergent* (see Thesis Two) that assumes different strategies as it advances in concert with specific historical contingencies and with greater or lesser success depending on the instance (some as simple *flickers*, others as intentional *mimicries* or *critiques*) by people who had nothing or not much in common with each other—no knowledge of each other in most cases—*except* a shared subaltern if not always or exclusively oppositional relationship with the expression of Empire through immediate contingencies, not always immediately recognizable *as* such. I submit that coherently integral practices arise dialectically in concert with world-historical expressions of capitalism,[66] such as the familiar imperial, Fordist, and neo-Fordist (integrated global capitalist) articulations of political economy as experienced in North America and Britain, either in sympathy with or opposition to the impositions of the private-property regime or ambivalently Janus-faced between either position, and often slightly *later* than most of the antecedent transformations in political economy, as if in response to those transformations—much as one may observe in military history that technological advances in weaponry generally but not always *predate* advances in armor and defensive provision.

---

[63] What I call *theory in bad faith* has as its program, according to Nizan (1971) (skillfully employing another "consumption" metaphor): "to gain universal acceptance for the established order by making it palatable, by conferring upon it a certain nobility, and by furnishing rationalizations for its every aspect" (p. 91).

[64] In a more recent better-developed instance, Mastustik (2007) gives a production history of his integral critical theory as a series of interventions by great minds into theory as such Kant, Hegel, Marx, Nietzsche and Freud (implicitly Feuerbach, the common denominator between them), the Frankfurt School, Habermas, and Wilber.

[65] For instance, Gidley (2007) reads Teilhard's work and its legacy as a potential "counterbalance to the hegemonic excesses of globalization" (p. 190). One example of what may fairly be described as a Theilhard-inspired oppositional project would be Fox & Swimme (1982), which includes an admirable celebratory call for compassion (pp. 29-30).

Imperialism. Rosa Luxemburg demonstrated early in the Twentieth Century that, under empire, the world became consumed without margins, nondual in an unusual sense, under a global regime. The task of capital in this phase was to integrate control over its imperial members socially and subjectively. Thus, post-Hegelian and positivist synthesis is explored (Aurobindo, Gebser[67]), but on the terms of Spirit rather than the literal cannon.[68] The critical question is whether this attempt is an ideological cipher or mimicry for European force, as I suggest it is in important ways for Aurobindo (Anderson, 2006), or if it is a redoubling of spiritual and intellectual force against this hegemony, as I think it usually is in the tradition of Marxist and post-Marxist critique. This question remains a live one; my intention here is only to frame it for further inquiry in order to show that what we call integral critique at the time of capital's explicitly imperial period responded directly in form and content to the conditions of an imperial regime. This still very much matters because imperialism carries on, if in different forms and by different means than it was implemented during the Scramble for Africa (see Chile, 1973 or Iraq, 2003), and the residual forms of the early integral response (such as Aurobindo's Providential theory of evolution) remain in the writings of key integralists as functioning ideologies or residuals.

---

[66] Capitalism is understood here not as a set of values or a static structure but as a dynamic kind of regime best described as a very large and aggregated machine that, with some intelligence but with or without responsibility, functions by constantly breaking down and consuming bits of itself as fuel and as raw materials (Deleuze & Guattari, 1983)—in short, reinventing itself in fits and starts (see Thesis Seven).

[67] I find the origin of integral theory as an intellectual movement in Aurobindo's post-Hegelian positivism (Anderson, 2006); Hampson (2007), in a useful counterbalance to my position, cites Gebser's positivist, post-Hegelian synthetic work as the foundational gesture of integral theory. Both positions have merit, and broadly speaking, do not contradict, insofar as both Aurobindo and Gebser were working from largely the same intellectual milieu the Hegelian and post-Hegelian idealism Wilber (2000a) praises as a "lost opportunity" (pp. 523-537) and in the context of Empire's transformations. Such is the ambivalence of the post-colonial situation.

[68] Integral praxis has arisen under the aegis of private property, as a response to it—in some cases critical and oppositional, in some apparently so but not actually, in others still positively and explicitly supportive of the regime at hand. Since this is the case, if integralists are to have a complete understanding of our collective project, we need to develop the theoretic tools for understanding how our ideas circulate as commodities and as flecks of ideology—that is, by whom and how our work is deployed, under what terms, and under whose control. The Marxist tradition provides means for explicating all this ready-made and, in my view, already postformal if not always already-integral or responsible. Toward this end, one of the implicit purposes of the present inquiry is the continued patriation of Marxist and post-Marxist inquiry into integral discourse that I began in Anderson (2006).

Fordism. Because of the temporal regime of Taylorist and, later, Fordist modes of production, which "adapted to the restriction of the working day by sharply increasing the intensity of labor and systematically compressing wasted time" leaving positively no rest from the inevitable rhythms of the assembly line (Aglietta, 2000, p. 158), it is no accident that at this period Krishnamurti's observation that time is man's psychological enemy could gain significant traction—this reflects the lived experience of people in their work, and offers a strategy for addressing the dissatisfactions of that life experience. It is here and at this time that, in popular culture under this regime, a variety of strategies for fulfilling one's *human* potential (as opposed to the mimetic, mechanical potential fulfilled at work) arise *as commodities* at a spectrum of price-points, beginning with Paul Twitchell's correspondence courses in the middle 1960s[69] and ending with weekend retreats led by Werner Erhard or at a Shambhala Center or at Esalen Institute, along with a multiplicity of other supplemental comforts such as books, audio recordings, and the "Zen alarm clock." "Zen," as Unno (2004) observes, at this time became and remains still a marketing buzzword for at-home comfort, serenity, and sound design sensibility. This is both a function and an aspect of the contingencies of consumerism. According to Aglietta, "[i]ndividual commodity consumption […] permits the most effective recuperation from physical and nervous fatigue in a compact space of time within the day, and at a single place, the home" (p. 159). As in the case of integral praxis under (or for or against) an imperialistic regime, here the critical question is whether this broad set of practices serves in the end to unplug one from the assemblage of desiring machines, freeing the subject from it and making transformation possible, or if the function is simply as a palliative, as an affective strategy for *just getting by*, inadvertently leaving the problematic conflictual order intact[70] or, worse, even stronger for one's complicity with it.

Global Finance or "Neo-Fordism." Fully-integrated, trans-national, and *vertical* supply and production chains, deep organizations cross-subordinated within each other and oriented around and through "global cities" rather than state boundaries,[71] such that states become divisions of capital, local regulatory bodies of a global process—one may now call global capital under this regime Integral Reality as Baudrillard (2005) does, or Integrated Global Capital as Guattari (2000) does. Aglietta calls it neo-Fordism: "a totally integrated system in which production operations properly so called, as well as the measurement and handling of information, react upon one another as elements in a single process, conceived in advance and organized in its totality" (p. 124).[72] As will be seen, it corresponds to a kind of neo-colonialism (see Thesis Seven). In the conspicuous case of Wal-Mart, a "superholon" localized in Bentonville, Arkansas subordinates factory subholons in China and distribution to North America much as a brain controls the voluntary organs of the body and manages its involuntary flows (Fishman, 2006). In short, Wilber's *ontological model*, his description of fundamental reality, expresses this social and political order very precisely: seamless, top-down order where all totalities are subordinated to other totalities, but not imagined as parts of those totalities. Nation-states are thus understood as wholes, subordinated to global capital but not as *parts* of it per se; similarly, corporations are integral wholes, not parts of nation-states; citizens are autonomous wholes, not parts of corporations or nation-states; but all are subordinated to a "superholon" and internested with each other in *holarchy* (Wilber, 2000a).[73] Pedagogy is transformed under this regime, so that the university effectively becomes a public corporation, serving corporate interests, while the dominant site of and model for learning becomes the corporate training seminar, where inquiry is jettisoned in favor of "solutions." A field appropriate to problem-posing and open questions, per the scientific method, is foreclosed by ready-made *commodities* or "learning modules" (see Thesis Eight).[74] Other business of the state, such as the monopoly on legitimized violence, also becomes privatized, through mercenary agencies prosecuting acts of war abroad (Blackwater and other "private security firms") and private interests contracting the management of prisons, while the state's business turns to the interests of capital, securing "national interests" such as access to (other people's) natural resources abroad through state violence.[75]

---

[69] My only claim regarding Twitchell is that his production and distribution of spiritual lessons to be used at home fits the pattern of consumption of goods for relaxation at home during this period in history in North America. This distinguishes Twitchell's prophetic claims (and those of his contemporaries, inclusive of Jane Roberts, Elizabeth Clare Prophet, and Claude Vorilhon [Rael]) from those of antecedent American figures such as Joseph Smith, John Ballou Newbrough, and Guy Ballard, who wrote in response to a fundamentally different social order. I am not at present entering the debate regarding Twitchell's later literary practices or his motivations as initiated by the intervention of David Lane, who is also a public critic of Wilber. Diem (1995) surveys this matter a value-neutral way, inclusive of Twitchell's relationships with mid-century American culture and with his sources in Radhasoami and Scientology as well as Lane's analyses. Marman (2007) attempts a rebuttal of Lane's position in the form of a personal narrative that is very sympathetic to Twitchell's organization and his project, and is thematic rather than critical methodologically.

[70] My position on this question is that some produce good transformational results, others produce good developmental results, and others produce no good results at all, and *all* are commodities. Pointing out the commodity nature of a practice or product is intended neither as disparagement nor endorsement here, simply a historical reality.

[71] See especially Sassen (1990), although Deleuze and Guattari (1983) anticipate this development.

---

[72] I assume that the financial crisis of October 2008, occurring as I make final revisions to this essay, can only be properly interpreted in terms of global interconnectivity and integration.

[73] Wilber (2000a) distinguishes social, environmental, or collective holons from holons as such by the feature of objective self-consciousness (p. 72), which at first glance seems to complicate my point that Wilber's ontology is a reflection of its social moment. This distinction is incoherent in application, however. Wilber suggests that a stone and the totality of being (Kosmos) are both holons, and therefore are both characterized by subjective self-consciousness (the latter of which is Spirit). However, collective holons for Wilber, lack this unitary self-consciousness, meaning that aggregates such as nation-states and corporations do not participate in holarchy so much as provide a context for the evolution of individual holons. Wilber gives no rationale for his decision to subjectivize and spiritualize a stone but not a socius, and the aggregate of all aggregates but not the middle-management of aggregated coherences—and for this reason I call this distinction incoherent. My claim that Wilber's metaphysical view of reality seems to flicker our present-tense means of economic and political reproduction stands regardless of the distance from the social Wilber attempts to produce by positing this individual-collective holonic distinction.

[74] Wilber (2003) is a remarkable artifact of this transformation. In *Boomeritis*, students at the I.C. (or rather the audience of the seminar performance) privately complain about the perceived difficulty of themes presented to them, but choose to retake the coursework over and over, groaning at predictable moments, like automated laughter during a sit-com or a film score; like machines, they groan on cue, cheer on cue, and inevitably know what comes next (presumably through repeat exposure to the same show). Paragraphs appear to be silently copied and pasted from Beck & Cowan (1996). Wilber's narration of simplistic, repetitive, performative, and commodified *content delivery* should be contrasted against the actual *pedagogy* Friere (1993) proposes.

[75] Armando Uribe (1975) gives a detailed, often first-person account of how American financial, academic, military, and commercial interests literally acted as one, *as an integrated system*, in the undermining and eventual overthrow of Chile's attempt at radical democracy under Salvador Allende. Thirty years later, in the case of Iraq, Empire is still ideologically articulated in Orwellian jingoisms such

Internested holarchy. The transition from Fordism to neo-Fordism corresponds precisely to the leap from the first to the second tier of vMemes in Spiral Dynamics, where both global integrated capital (a "single dynamic organism") and Wilber's oeuvre represent turquoise, a step *past* the yellow or "integrative" vMeme (Beck & Cowan, 1996, p. 47) which describes Wal-Mart's business model and Halliburton's since at least 2003—that is, Wilber's model and Spiral Dynamics both represent the outcomes of subjective transformations and ontological processes through a description of contemporary socioeconomic phenomena, "flickering" those processes in a different context (see Thesis Seven). What Spiral Dynamics takes to be a paradigm shift in values, Aglietta shows to be a near-Darwinian (or near-Malthusian) adaptation in self-reproduction of a macro-organism to an alteration in resources and capacities (see Thesis Seven). This is evolution of a sort, but not Providential or Aurobindian evolution (see Theses Six and Seven). In a related context, Wilber's AQAL scheme is arguably the most comprehensive measure for assuring one has a coherent place in the most coherent whole imaginable, arising precisely when anxiety about one's place in corporate culture intensifies under this regime, including diminished job security and declining real wages arises under global finance (Aglietta, 2000, pp. 406, 422). As before, the critical question for Spiral Dynamics and AQAL is whether or not the theory supports practice that is reductive or mimetic on the one hand, or transformative and interventionary on the other, is ambivalently both, or is neither.

What change is introduced in each case? The most important may be the contribution of Marx and Engels in *The German Ideology* that people living their lives—productive or not, spiritually engaged or not—*make ideas*, and not necessarily or always vice versa[76] (see Thesis Seven). A new paradigm on its own and for its own sake changes little in life, and may in fact serve to counteract meaningful change (Anderson, 2006) (see Thesis Seven). You have to change your life, which means you have to change the structure of lives lived together in cooperation, including the terms of that cooperation and the means of controlling that structure (see Theses Four and Eight). That is, other useful results notwithstanding, one could argue that no integral paradigm to date has brought about a socially significant and sustainable transformation in any regime of values—not yet.

It can be done if theorists are willing to be responsible for that change in a specific sense, a merciless commitment that opens the theorist to exposure to reaction and to a relentless, inescapable investment of time and labor,[77] to the death.

---

as "spreading democracy" and "enduring freedom," but acted out through a seamlessly integrated body of governmental and corporate organs (Halliburton, Bechtel, Blackwater)—an apparatus of capture (Deleuze & Guattari, 1987)—working toward a common interest, accumulating capital by controlling resources and access to resources. This is the capital-regime Aglietta calls "Neo-Fordism" but is more popularly known as integrated global capital.

[76] Marx expresses this differently in the third thesis on Feuerbach: "The materialist doctrine that men are products of circumstances and upbringing, and that, therefore, changed men are products of other circumstances and changed upbringing, forgets that it is men who change circumstances and that it is essential to educate the educator himself."

[77] e.e. cummings narrates a dramatic, arguably hyperbolic, example of this risk in his poem "I sing of olaf glad and big." The first intervention, which made Olaf a conscientious objector then conscripted into the army, is presumed as backstory. The reader is led through the discipline of Olaf's second intervention, which amounts to an unstinting commitment. Olaf persists in his practice of the Big No (see Theses Four and Seven) through the extraordinary and hypocritical violence that leads to his death; patiently, even

Thesis Four

> *Responsible intervention can produce real transformation in the totality. The first intervention is to recognize the nature of a given situation; the second is to maintain relationship with it over time. Responsibility is characterized by critical clarity, competence, consciousness, and compassion.*

There are two transitions in any successful attempt to make something, according to Blake's (1996) Gurdjieffian analysis. "In the one," Blake asserts, "the action of making is set free from the laws of the mechanical world from which it starts. In the other, it is made an integral part of the purposeful world in which it ends" (p. 57). Much follows from these observations on production and productivity. In *The Encyclopedia of Stupidity*, which is in the last analysis an inquiry into intelligence and intelligent action, van Boxsel (2003) describes the accrued development of a culture in the same way that Blake describes the production of something useful. Culture, intelligence, and theory are "but the result of a series of more or less unsuccessful attempts to come to grips with stupidity" (van Boxsel, 2003, p. 23), where stupidity is defined first as "automatic responses" (p. 37) and second as "the talent for acting unwittingly against your own interests" (p. 29). This is the obverse of the dialectic of conditions and consciousness posited earlier, where knowledge is made (see Thesis One);[78] here, accurate and useful knowledge is shown to be dialectically occluded, on one side by an inscrutable object and on the other side by an incompetent subject, both reifying each other into a repetitive, mechanical, and at best boring pattern.[79]

In order to accomplish anything novel, to transform something old into something new, one must work against the constraints of the mechanical regime-world, which subjects one to reification both as stupidity and as lack of control—*automatic responses*—to bring forth a contribution to a purposeful world for which one can be responsible, in which one really works to advance one's best interests, which at bottom coincide with those of the socius in which one is embedded and the sum total of animated life. The subject is transformed from a *produced* articulation, bound to "repeat the same dull round over again,"[80] subordinated to the control of another regime, to a *self-directed* articulation, with a degree of real (not compelled or coerced) control over itself and its activities.

---

unannoyed, he absorbs countless blows from the bureaucratized and self-imitating mass—"kindred intellects"—while taking as his constant mantra, "there is some shit i will not eat."

[78] Merleau-Ponty (2003) presents this rather poetically: "It is true that we carry with us, in the shape of our body, an ever-present principle of absent-mindedness and bewilderment" (p. 31).

[79] Svendsen (2005) offers a useful analysis of the relationship between the recurrence of boredom and the perceived need for self-realization as a condition of modernity.

[80] William Blake (1982), "There is No Natural Religion [B]." Blake anticipates Nietzsche's speculations on the eternal recurrence of the same here, but in a way that connotes not only a mathematically infinite boredom but more directly a manifold of infinite *bindings*, affectively in Blake (as in his poem "London") and also in later attempts to represent said recurrence by means of arithmetic, which Borges (1999, pp. 14-122) and Ouspensky (2001, pp. 329-340) attempt to perform. This interpretation of eternal recurrence contrasts with Kelly (2008), which reterritorializes Nietzsche's position into a Hegelian framework.

The category of automatic responses includes every way in which a subject behaves mechanically, predictably, without awareness, volition, or intention. Some responses of this type are useful, such as the automatic capacity to recognize letters of the alphabet without thinking each one through in fluent reading; others, such as the persistent unconscious association of negative stereotypes such as incompetence with female persons arising automatically in the presence of a woman or a girl, are clearly not helpful but are in fact *stupid* (see Thesis One). Marcuse (1969)[81] identifies "an automatism of immediate experience, but a socially engineered experience which militates against the liberation of sensibility" (p. 39), a *specific* response to a *specific* set of contingencies that has become automatic under what is popularly referred to as consumer culture. According to Marcuse this is a "deep-rooted, 'organic' adaptation of the people to a terrible but profitably functioning society," and in this adaptation "lie the limits of democratic persuasion and evolution. On the overcoming of these limits depends the establishment of democracy" (p. 17). Establishing authentic democracy on the basis of liberated subjectivity (see Thesis Eight) is a project that must face the push of the inertia of these automated responses, however—a heavy burden.

As with any coherence, the mass, the multitude, represents both the symptom of this problem and its solution. According to Marcuse, "radical change depends on a mass basis, but every step in the struggle for radical change isolates the opposition from the masses and provokes intensified repression" (p. 68), at least initially. This leads to significant discomfort and disadvantage for the one who fully commits to transformational practice. Such a one becomes-minoritarian[82] as he or she becomes-responsible. The repression Marcuse speaks of is one causal aspect of becoming this kind of minority. It is because the mass experiences itself as plugged in or even accountable to the mainstream, literally going with the flow without purpose or intention,[83] "'just like everybody,'" while responsibility requires the conscious work of making critical distinctions (Ortega y Gasset, 1964, p. 15), and in my view actively unplugs one from the complex of desiring machines that keeps this version of the totality in place (Anderson, 2007). This is an act of responsibility in that one is claiming the kinetic stream one *can* claim as one's own and directing it toward aims that benefit not only Bentonville but all beings. By contrast, under this regime the masses are encouraged to behave, think, and emote like spoiled children, and become "only concerned with their own well-being, and at the same time they remain alien to the cause of that well-being" (Ortega y Gasset, 1964, p. 60)—and, thus ignorant of history and the Gurdjieffian terror of their own out-of-control situation, see no need for change. It is true, "[t]he mass-man regards himself as perfect" (Ortega y Gasset, 1964, p. 69), and there is a specific reason for this podsnappery. It is an expression of the hopeless, hapless logic of incompetence, where incompetent people have no understanding of what constitutes well-crafted work, and therefore see no qualitative difference between their own blighted output and that which is useful, elegant, and helpful. Incompetence, then, leads one to misunderstand one's place in the world as it is and as it could be,[84] and to become dissatisfied with it but on grounds of resentment against perceived slight rather than compassion for the sufferings of others, and self-righteously indignant with those who have the capacity to be of real help (Kruger & Dunning, 1999). Van Boxsel describes this phenomenon as "the bigoted righteousness of the masses" (p. 19) and, coupled with the ideological workings of the consumer-capital regime, produce in the masses

---

[81] This is a particularly useful text for an integral approach, as Marcuse synthesizes in it the critiques and themes he presents in his more detailed engagements, such as *One Dimensional Man* and *Eros and Civilization*.

[82] Deleuze and Guattari (1986) develop this concept, asserting: "There is nothing that is major or revolutionary except the minor" (p. 26).

[83] Roy (2006) and, in response, Anderson (2007) offer distinct but related views on how this causal flow that produces subject by moment is articulated, the former ontologically-oriented.

> that diffused aggressiveness which, unless steered to hate and fight the alleged national enemy, hits upon any suitable target […]. This is the aggressiveness of those with the mutilated experience, with the false consciousness and the false needs, the victims of repression who, for their living, depend on the repressive society and repress the alternative. (Marcuse, 1969, pp. 50-51)

This is tragically stupid in the Aristotelian sense because the alternative of ending this cycle of repression, responsible transformation, is ultimately in their interest and represents an act of compassion if implemented consciously and with competence as an end of a regime that runs on violence, synthetic and real, and antidepressants. Just as becoming-competent can serve a pathological regime by holding a conflicted totality together (see Thesis Two), so can remaining-*incompetent* do the same. A transformational project must, then, address both *incompetence* and *uncritical competence,* colloquially known as "idiot compassion" and "enabling."

While he does not advocate it, Ortega y Gasset correctly distinguishes this kind of transformation from an evolutionary development: "Revolution is not the uprising against pre-existing order, but the setting up of a new order contradictory to the old one" (p. 57). There is no need to do violence to the old regime in principle, nor are "stupid people" the problem. The specific problem is not even stupidity as such, which can be learned from and ameliorated, but the processes that make people stupid and keep them happily so, if synthetically happy, and sometimes violently so, and the incentives built in for making others stupid—for keeping these processes in place. An authentic solution, as I show later, is to institute spaces that allow people to become happy, productive, and responsible (see Thesis Eight).

One of these stupefying processes, uncritical competence *par excellance*, appears to be *very* intelligent. What I call *theory in bad faith* is one ideological means of making people stupid per van Boxsel's second definition of stupidity, *working against one's own interests* while thinking—being led to think, to feel—that one is on the side of morality, on right side of history, by identifying one's interests with the make-believe Providence of a pathological regime rather than the wellbeing of the totality. My intention in developing this concept at present is no more than to give some symptoms of a pathology for readers to identify in the work of theorists generally, and integral theorists in particular (inclusive of my own work), to be cut through and composted. One conspicuous and relatively contemporary instance of theory in bad faith would be Fukuyama's (1992) declaration that the world has come to the "end of history as such: that is, the end point of mankind's ideological evolution and the universalization of western liberal democracy as the final form of human government" (p. 3)—meaning that our work in the world is over, for the New Age of unfettered capital is begun[85] (see Thesis Seven).

---

[84] Of the seven traits of the Hasnamuss or reprobate fool that Gurdjieff (1999) proposes, the last and most unbearable is most directly relevant to the Nietzschean critique Ortega y Gasset offers: "The striving to be not what one is" (p. 406).

For Nizan (1971), among the first to examine the problem posed by positions such as Fukuyama's, this is the critical question: is a particular theory of use to those who oppress, or to those who seek to transform oppression into justice? This distinction in practice corresponds to that between Sein (being) and Schein (appearance):

> When the philosophers discuss Mind and Ideas, Ethics and the Sovereign Good, Reason and Justice, but not the experiences, the misfortunes, the events, the 'daily grind' of which life consists, those who fall victim to these misfortunes, who bear the weight of these events, who undergo these experiences, who endure this daily grind—in a word, those who must endure this life—find this style of philosophizing arrogant and repugnant. (p. 14)

For Nizan, big-Being questions addressed uncritically (in this case by the positivists he critiques) can occlude real problems and by this means help prevent meaningful inquiry into apparent matters in the world of sensation and causation (see Thesis Two). Nizan's solution is to become a theorist responsible for the subaltern, on behalf of and for the benefit of the oppressed and deluded masses, one who "will not be a dispenser of illuminations or an artificer of myths or a wizard" (p. 139) or indulge in make-believe.

Aglietta (2000) explains how this connection Nizan posits between positivist spiritual speculation and, in the last analysis, the expression of capital's imperatives through violence was implemented historically:

> The ideological institutions of capitalism absorbed intellectuals originating from all social strata; bourgeois representations of the world were constructed without resistance; the juridical principles of the state took on a sacred and eternal character. Any questioning of free enterprise was perceived as a threat to the integrity of the nation. (p. 74)

Fanon (1965) extrapolates Nizan's critique of European idealists into the postcolonial field, presenting an intervention of his own that remains relevant (my use of "mimicry" in the present inquiry finds its origin in Fanon's groundbreaking work). Fanon advises the subaltern to

---

[85] Wilber (2000a) endorses this view insofar as the "*mutual recognition*" Wilber and Fukuyama assume to be inherent in liberal democracy is an"omega point that pulls history and communication toward the free emergence of that mutual recognition. Short of that emergence, history is a brutalization of one self or group of selves trying to triumph over, dominate, or subjugate others" (p. 321), as regularly occurs within liberal democracy and as one liberal democracy relates to others (as in U.S. intervention in Chile on 11 September, 1973 and immediately after). The coincidence of the putative End of History with the Final Theory, both of which answer all questions or at least frame all possible questions, in the millenarian language Wilber adopts from Teilhard, is an implicit point of critique in Thesis Seven. It should be noted that Fukuyama has since complicated but not withdrawn his support for the project of spreading this history-ending democratic form through the bomb-and-tank evangelism by which it is implemented (Fukuyama, 2006).

> waste no time in sterile litanies and nauseating mimicry. Leave this Europe where *they are never done talking of Man, yet murder men everywhere they find them*, at the corner of every one of their own streets, in all the corners of the globe. For centuries they have stifled almost the whole of humanity in the name of so-called spiritual experience. Look at them today swaying between atomic and spiritual disintegration. (p. 311, emphasis added)

While it is not literally true that *every* Northern urban streetcorner is a murder scene[86] (suburban violence-by-proxy of American right-wing radio culture notwithstanding), Fanon does show that the "sacred" character of imperial institutions as produced by European intellectuals and theologians in the period of high imperialism is something needful to intervene in if the subaltern is to find political or human emancipation, even today. If one is to lead a free life, one must first find the means to authentic freedom, not a political agenda *pretending* to apolitical Freedom or the End of History. Taking Aglietta's observation together with Fanon's on this theme, I propose that that *theory in bad faith served to hold European polities together in the service of capital as well as promoting an imperial program*—"the *integrity* of the nation" against "spiritual *disintegration*."[87]

An *integral* solution must, in *good* faith, intervene in the totality in a way that addresses both problems concretely, that of pathological automatic response and the means of production of consciousness turned to the production of stupidity. I propose two interventions. *The first is a recognition of the need to change with the resolution to carry it forward; the second is an ongoing transformation; taken together, both interventions amount to becoming responsible in a particular way*: "Understanding the first type of stupidity," that of being shot through with distorted ideas and mechanical responses, leads

> to insight, is evolutionary, contributes to our development. Seeing through the stupidity of our thinking on the other hand is revolutionary. Its consequence is madness or redemption: thought is liberated from its confining laws and the road thrown open to the creation of new forms of thought ex nihilo. (M. van Boxsel, 2003, p. 44)

When one becomes responsible, one becomes *capable* of producing new values, if not necessarily *competent* at producing new values.

The first intervention is an act of critical compassion. "*You have to respect* everybody. *You cannot make a random judgment on that at all* […]. *That is the Big No. You can't act on your desires alone*" (Trungpa, 1999, p. 136). Resolving to refuse a small benefit, one's own alone, for the sake of the comprehensive one[88] is a discipline Marcuse (1969) calls the Great Refusal, which is amounts to saying the Big No to "the liberties of [an] exploitative order—a liberation which must precede the construction of a free society, one which necessitates an historical break with the past and the present" (p. viii). In everyday language, one may say: *I get it now, and no, I'm not doing this anymore. I'm going hungry*.[89]

---

[86] It also is true that many Northern streetcorners are sites of resistance to violence and the means-to-violence, as a careful analysis of the events in Seattle on 30 November, 1999 will reveal.

[87] The question of whether this kind of "holding the world together" is a viable criterion for integral leadership is taken up in forthcoming work.

[88] Thus, the Big No is to be understood not as a unitary or archetypal "soul of revolt" but as multiple, local, and contextual (Foucault, 1978, p. 96). It is motivated not by the pursuit of pleasure, which is (per Foucault) a bottom-up function of power rather than a means of resistance, but by critical compassion.

The discipline of responsibly keeping this commitment in a thoroughgoing fashion is the second intervention,[90] in which *responsibility leads to making space for new values, which leads to the production of new values* in place of the old mimetic machinery. The work of making space[91] in which this can happen is collaborative in that new values emerges "only in *the collective practice of creating an environment*: level by level, step by step—in the material and intellectual production, an environment in which the nonaggressive, erotic, receptive faculties of man, in harmony with the consciousness of freedom" (Marcuse, 1969, p. 31). Even the radical antinomianism of revolutionary desire, as will be seen, is social in nature (see Thesis Eight).

Domesticating the production of values is a critical step in democratizing subjectivity. Leo Strauss (1973), the intellectual forefather of American neoconservatism, accurately frames this problem from the perspective of the subject-at-large:

> What is called freedom of thought in a large number of cases amounts to—and even for all practical purposes consists of—the ability to choose between two or more different views presented by a small minority of people who are public speakers or writers. (p. 23)

If anything like the Habermasian public sphere exists now, it is effectively rigged, much as the game of brand preference is for any kind of commodity. Whether one chooses cigarette X or cigarette Y, one chooses cancer rather than any kind of fulfillment; if democracy as it is known in any given Western state is the final-perfect form of government, then the scope of one's choices is effectively foreclosed. I propose instead that everyone attempt to take up the discipline of making new values, and that those who master this practice first must go further and make space for others to learn how.

Transformational practice demands one take responsibility for what one can be responsible for. If a comprehensive transformation is to occur, one must be able to take *real* responsibility for two factors, the means of production and reproduction of established society, and subjectivity, political consciousness (Marcuse, 1969, p. 56). Ortega y Gasset (1993) takes responsibility of this kind to be "the Herculean task of genuine aristocracies" (p. 21); by contrast I take this to be the task first of a critical vanguard working from the bottom up—working, precisely in Ortega y Gasset's formulation of effortful servitude and discipline (p. 63), or in Gurdjieff's famous summary of his own practice, conscious labors and intentional sufferings. This is *real* responsibility, or becoming-responsible.[92] Becoming-responsible is a practice that includes both interventions and takes many forms. One can see from this discussion of transformation and intervention that a responsible vanguard or agent must have at minimum the following four characteristics:

---

[89] In theological language, one might say that the first intervention corresponds to the "turn" of one's intentions to the divine in recognition of the divine that Buber (1958) describes.

[90] According to Marcuse (1969), "radical change in consciousness is the beginning, the first step in changing social existence: emergence of the new Subject" (p. 53), suggesting that the emergence of this new subjectivity is the task of the second intervention.

[91] Even Puritan England and Anglo-America, the chronotope *par excellance* for a repressive spiritual holarchy, offers at least two well-defined examples in which an agent attempts to make space for new values. One is Thomas Middleton's attempt to craft a theatrical space in which a nonviolent masculinity can be explored and celebrated (Taylor, 2007), a pinnacle of the broader social experiments imagined during the stage explosion of early modern England; another is Roger Williams's crafting of a social scene in which "soul libertie" or radical antinomianism might be possible in what is now the U.S. state of Rhode Island (Field, 2006).

Becoming-critical. One is able to read one's moment clearly, without misunderstanding.

Becoming-competent. One is able to take self-directed action toward an intelligent (critical, conscious, compassionate) aim with increasing skill; one is willing to learn.

Becoming-conscious. One is able to intentionally disabuse oneself of mechanically-acquired habits and attitudes that lead to misunderstanding, incompetence, and incomplete or distorted compassion, and take action that is creative (novel) rather than merely recreative or repetitive.

Becoming-compassionate. One is able to select aims and actions not for the sake of one's regime-investment or personal narrative but for the benefit of one's community and, ultimately, all of animated nature diversely framed. This demands critical intelligence, life competence, and disciplined consciousness.

Thesis Five

> *Where duality (form) is an aggregate of co-conditioned products-in-process, nonduality (emptiness) is immanent, unconditioned. Recognizing and remembering this are the subjective valences of the first and second interventions, respectively.*

Lucio Colletti's (1973) summary view of the subject-as-articulation (in the diction of Thesis Two) opens the question of how a dialectical-materialist theory may relate to typical theological positions in uncompromisingly postmetaphysical language:

> The historical subject is neither Idea, World Spirit, Vico's Providence, nor a transcendental subject. Nor is the subject conceived as Evolution, Struggle for Existence, Societal Instinct, Race, etc. Against these generic abstractions, all equally fruitless, Marx produces a new concept of the subject as a historical-natural entity, as a *species* or collectivity of empirical formations. (p. 14)

Per Colletti, a dialectical-materialist theory of the subject roundly rejects theological interpretations of time and consciousness in time in favor of historical materialism. While at first glance this may seem reductive, it does have certain methodological advantages (see Thesis

---

[92] It may be tempting for some readers to identify the "great unifying enterprise" Ortega y Gasset calls for to bring Europe together spiritually and socially as an integral project, but since I am by no means interested in the necessary hegemony of the global North over the totality of the planet, as Ortega y Gasset is, I do not advocate this interpretation.

Seven), and does not foreclose a productive account of intentional living or nonduality. Toward this end, I have posited that first we are, like everything else immediately perceptible and coherent as something, products of aggregated causes and conditions that arise, persist, and decompose (see Thesis One). In the Buddhist formulation, *form is emptiness*. But we are also, like everything else is, forms in and of nonduality. *Emptiness is form*.

This position differs from the main in integral scholarship. That is, I do not posit a Nonduality in the form of an emanational monism of the type Roy (2006) or Gidley (2007) promote in a premise such as “we are all children of the cosmos on our way home,” or Wilber’s (1977) longstanding position that evolution is an “unfolding of Spirit.” Instead, I hold to the position, one that both Roy and Wilber also posit that the nondual is *right here*. *Now*. Go home and you run *to* it, *away* from it, *in* it, *as* it. It is not to be attained through transcendence, because whatever could be transcended was it already, regardless of volitional actions or, just as reasonably, woeful negligence of a Divine Absolute or Kafka-esque cosmic bureaucracy (see Thesis Seven). The comparison is imperfect, but it is suggestive to say that the nondual is affectively like the Deleuze-Guattarian Body without Organs, which is “what remains when you take everything away. What you take away is precisely the phantasy, and signifiances and subjectifications as a whole” (Deleuze & Guattari, 1987, p. 151). End the cycles of make-believe—the co-created subjective-objective process of make-believe, of reification—and this opening becomes possible. This is neither strictly “personal” nor “political,” but both and neither (see Theses One and Two). This position, while a minority view among integral theorists, is neither (or no longer) limited strictly to the Buddhist tradition nor absent from the integral canon, which is a collection of attempts at new values in history (see Thesis Three).

While the description I have attempted to make so far does correspond in important ways to the dialectical method of the Buddhist master Nagarjuna, as I have suggested it differs from Wilber’s use of Nagarjuna’s diction (or more properly, the word choice of Nagarjuna’s contemporary Anglophone translators). Wilber (2000a) posits capital-E Emptiness or nonduality as having the characteristic of *causality,*[93] described as “’Godhead’” and “’Self-Realization’” (pp. 316-317); as something that “embraces the Kosmos” (p. 524). Interestingly, Wilber correctly recognizes that the dialectic of Nagarjuna reveals “all categories of thought” to be “totally self-contradictory” and untenable (p. 528), a method that traditionally applies to theological and metaphysical positions Wilber takes, inclusive of “the I-I,” the “Godhead,” the “Source,” the “Goal,” even the “Emptiness” Wilber posits as aspects of ultimate emptiness rather than as provisional, samsaric coherences (Wilber, 2000a). Theodor Adorno (1994), his occasional comments on Buddhism that reveal some misunderstanding of it notwithstanding,[94] precisely articulates this distinction: “Dialectics is the self-consciousness of the objective context of delusion; it does not mean to have escaped from that context" (p. 406). My point is that the Buddhist-informed critical practice of making new values that are explicitly provisional and without metaphysical pretense I propose here, which is identical in function with some aspects of dialectical materialism (see Theses One and Two), differs from earlier integral proposals such as Wilber's in ways that may be productive.

---

[93] Wilber’s habit of attributing causality, which is provisional and by definition dual (subject-object) to nonduality in Buddhist language can be traced in Wilber (1981) as well, where Wilber also posits a “causal Dharmakaya”—a contradiction in terms roughly analogous to “limited infinitude,” “violent peace,” or “stupid omniscience.” Absent this mis-attribution, however, the shotgun wedding Wilber officiates between Nagarjuna’s emptiness and Hegel’s Providence disintegrates into irreconcilable differences.

[94] Morton (2007) explicates Adorno’s misunderstandings of Buddhist thinking as well as the corrupted Buddhist sources Hegel used and the consequent logic of Buddhism’s placement in Hegel’s scheme of world-historical development.

In order to make new values, one must understand how values have been made, which is fundamentally a historical (material, formal—of matter, of forms) analysis (see Thesis Three). One difficulty with Krishnamurti's method, for instance, is its resistance to history, to time. I find this to be a limitation in Krishnamurti's otherwise sound nontheistic presentation of (and perhaps approach to) nonduality,[95] which can be mended in a particular way by enlarging the scale of his intervention beyond the personal,[96] by predicating it on critical compassion. Interestingly, the great dialectician Georg Lukacs (1971) advocates a similar transformation as Krishnamurti's, in strikingly similar diction, but on a different scale, directly evoking the scale-homology logic of holism (micro- and macrocosms largely operating by the same rules). Where Lukacs the practical Marxist is materialistic, concerned with conditions, Krishnamurti the practical mystic is concerned with nothing at all, has no motivation, no place and no context. *The integral task in this case is to think of time in a way that admits the nondual*, with which Krishnamurti is primarily concerned, without compromise or distortion, and *while enabling a rigorous and transformative historicity*, as Lukacs proposes. In my view the former is the best legacy of Buddhist dialectics,[97] while the latter is the best of the post-Hegelian dialectical (postformal) tradition. The dialectic, in short, is *already* integral;[98] the post-dialectical maxim that depth exposes itself as another surface, is a *kensho*, an opening into transformation by recognition of emptiness (a first intervention). From this, I propose an account of nonduality that is intended to be neither reductively materialistic nor reductively idealistic.[99]

---

[95] In "The Core of Krishnamurti's Teaching," Krishnamurti (1996) proposes that "Time is the psychological enemy of man," insofar as "Thought is time" and "Thought is born of experience, of knowledge," which are of the past (p. 257). A duality is posited here, between the residues and crystallized forms that have arisen in time and are coherent now, and—*now*, which Krishnamurti priveledges as "insight without any shadow of the past" (p. 257). That insight into the spatial aspect of nonduality is significant as a first intervention, but Krishnamurti does not always admit the possibility of time also participating functionally in nonduality. The forms produced (articulated) by time here are themselves of the nature of space as well; everyday reality, from the clouds in the sky to the clouds in the sky of the mind, is a momentary form or "flicker" that is, ultimately, nondual—neither real nor not-real, neither "truth" nor "falsehood." Krishnamurti remembers that form is emptiness (nonduality) but forgets that emptiness is also form.

[96] Krishnamurti's presentation of the observer recognizing itself as observed can be readily misread as the perfect subjective position or meditative posture for the bourgeois "mass man" that Ortega y Gasset diagnoses, if one assumes the task is *only* personal, *only* subjective, a matter of personal choice analogous to brand preference (see Thesis Four). A careless approach to Krishnamurti would suggest that one simply needs to recognize his or her face in the mirror each morning as oneself, as *mine*, as "I am that"—an attitude that serves only to reify the subject-object gestalt, not undermine it. Krishnamurti's nondualism assumes it is *not personal*—that whatever is observed, without exception, is of the same nature as that which is observing, which means that *that* has the characteristics of awareness and all-pervadedness—Truth beyond concepts, in Krishnamurti's diction.

[97] Trungpa (1987) presents a rigorous but accessible presentation of this view, particularly in the final chapter; Trungpa's analysis informs my reading of Krishnamurti in the present inquiry.

[98] By explicating nonduality or ultimate "depth" as already explicit or merely latent in critical theory at least since Deleuze and Cixous (Anderson, 2006) or Derrida (Hampson, 2007), and less directly in Marx, Gramsci, and Lukacs, I show that one whipping boy of Wilber's (2000a) polemic—the "postmodern

"Truth is a pathless land:" Truth, as a cipher for nondual reality, is uncontrived, unconditioned and wholly unstriated, like space.[100] No formalities—processes or coherences—produce, induce, or cause its presence, or lead one there in the sense of crossing a coordinated space to a destination ("pathless"). The observer always already *is* that space, is of it: *form is emptiness*. The challenge is to remember this, to recognize it in all contexts, and this is a process, a function of immanence and a dialectic between conditions and consciousness. This process of *digesting* nonduality cannot be described structurally, where "structurally" implies a synthesis of affect and content—the content of becoming is infinitely variable. Certain formal characteristics, however, suggest the availability of becoming and can generate a context in which becoming can happen. These recontextualizations are miracles—not products of any evolutionary process but acts of total creativity in a local, immanent, and very specific sense (see Thesis Eight for specific characteristics of total creativity). This is the *Eureka!* moment that triggers a transformation; this creative recontextualization is the meaning of the observer seeing itself as the observed, concrete recognition of the nondual in the immanent, the first intervention.

But conditions have an often-overwhelming inertia of their own, occluding any unexceptional possibility for recognition of the nondual. Provisional, conventional subjectivity is a fragmented, contradictory factory of crazy-making machinery; the socius is precisely the same. As Lukacs observes, capitalism makes ordinary working subjects into timebound, functional *commodities*. What happens when the observer (the worker or class of workers, depending on the scale under consideration) recognizes itself as the observed, that is, sees itself in its conditions? "When the worker knows himself as a commodity," Lukacs argues, "his knowledge is practical. That is to say, this knowledge brings about an objective structural change in the object of knowledge" (Lukacs, 1971, p. 169), which is none other than the subject or the structure of that knowledge. *The observer is the observed. Eureka*! However, as Lukacs warns, "the fact that this commodity is able to become aware of its existence as a commodity does not suffice to eliminate the problem" (p. 173)—a twofold problem, the actual production of commodity-consciousness in the first place, still working on everyone around, and the need for a maintained, sustained recognition and active transformation of the means of production of subjectivity. This is yet another way to articulate the integral project: *the task of reintegrating fragmentary consciousness, personally and politically* (both at once since each is a form of the other by

---

poststructuralist" enemies of "depth" and the sacred—may very well be integral thinkers already, and seen as such if read competently.

[99] This differs from Mastustik's (2007) introduction of an axis of spiritual expression into critical discourse, which suggests a spirituality that is not integrated immediately, already, with actual life as it is lived, together with others. I do not necessarily reject this position, I simply do not endorse it here at present. Instead, I find the function of the spiritual axis Mastustik develops already present in the transformative miracle (Anderson, 2006), a gesture that intervenes in the social, the political, the spiritual—all or any at once. While it can remind a subject *of* the nondual (first intervention), the miracle is *not* a differentiated path to the nondual—conscious effort is (second intervention).

[100] The "plane of immanence" and "smooth space" Deleuze and Guattari (1987) propose are useful metaphors in this context.

holographic logic), *for the sake of a free and responsible life for all*. This task, in Lukacs's words, is to become the "identical subject-object of history whose praxis will change reality" (p. 197). This addresses precisely the subject-object structure that produces and reproduces coherences. Lukacs and Krishnamurti are describing holographically-related practices, one primarily concerned with liberating the macrosocial scale (Lukacs) and the other with liberating the subjective or the spiritual (Krishnamurti), but each in language comprehensible to *either* scale.

In short, while miracles can happen and new values can arise out of the repetitive and contradictory muck of the everyday—the first intervention—much work remains to be done, and for Lukacs, "[t]his reform of consciousness," which I am calling the second intervention, "is the revolutionary process itself" (Lukacs, 1971, p. 259). This participation in the working realization of freedom is not, in Krishnamurti's terms, a *choice*; "It is man's pretense that because he has choice he is free" (Krishnamurti, 1996, p. 257). Lukacs calls Krishnamurtian choice "individual freedom," such as the "freedom" to choose brand X or brand Y but not the choice *not* to trade my labor-time or labor-produce for cash that I then trade for an opportunity to choose between X and Y, if I have enough. Because "in contemporary bourgeois society individual freedom can only corrupt and be corrupting because it is a case of unilateral priviledge based on the unfreedom of others, this desire"—the desire for authentic freedom, say—"must entail the renunciation of individual freedom," as Lukacs argues (1971, p. 315).

Hattam (2004) calls this praxis awakening-struggle, which entails a total commitment to the pathological molecular (micro) for the sake of the pathological molar (macro); Mastustik (2007) calls it "redemptive critique" (p. 228). This is the Gurdjieffian "intentional suffering" of disengaging one's personal investments and pleasures for the sake of *something else*, a project that is not personal in the same way that brand preference, for instance, seems to be. It is a process in time and of time, and for this reason it turns inquiry to the task of *reading* time, of reading coherences as formations *in* time—the responsibility for *critique*.

Interim Summary

To sum up the first five theses in broad strokes, any coherence and the total field of possible and extant coherences—all and everything—have four characteristics.[101] First, a coherence is a temporary and impermanent confluence of causes and conditions, designated conventionally as a "this" or a "that," but only conventionally and not ultimately and not in any "reality" posited as permanent or substantive. Second, a coherence is *problematic*. It is not really what it seems to be or presents itself as, and it is inherently unsatisfying, just as conventional subjectivity is unsatisfied so long as it is "unrealized." Third, because it is impermanent, temporary, a snapshot of a process analogous to a flash of lightning, it does not exist ultimately, but only provisionally or conventionally. This is not to suggest, however, that something exists ultimately, even though all coherences do resolve into nonduality, like moments of lightning animating one sky. This is the fourth characteristic of a coherence: nonduality as the common space (so to speak) of all coherences is not posited as something that exists, nor posited as something that does not exist; it is neither affirmed nor denied. It is neither nothing nor something. Famously, it does not lend itself to a precise formulation in provisional terms such as these, because it lacks formal characteristics (inclusive of the lack of formal characteristic *as* a formal characteristic).[102] It does present itself affectively, however, through particular kinds of interventions.

---

[101] These four features correspond to the Four Seals of Existence in traditional Mahayana Buddhism.

The following theses, then, seek to explore how the positions I have taken so far work in comparison with some previous contributions to integral theory in order to better understand both the present inquiry and earlier proposals.

Thesis Six

> *Coherences are best understood when read responsibly, each in their own specificity and with reference to their own histories (as form), not exclusively or absolutely by any developmental or classificatory scheme of values (which are also coherences with histories).*

Coherences are produced and reproduced, and must be read as such. As I suggested earlier, some are simply reproduced mechanically, the way glaciers form fjords, cats make kittens, and the kinetic energy of habitual patterns control one's actions; others are *intentionally* crafted with greater or lesser competence. I call the former *flickers*, following Pitts (1990) (see Thesis Three). All flickers are articulations, in that they are causally-induced formations made coherent, in this case made coherent by causally-induced distortions. So, to express the flicker more precisely in the cumbersome logic of holism, it can be formulated as *a distorted articulation of an articulation, legible in that same articulation*. In practical terms, this expresses the everyday observation that things are recognizably products of their time and place, inclusive of things such as ideas, ideologies, and metaphysical aspirations. To explicate this peculiar instance of co-causality, I offer some examples of holographic flickers and interpreting them back to the bigger coherence from which they arose and which they articulate (are articulations of), in summary form:

I read American football as a send-up or mimicry of the American imperative to *take their land* (manifest destiny) under the guise of evolutionary providence (Anderson, 2007); as Barthes (1972) reads the anxious desires of the French imperial project in an image of an African man saluting the French tricolor; as Hampson (2007) reads Wilber's boomeritis not as a transhistorical or nonlocal phenomenon, but a precise response to the contingencies of American life at a particular time for a particular class of (nominally priviledged white) folks; as one may interpret certain theologies in the revelations of Joseph Smith as mechanical reflections of nineteenth-century anxieties about race in antebellum America;[103] as I have suggested elsewhere, the impulse to *integrate* fragmented consciousness arises precisely at the moment when imperial capitalism produced the identity crises attendant on an unstable, enforced Empire (Anderson, 2006), and further, that specific moments in what may be called the history of integral practice may be reasonably read either as conscious responses to or mechanical flickers of the socioeconomic order dominant at that moment (see Thesis Three). In each case, flickers are seen as products of causalities, coherent by the degree to which one may be embedded in the appropriate cultural matrix, or disengaged from it. The reverse and equally valid proposition, that each is made coherent as something by the perceptive means (also a product of causes and contingencies) of a given coherence or set of coherences, can be seen in the traditional fable of the coiled rope that a fearful man immediately recognizes not for what it is, but as a coiled viper, or a redemptive allegory the anonymous streetcorner evangel might see in an any-given-Sunday televised football broadcast.

---

[102] I would like to emphasize that this view is neither nihilistic nor eternalistic. Not nihilistic because nothing in particular is posited as a really existing object of negation, then negated; not eternalistic, because nothing in particular is posited as an ultimate existent, then affirmed and reified (even conventionally as Spirit or Absolute).

[103] In chapter 7, verse 22 of "The Book of Moses," part of a collection of Mormon scripture called *The Pearl of Great Price*, the reader learns that "the seed of Cain were black" (Smith, 1920, p. 29). This is one source of much theology in the Latter Day Saint movement against the ordination of men of African

Like any ordinary coherent formation, Spiral Dynamics is an articulation, a "flicker" that *reproduces* something of its causal means of production, of the *moment* of its production,[104] a product of its time (see Thesis One)—but as a system of ideas, it may reproduce or mimic certain ideological formations, or actively critique or renounce irresponsible interest by means of regime-affiliation (see Thesis Three). Spiral Dynamics is, according to the publisher's front matter, concerned with the task of managing successful organizations (Beck & Cowan, 1996, p. 3). Two characteristics of successful organizations in this context include development[105] (in this case, profitability) and pleasure in will-to-power—pleasure in winning over others in competition (as in the application of Spiral Dynamics for professional sports and in corporate fitness), and both are explicitly promoted by the Spiral Dynamics project.

Through Luxemburg's (2003) analysis of the history of accumulated capital, one can read the development spiral as a cipher for development-as-profitability writ large,[106] the increasing complexity and depth of global imperial power by force: "accumulation of capital, once it has started, automatically leads farther and farther beyond itself. The circle has become a spiral which winds itself higher and higher as if compelled by a natural law in the guise of mathematical terms" (p. 89). The "guise of mathematical terms" Luxemburg mentions here

---

descent and interracial relationships for church members prior to the church's rescission of that prophetic policy in 1978.

[104] Hampson's genealogy of Wilber's adaptations of the spiral/vMeme topoi points to an important limit on this homology's breadth-of-scope *vis a vis* Wilber's project—because Wilber flattens the spiral into a spectrum at a certain point (Hampson, 2007, p. 122), his application of the Spiral Dynamics diction represents a distinct articulation from the Beck-Cowan formulation. Hampson does not explicitly opine if Wilber's innovation is an advance on Beck-Cowan Spiral Dynamics, or a reduction of it.

[105] As in Aglietta's analysis of the coherent totality, Beck and Cowan frame the developmental spiral as a cipher for accumulation: "A spiral vortex best depicts this emergence of human systems as they evolve through levels of increasing complexity. Each upward turn of the spiral marks the awakening of a more elaborated version on top of what already exists" (Beck & Cowan, 1996, p. 29). Complexity is accumulated, depth and transcendence are accumulated, and the whole is developed ("elaborated") by this trope.

[106] Lenin (1967) traces the history of capitalism's development in stages such that the system of free enterprise in early English production gives rise to monopolies, which divide the world under the banner of Empire until the whole planet became striated, all lands claimed for the purposes of capital. Lenin concludes that "imperialism *is* the monopoly stage of capitalism" (p. 745, emphasis added).

specifically mask what is for her the history of imperial conquest, which she demonstrates to be the real source of accumulated capital—meaning that capitalism has been global and imperial virtually from the start, and disguising itself as a form of knowledge, economics.[107]

From this observation, I propose as a hypothesis that Spiral Dynamics in fact arose in a capitalist moment—a statement of verifiable historical fact—and that it reproduces a set of values that *mimic* the spiraling functional structures of capitalist production and accumulating capital. It is not in the first instance an intervention or a postformal recontextualization of these valences of mimicry, although it may very well be so relative to certain of the ideologies of the academic disciplines it is most explicitly addressed to. As one might expect, this articulation "flickers" or radiates from itself more about itself than its mode of production. Foucault (1978) suggests that the developmental spiral is a measure of pleasure in dominance or sadism-in-power, through scopophilia and surveillance: "[t]he pleasure that comes from exercising a power […] These attractions, these evasions, these circular incitements have traced around bodies and sexes, not boundaries not to be crossed, but *perpetual spirals of power and pleasure* (p. 45, emphasis added). This addresses the shrill, expansive, and denunciatory fascination in the private lives and practices of gays and lesbians demonstrated by the religious right-wing in the U.S., the political contingency that has come to dominate American political and social life with particular intensity through the Bush-Cheney fiasco.[108] In both instances, the spiral of development is a holographic flicker that repeats the contours of the larger historical moment—the accumulation of capital under the prevailing economic regime, and analogously the (implicitly sadistic) scopophilic discursive mechanisms that continue to regulate sexuality in Euro-American contexts, particularly in Texas, where male homosexuality was still functionally illegal due to enforced anti-sodomy legislation,[109] before, during, and after the writing (in Texas) of the book *Spiral Dynamics*. This does not mean that Spiral Dynamics *consciously* mimics the libidinal agenda of the most powerful political and economic contingency present at its inception, or that Spiral Dynamics represents an explicitly homophobic ideology, as it does mimic the accumulation model of global finance. It simply means that this legacy is legible in the text, and readers seeking critique should be aware of it, whether the theory presented as Spiral Dynamics seems to be aware or not. Spiral Dynamics expresses the will-to-power of the social order that produced it (see Theses Three and Seven). Because it does not offer a critique of that social order, only some tactics for advancing it, I call it a flicker of that regime, a specific kind of artifact of it. It is not a transformational project, but rather a developmental and accumulative one.

Some aspects of this analysis will be instantly recognizable, coherent, and resonant for those of us in the United States who have endured the grief, shame, and outrage that have come with living under the dull-round shadow of the crypto-fascistic regime that has overtaken our beautiful country, especially since 2001—an affective experience I describe as *dead time,* where black becomes the color, and none the number[110] (Anderson 2003)—but may seem obscure to those who have not. One may say that the provisional analysis of Spiral Dynamics I attempt here either flickers my own interaction with the "noetic field" generated by this regime; alternately, it may represent a conscious intervention into that regime. In either case, my claim regarding Spiral Dynamics must be qualified, because it suffers from lacking a rigorous historical analysis of the complex of causal pushes and pulls that brought the articulated coherence called Spiral Dynamics into existence, if not the forces that adapted Spiral Dynamics to the task of classifying and quantifying the development of coherences. Further, it would be as reductive for me to assert that Spiral Dynamics is *only* a mimicry of the values of a certain regime as it is for Wilber (2003) to assume all baby-boomers tend to manifest the same "vMeme" at the same time, for instance. . This tendency to reduce complex phenomena into discrete, simplistic categories is parodied to great effect in R. Kelly's (2001) film *Donnie Darko*, in which self-help guru Tim Cunningham (played by Patrick Swayze) reduces the all-and-everything of human experience to the make-believe poles of Fear and Love—and sells videotapes and practice materials so that *anyone* willing and able to pay can learn how too.[111] With this qualification, I claim in Thesis Seven that Spiral Dynamics is a manifestation of this tendency to reduce complexity and specificity to a generic, transhistorical and universalized taxonomy, with its mode of production under erasure, a metaphysical practice Marx and Althusser attribute to Hegelian method (see Theses Two and Three).

---

[107] Luxemburg presents a recognizably "postmodern" critique of academic practice in this analysis, and just after the first World War.

[108] Phillips (2006) describes this intersection of theocratic hegemony and global capital.

[109] Texas's anti-sodomy law was finally deemed unconstitutional by the U.S. Supreme Court in June, 2003.

There are alternatives, but not uncomplicated ones. History shows that categories such as race, gender, class, and sexuality are problematic at best as analytic categories. Even so, they connote phenomena that affect the daily lives of every coherence alive on this planet, and for this reason, an integral analysis must consider them responsibly. The vMemes of Spiral Dynamics and their attendant trajectory of development are also *means of making knowledge about subjects*, just as race and gender are (see Thesis One). For example, Beck and Cowan (1996) offer this list of sites where the blue vMeme manifests:

> Rev. Billy Graham, Frank Capra's *It's a Wonderful Life*, Puritan America, Confucian China, Hassidic Judaism, Dickensian England, Singapore discipline, codes of chivalry and honor, charitable good deeds, the Salvation Army, Islamic fundamentalism, Garrison Keillor's Lake Wobegon, Boy and Girl Scouts, patriotism. (p. 46)

The only clear conclusion to be drawn from this muddle of stereotypes is that Beck and Cowan (and, later, Wilber) use this vMeme to read subjects,[112] as coded and "tiered" expressions of value, just as in everyday life we read one another in terms of gender, race, class, geographic origin, sexuality—mechanically, repetitively, unconsciously and uncritically (see Theses One and Four). Like race or gender, concepts such as vMemes may be useful theoretic tools insofar that they produce verifiable, useful (read: transformative) knowledge, and utterly useless, even counterproductive, if they discursively or ideologically subjectify; occlude the production of verifiable, useful knowledge;[113] or encourage (fail to *discourage*) spiritual materialism, Trungpa's term for the misappropriation of the trappings of transformative praxis in the interest of mass-man ego,[114] the spiritual cognate to theory in bad faith (see Theses Four and Five), and *anything* but postmetaphysical practice.

---

[110] Bob Dylan's 1963 recording "It's a Hard Rain's a-Gonna Fall" has contributed materially to this portion of the analysis.

[111] If Cunningham had taken any coherent theoretical positions, then his work certainly would have been recognizable as theory in bad faith; if his work had been coherently spiritual in nature, it certainly would be fair to characterize it as spiritual materialism.

[112] To their credit, Beck and Cowan (1996) recognize this practice as an error—"vMEMEs can be so dominant that they seem like archetypes and are easily misinterpreted as 'types' of people" (p. 32). This recognition does not prevent this error from arising in their work or in Wilber's work, however.

There is a *danger* of overhasty metaphysical diagnosis—analogous to the risk of spiritual materialism on the one hand or racism, sexism, homophobia that can distort human encounters, often disastrously, on the other—*inherent* in the tiers of vMemes in Spiral Dynamics and later adaptations of it. This is precisely the problem Marx and Althusser identify in Hegel's practice (see Thesis Two), of assuming a solution to a given problem (in this case through a rubric of preexisting values) before any question about that problem in its context has been posed.[115] One looks for the values one has and finds them, and in the process, determines the outcome of one's inquiry before beginning it, even *containing* the object of inquiry—much as one who may wish to prove the geological veracity of a particular Biblical account of creation by seeking evidence that the planet's fossil record is less than six thousand years old, inverting the scientific method, may inquire. This can be amended by relying instead on the responsible but sometimes tedious and time-intensive process of reading micro-scale specific coherences as articulations of discrete sets of microhistories, as Gidley (2007) attempts to do macrohistorically.

Gender is one moment where Wilber has been willing to uncritically reify a complex set of phenomena into an absolute, timeless Idea or "truism," in this instance shortly before his full-scale adoption of the vMemes of Spiral Dynamics; this shows him to be amenable to a critical tool that can also be used as a means of *containing* critique at the point in his project when he begins to incorporate Spiral Dynamics into it. According to Wilber (2000a), most strands of feminism (treating specifically essentialist, second-wave feminisms) have failed to produce acceptable results because “the very attempt to liberate women disempowers them by definition […]. Women do not have to take back their power because they never gave it away” (p. 598). This is because, according to Wilber, women thousands of years ago helped build patriarchy in response to the contingencies of prehistoric life—assuming in the process that women today can reasonably be held responsible for the decisions made by prehistoric women, or had some say in the matter during prehistory. Further, Wilber assumes that the mental act of recognizing one’s own genuine oppression on gender lines (in my view a first intervention), thereby reasserting one’s power, amounts to giving away one’s power in the form of rejecting the inheritance of a patriarchy that was according to Wilber of some use thousands of years ago. As before, no woman or man alive today was alive at the moment gendering began, obviously; to posit the *non sequitur* causality Wilber proposes, then, demands recourse to an alternative, back-to-the-future view of time, where the women of the present in a sense participate in the patriarchy of prehistory, *ala* Wilma Flintstone, that women today are essentially the same as women have always been, that the power ancient women may have had is the same power contemporary women are free to accept or reject. Wilber does not account for how women or men are positioned—articulated—*now*, and then from the imminent specifics of that condition propose an intervention, as critical practice demands; instead, he proposes a rather preposterous kind of transcendent-historical make-believe in order to dismiss the everyday reality of the continued disempowerment of women that affects persons of both genders, while affirming separate spheres of masculine and feminine values, as second-wave essentialist feminists have done (Wilber, 2000a, p. 759). Wilber is clearly working in this instance to contain the scope of feminist critique by attempting to make critical feminists (as opposed to essentialists, for whom the prehistorical theme is of more significance) collectively appear as irrelevant, counterproductive agents of disempowerment.

---

[113] Hampson's (2007) work on the postmodern and integral theory represents a genuine advance on Wilber's work, but in one instance, he makes a minor error that is relevant in this context as an example of the distortion Pitts describes, which may be analogous to the "guise" of quantifiable reality Luxemburg observes in economic theory. Hampson assumes that capitalism is simply an articulation or a set of values (orange vMeme, "modernism") (p. 110), rather than what it has been and continues to be: a way in which societies can organize to produce useful and useless stuff, as well as the means of its own continued existence (through reified or commodity-consciousness, among other means), in which ever-increasing *development*—accumulation, profitability—is the value held above all. Because it is a reproducer of value-as-ideology, more than it is the expression of a discrete set of values, capitalism is an integral problem, a total one, and a verifiable fact of contemporary life. In my view it is reductive to dismiss it strictly as an expression of a "modern" vMeme, and thereby exclude it from a discussion of the postmodern and by extension the contemporary condition. In my opinion, this is an example of a case where this critical tool, the vMeme, inhibits the production of useful knowledge.

[114] In his speech to the Order of the Star, Krishnamurti directly accuses his followers of a specific manifestation of spiritual materialism, that of make-believing one's place in a developmental model to serve one's ego: "You are accustomed to being told how far you have advanced, what is your spiritual status. How childish! […] You are not serious in these things" (Krishnamurti, 1996, p. 6).

[115] Marx summarizes his critique of Hegel in these terms:

> He assumes in the form of fact, of an event, what he is supposed to deduce […]. Theology in the same way explains the origin of evil by the fall of man: that is, it assumes as a fact, in historical form, what has to be explained. (p. 71)

If one’s project is in part dedicated to containing the scope of active critique by reducing the outcome of that critique to a preestablished set of values (timeless “feminine power” in this case), as Wilber’s seems to have been in the case of gender critique as of Wilber (2000a), then one may find a classificatory scheme of values such as Spiral Dynamics useful, because it is useful for *managing outcomes*, foreclosing surprises, and blunting intervention.

I submit, instead, that the integral project can only benefit from a rigorous, compassionate consideration of historical feminist analysis and an active inquiry into gender as a social and subjective factor—and that such an inquiry has transformative power—even if the findings of any or all such projects wholly invalidates the total of the present inquiry. The striking and explicitly feminist work of Helene Cixous, for instance, may or may not be a manifestation of the “Mean Green Meme,” which is not a coherent analytical category at all;[116] it is, certainly, a concrete response to a real crisis in time and space, produced by multiple waves of causality and contingency, and should be analyzed as such, just as any gendered or "raced" or "classed" position is. Because Cixous's work is characterized by frequent moments of artful postformal expression, the nature of the distortions in the holographic "flicker" of its moment of production may actually be another form of lucidity rather than opacity, in the sense that they open up critical lines of inquiry into said moment, as well as the moment in which it is consumed—the other end of the process of articulation, which could be described as the "flicker" of reading, of integrating the postformal, critical energy of a remarkable text into one's own horizon (see Introduction). In this way, reading properly a well-constructed text can itself make new values possible beyond the scope of the values presented explicitly in said text. *This is what theory is for*. Further, interventionary awareness or lucidity that characterizes postformal praxis actively (consciously) *recontextualizes* the gestalt in which it arises, and by this feature can be distinguished from any other product or artifact of culture which typically reproduces values and structures. This is far preferable to the alternative of assuming one's values about gender or the metaphysics of the New Age or the age and source of the planet have some reality that is stable transculturally and in all contexts, and form a valid preemption of open inquiry (see Thesis Seven).

---

[116] The holographic treatment of the dynamic spiral I have offered so far, while hardly foolproof empirically, is more coherent analytically than the hodgepodge polemic catch-all that is the “mean green meme” in the applied Spiral Dynamics of Wilber’s integral model. As Hampson (2007) so precisely (and politely) demonstrates, the mean green meme is incoherent as an analytic category, but its use in polemic is demonstrable and demonstrably conservative (p. 163). Conservatism, as a position committed by definition to the maintenance of the status quo, is the logical alternative to any transformational model, which looks for ways to make constructive change, and insofar as integral praxis is transformational, the mean green meme’s use in integral praxis is incoherent and—creepy, like the sadistic but implicitly

Thesis Seven

> *New values may be made, emergent cultural forms do arise, but "New Ages" do not "emerge" mechanically or Providentially. New regimes, like new values, are responsibly made.*

> *Capitalism reproduces itself by transforming itself, and this transformation is mainly in the improvement of exploitation.* (Marcuse, 1969, p. 13) (see Thesis Three)

Metaphysical propositions or topics are products of specific moments in time and in space—co-conditional and, of themselves and in relation to others, total (see Theses One, Two, and Five). This means, for instance, that Aristotle's propositions regarding the First Mover or the Substance reflect the circumstances from which they arose—Aristotle's Athens—as well as the circumstances that have transmitted those propositions to the present. The First Mover has been reinvented, recontextualized countless times. The critical question is not what the First Mover may have meant to Aristotle or his student Alexander or to Avicenna or Aquinas, or what it may mean now to Anderson or Wilber—all contingent and nondeterminant in the last analysis—but instead what *purpose* that concept can execute, what job it can perform (see Introduction). To answer this question, I classify propositions broadly as theological or theoretical, by this characteristic of *presumed timelessness*. If a proposition, which is demonstrably a coherent thing and therefore anything but immutable, claims to be timeless or is contextualized in such a way as to lead a reader to assume it is universal, then I classify that proposition as theological or metaphysical.

---

spiritual Law of *The Trial*. It leaves Hampson (2007) "none the wiser, though a tad more fearful" (p. 163). As a critical tool, it rather evokes another spiral entirely, this one the emblem on the impressive belly of Ubu Roi, father of the science of pataphysics, and the *leitmotiv* of Baudrillard's (2005) critique of Kafkaesque "Integral Reality."

There is a dialectical, developmental relationship between theory and practice (see Thesis One). Theory makes practice intelligent, while the contingencies of practice—actual material conditions—inform theory. To produce theory, then, is to produce a systematic set of concepts with a definite relationship to material conditions and to a definite methodological agenda (here, comprehensive "inner" and "outer" transformation) and, therefore, to produce concepts that are explicitly contingent because they are necessarily *not* universal or transhistorical, any more than any other coherence such as a hammer or a cutting tool is metaphysically "real." Theory, therefore, must venture to be honest about its capacities and humble in its claims.[117] By contrast, *theology* is traditionally taken to be a practice of explicating doctrines that are assumed to be universal and transhistorical, and that therefore transcend the material and the contingent, even as theology is understood at its roots as an epiphenomenon of natural philosophy (an interesting context for Aurobindo's decision to express his theology in the patois of nineteenth-century natural and social science: evolution, races).[118] Where theory aspires to an accurate reflection and response to material conditions, theology makes effective myths. The meaningful point of contrast here lies in practice. Where for theory meaningful practice is to change the world into a saner space, for theology meaningful practice implies an increasingly developed adherence to a *premade* doctrine and, concomitantly, implementation of a doctrine *into* the material world, thereby effecting a transformation of the world by inspiration outside of the world.[119] Theory implies co-causality (theory-to-practice, practice-to-theory); theology, a one-way, top-down causality of transformation (Word-to-the-world). This reflects a difference in the means of production of concepts. Theory as I propose it here is a democratized production of values, insofar as it is a collaborative and dialogic practice, while theology can be understood as a private-property regime of production of values (see Thesis Two), insofar as the production of theology is limited to those who have appropriate institutional or traditional validity or have fashioned for themselves an independent tradition to represent, as in the case of charismatic religion. As I show in Thesis Eight, this issue of *access to means of production and distribution of values* is significant for the future of integral theory.

---

[117] This is one condition of a postmetaphysical culture as well; see Rorty (1989, 2006), and Habermas (1994). In fairness, the extent to which Wilber's work (itself a work-in-progress) is at any one moment consistently and without compromise critical, theoretical, or postmetaphysical must remain an open one, as an analysis of even a representative selection of the positions Wilber has taken would exceed the scope of any essay not committed wholly to an exegetical treatment, given the scale of Wilber's production. The doctrines I identify with Wilber in this work as metaphysical or theological have at some point been endorsed or expressed by Wilber, even if he may have since distanced himself from any one of these doctrines fully or by degrees, at one time or for all time.

[118] Augustine (1998) rejects theologies derived from cultural ("mythical") or civil life, emphasizing instead a theology derived from natural, of-the-world principles, such that theology following Augustine—the whole of European theology and its consequences—is natural philosophy spiritualized, or given cosmic, eternal significance. Theology is at its roots quite literally the Miltonic assertion of eternal Providence into material science and the justification of what a given regime takes to be the ways of God to the men subject to that regime.

[119] Hobbes's (1996) proposal for the establishment of a Christian commonwealth represents one of many explicit instances of this, where theology is openly described as a means of force, a means of subjective and social control. The ideological task of making these social controls into doctrines of natural science, presenting them as cosmic physical laws from above rather than as social forces, forecloses any appeal to the supernatural in the form of prophecy or dream-vision for moral or spiritual authority from below. Hobbes recognizes and addresses this threat in his hypothetical commonwealth, observing that "he that pretends to teach men the way of so great a felicity," that is, one who claims to speak on behalf of Spirit, "pretends to govern them" (p. 288). Hobbes, then, establishes theological means to control, curb, and cage this threat to its own government, and the age of prophecy is declared closed. The relevance of vision and prophecy as a charismatic gesture is an unspoken subtext of Thesis Eight. Readers familiar with prophecy as a literary conceit will not be surprised to see that both natural-theological and prophetic gestures can and do arise in the writings of the same poet or thinker (Spenser, Milton, Blake, Yeats, Aurobindo), even in the same sentence, in dynamic tension.

Either method, theory or theology, can be appropriate to a given situation. There is much good in competent, compassionate criticism. As I have suggested, some of what passes as criticism is clearly incompetent and lacking in compassion, and is therefore irresponsible and unacceptable (see Thesis Four), and in the last analysis, not even criticism. Similarly, much theological work is of real qualitative value, and as streams of cultural and practical transmission, must be valued. Appropriate valuation in the sense of critical consciousness is also a form of responsibility. That said, there is some measure of madness in theological projects; some are hopelessly irresponsible, and most are a mixed blessing. Theology as such is not necessarily a problem or a solution to a problem. My point in this instance is that when theology is asked to perform as if it were criticism, difficulties arise (see Theses Two, Three, and Six), counterproductive and unneeded ones. Specifically, the incorporation of certain theological positions into integral theory has caused a particular methodological problem[120] I have alluded to already regarding Wilber's misrepresentation of nonduality relative to dialectical practice, as well as his proposal for a "master map," attributed to Hazelton in Wilber (2003) (see Introduction), taken up more recently in slightly different diction in Wilber (2006) and elsewhere.

This "master map" process of adjudicating the "best" and "worst" of internally coherent but mutually contradicting claims even of various progressive-evolutionary postcolonial religious dispensations—those of Baha'u'llah and Abdu'l-Baha,[121] or of Mirza Ghulam Ahmad,[122] or of Meher Baba, to give a representative sampling—enacts or makes possible a kind of epistemic violence that exceeds any mandate for critical practice. On one side, through an intensity of commitment to one's teacher and tradition, one may make extraordinary, unverifiable, and in the end irresponsible theological claims at the expense of other traditions passing as criticism—theology, working as ideology, in theoretical drag.[123] On the other side, through a conscious or unconscious bias for or against a particular teacher or tradition, one may attempt through theological gestures (or simply through vehement and repeated assertion) to *foreclose* a particular dispensation from responsible, contextualized critique.[124] Theory is inadequate to the task of resolving differences in theology, much less to the *reduction* of said differences to another, master theology,[125] just as it is incapable of determining which of these men (or none among them) may have been God in the flesh, a position no theorist can take without becoming a theologian, an ideologist, or both at once in the process.[126]

---

[120] As with so much else in integral theory, this is anticipated in the work of Aurobindo Ghose. Like Milton, Aurobindo is a world-class poet and mythmaker, and a theologian to be taken seriously (and not only by the faithful); also like Milton, Aurobindo is a problematic political and cultural critic.

[121] In the instances of the Baha'i Faith and the Ahmadiyya movement especially, one may instead begin to understand the similarities and differences between dispensations first by reference to the relationship of the faithful to the transformations brought about by the colonial process, and second by the minoritarian position of adherents in a postcolonial situation in Asia and in diaspora. Apart from a conflicted position *vis a vis* mainstream Islam (Shia and Sunni respectively), these are the most explicit common denominators between the two movements.

[122] Situated in and from the Ahmadiyya tradition, Ahmed (1998) is worth close consideration for those committed to an evolutionary-consciousness position such as the ones posited by Hegel, Aurobindo, and Wilber.

[123] Claims of this type, exemplified perhaps by Bakhtin's (1984) hyperbolic enthusiasm for the religious conservative Dostoevsky and Wilber's public endorsements of Franklin Jones (Da Free John, Adi Da) and, later, Andrew Cohen, along with books and publications by both (Cohen publishes "the *only*

No *single* theology, master map, or God-is-on-our-side gesture has proven to be up to the task I propose of organizing a set of disparate social and spiritual movements, many of them theological in orientation, predicated on innumerable cultural traditions. History shows that adherence does not guarantee alliance, nor does simple adherence bring the subjective and objective developments needed for a comprehensive transformation to be carried out. For instance, if one seeks to draw together the participatory action of good-faith leaders from many religious and cultural traditions, and many intellectual disciplines, with a theoretical project, one immediately introduces a problem with establishing this theory on a metaphysical or theological proposition. One example: that there is such a thing as reality and that this reality "is not composed of things or processes," but is composed of holons (Wilber, 2000a, p. 41), which have their being in something of a divinized hierarchy in the form of a Great Chain that is also presented as real, as in the "ontology of consciousness" Litfin (2003) posits in her proposal for

---

magazine asking the hard questions, slaughtering the sacred cows, and dealing with the Truth no matter what" [Wilber, 2002, p. xvii, emphasis added]), suggest that *only* this or that method, *only* this or that text or periodical or ashram, *only* this or that guru can yield desirable results—a difficult claim to verify. Insisting on the exclusivity of Dostoevsky, for instance, begs the question: why *only* Dostoevsky and not, say, Joyce? Bakhtin shows a willingness to address this question, but never wholly resolves it, and in fairness, could not have read *Ulysses* at the time of writing his book on Dostoevsky. Analogously, one may ask of Wilber's work: why an uncategorical endorsement of the claims of Franklin Jones at the expense of those of Shiv Dayal Singh, or Baha'u'llah, or Mirza Ghulam Ahmad, or Meher Baba, or any other, or not at all?

[124] To give one example, Wilber (2001) claims it is "slander" to point out the racist overtones in Aurobindo's writings (p. ix). But as I show in Anderson (2006), Aurobindo's writings are more complex than Wilber seems willing to admit on the subject of race; it is not unfair to Aurobindo to insist he was among other things a product of his time, and that flickers of this time are legible in his work. By analogy, one can find moments of explicit racism in the writings of Mark Twain, even as Twain's project was broadly and intensely anti-racist—and to say so amounts to critical honesty about Twain, not a slander to his legacy.

[125] I recognize that a reader applying a hermeneutic of suspicion to this passage may object to my uneasiness about theological work as an expression of my own adherence to an explicitly non-theological (not anti-theological) spiritual tradition, Mahayana Buddhism. If the reader finds that my claims are unwarranted or otherwise problematic, and that a bias of this sort may be behind this problem, I invite that reader to demonstrate both the hypothetical failure of my reasoning and any imputed bias causing the same.

[126] This distinction can be made by diagnosing the relationship of a given theological gesture to the regime at hand. If it is one of mimetic and mechanical or conscious identification, it can be said to be ideological. This analysis develops from the first positive task of schizoanalysis, to find out what the desiring machines are doing (Deleuze & Guattari, 1983, p. 322).

an integral macropolitics (pp. 55-56).[127] This is an affirmative, ontological position, and this differentiates the coherence as propose it (see Thesis One) from the Wilberian holon: the coherence refers to a moment in a set of overdetermining processes, but is not affirmed as real or unreal; thus, it is not a litmus test of faith, only a tool at hand for anyone to use with no presumed ultimate significance or ultimate being (or non-being) as such.

What I am proposing instead amounts to a rigorously pluralistic, secular approach that invites the contributions of multiple traditions without affirming the Ultimate Reality of one over the rest by responsibly refraining from taking metaphysical positions relative to the integral project and instead insisting on the verifiable, the deductive—arguably another valence of the Big No, as I will show—the best inheritance of the tradition of antinomianism established on the North American continent by the Puritan theologian and proto-integralist Roger Williams in the middle of the seventeenth century. Further, this non-theological presentation of nonduality coincides with a radical skepticism: neither affirming nor denying the ultimate existence or nonexistence even of a category called “nondual,” or of this pen in my hand (see Thesis One), therefore allowing room for all theological claim to circulate freely without favoring or excluding any, such that any responsible transformative practice regardless of its traditional origin may be of benefit according to its capacity in concert with all others, not to mention space for the creation of new values. (Of course, anyone’s irresponsibility in this regard is an invitation for criticism.) Taken together with the minoritarianism I propose in Thesis Eight, the *restraint* and skepticism inherent in this proposal express my overriding aspiration for a radically democratic and ecologically sustainable social order. This is the “New Age” worth working for, worth *making*.

As it happens, “the New Age” is another such metaphysical doctrine in much integral thought and culture about time and historicity, that the recent past and present (and perhaps near future) represent the opening of a new paradigm, world view, world order, or “omega point,” a view expressed in different words and deployed in different ways (and to differing degrees) by Aurobindo, Teilhard, Gebser, and Wilber, and in *Spiral Dynamics*. The past has produced many such moments of apparent transformation coupled with millenarian aspiration that have come to naught; the events of 1848 in Europe demand consideration here, as a cursory example of how European post-Hegelian proto-integralists, Marx and Engels most obviously, saw a new age dawning as only more elaborate and comprehensive oppression emerged, some of it undertaken in the name of their project.

---

[127] A thought experiment: imagine a gathering of representatives of many spiritual traditions, for ecumenical and peacemaking purposes. Before any dialogue has begun, before any bread is broken or coffee poured, the host of the gathering (following Litfin) proposes that all participants affirm a particular theological or ontological point—perhaps the emergence of a New Age of consciousness through evolving cosmic forms, or Kantian categories, or Hegelian World-Spirit, or Jungian archetypes, or the salvific power of X or Y guru’s grace—*first*. What happens? Such a gesture leaves little room for dialogue or space for the miracles that can arise under responsible leadership. At the same time, such a conversation would also be impossible without certain nontheological values in place, such as generous hospitality, a willingness to consider multiple positions at once and in context and to take them seriously, a recognition of all partial and provisional views as such even when they claim to be complete and universal, and a utopian aspiration to work collaboratively for the mutual benefit of all participants, for instance.

In Wilber (2003), Hazelton also presents the intervention of Spirit unto cosmic evolution as an inevitability. After presenting a segment on the Spiral Dynamics developmental model, Hazelton declares, "[n]o wonder thinkers from Hegel to Teilhard de Chardin to Aurobindo have concluded that this evolutionary unfolding is heading *straight toward Spirit*" (p. 110, emphasis added). I call this moment a theological doctrine rather than a theoretical position because there is no demonstrable or inferable basis for *plausible* causality in this instance, only the Spiral Dynamics model of developing consciousness that, at a certain point, arbitrarily becomes spiritualized. Theologically, this does not present a problem; one simply accepts the doctrine of that developing consciousness becomes spiritualized at a particular moment and honestly, humbly, strives to participate in its unfolding. But theoretically this move can and in my view should be dismissed as a logical fallacy (*non sequitur*), and recognized as a metaphysical rather than a postmetaphysical gesture. Approaching the issue in another way, one can posit Spirit theologically—it is not demonstrable materially but may be useful therapeutically—as an article of faith or doctrine; as a subjective experience or affect, which is by conventional means impossible to verify; or as ideology, as the Hegelian method seems to do (see Thesis Two). In the case of the first two, how can one demonstrate that a particular phenomenon is plausibly caused by the intervention of an undemonstrable, transhistorical, Providential Spirit, and not something else? And given the third possibility, that of ideology posing as a spiritualized doctrine, does emerging Spirit have enough explanatory power to justify the risk of producing theory in bad faith, that is, does a doctrine of Providence explain and transform everyday life well enough to overcome its own obfuscation and ideological impact?

If so, I leave those premises for metaphysicians to work out; this is a postmetaphysical theory. It works whether or not Spirit, for instance, exists or not, because it does not posit the *necessary* existence of Spirit, God, or cosmic consciousness. I accept that these things may exist, or may not. Since Godhead is hardly verifiable, building a theory that requires the necessary existence of God or a cognate to God could expose said theory to invalidation in the event this or that God is (or has been) proven *not* to exist, or to exist but on very different terms than the ones that may have been posited by the given doctrine. Because this is theory, with a definite relation to material life and practice, it must be accountable to such contingencies. Instead, I have proposed a postmetaphysical expression of nonduality that can be articulated wholly by means of the dialectic (though not posited as existing or non-existent) (see Thesis Five), and suggested ways in which subjective transformation is possible if not necessarily inevitable. This is not a fully elaborated Theory of Everything, but the *groundwork* for a more fully transformational theory—theory in the limited sense I have proposed so far.

By contrast, in Beck and Cowan (1996) adhere to what I am calling the New Age doctrine, citing the revolutions in post-Soviet Eastern Europe as signs that, in the mid-1990s, *appeared* to augur the opening of a new world order (p. 27) to them as it did to Fukuyama (1992). But what new order emerged in the new republics of the former Soviet bloc? The old order did, in the form of capital, of "free market" capitalism. This moment of transformation did not *produce* new values, it *reproduced* a pattern visible at the turn of the last century (Hardt & Negri, 2000; Lenin, 1967; Zizek, 1993), and as Schweikart (2002) observes, this amounted to a catastrophe economically, socially, and psychologically for many in Russia and in Bulgaria, for instance (pp. xvi-xvii). In another instance of the New Age doctrine in Spiral Dynamics that, in hindsight, appears an unfortunate choice of examples, Halliburton—now, scandalously, a privatized arm of the Pentagon, most conspicuously in its relationship to Vice President Cheney and concomitantly in its role in Iraq, and new headquarters in Dubai—is cited as an example of a cycling from blue to orange that (skipping green, tellingly) could become yellow and "open vast new markets" (Beck & Cowan, 1996, p. 155), as it *did* in Iraq, beginning in March, 2003—by state-authorized and state-*authored* force. My questions about this ascription of "new age" significance to present-moment contingencies, in Spiral Dynamics and beyond, and well beyond the scope of the present inquiry, include: Is this practice coherent and productive or incoherent and reductive, how does it work, under what conditions did it arise, who does it serve (and how), and what are the stakes? (see Thesis Three). One can reasonably hypothesize an ideologically-inflected deployment of the New Age doctrine in this case, that the iterations by which capital transforms itself to remain in control of global resources are taken to be Theilhardian "omega points" of developmental, even spiritual, significance in some integral treatments (see Thesis Three).

Often what looks like a new regime is actually no such thing. For example, new states emerged in Africa in the putatively post-imperial period of the mid-twentieth century, but the regime of control in these postcolonial contexts remained largely intact. There was simply a change in strategy, an adaptation that reproduced the old system and concomitant set of values, rather than an authentic transformation. Kwame Nkrumah (1966), who led Ghana through its birth, argues exactly this:

> Faced with the militant peoples of the ex-colonial territories […], imperialism simply switches tactics. Without a qualm it dispenses with its flags, and even with some of its more hated expatriate officials. This means, so it claims, that it is 'giving' independence to its former subjects, to be followed by 'aid' for their development. Under cover of such phrases, however, it devises innumerable ways to accomplish objectives formerly achieved by naked colonialism. It is this sum total of these modern attempts to perpetuate colonialism while at the same time talking about 'freedom,' which has come to be known as *neo-colonialism.* (p. 239)

Nkrumah, after attempting to implement authentic independence from global capital by developing Ghana's economy in a way that would reduce the new nation's dependence on trade with its former colonial master, Atlantic capital, was ousted in 1966 in a CIA-backed coup while in Vietnam. Nkrumah's analysis shows that inauthentic development, even retrogression, is celebrated as if it were a revolution in values, which is of course an ideological function; his political life is but one example of how authentic change is typically resisted, disrupted, or aborted, while the resistance to change is articulated as if it were an introduction of "freedom" or "development." *Diplomacy in bad faith*.

To assume that from the present order will Providentially *emerge* an enlightened, liberated one is to ignore the historical precedent of the current "holarchic" order, from which no escape is permitted. This, however, does not completely foreclose the possibility that a segment of this order can be transformed into a field for new values. Ho Chi Minh (2007) observed prophetically (his comments were first made in 1963) that "History has proved that when a people are of one mind and united in the struggle for independence and freedom," both independence and freedom are inevitable (p. 196). Explicating this, one sees that a total, uncompromising commitment to a single project, for the purposes of this inquiry a *responsible* one, can produce a unique transformation. Largely by this means, Ho's Vietnam was able to accomplish what Nkrumah's Ghana was not—after a very long and exceptionally destructive attempt to disrupt and destroy it (destructive for all involved),[128] known in North America as the Vietnam War. My only point regarding Ho at present is that transformation is possible even under these circumstances, that a new regime of values can be made, but it happens only with intense commitment, against real resistance from those who perceive their real interests to be threatened (see Thesis One on the formation of subjectivity and Anderson [2007]), and with favorable circumstances. *Si, se puede*—it can be done.[129]

This act of making values must be distinguished from the kinds of shifts in practice that produce changes in *forms* of *expressed values* such as in Spiral Dynamics, where Beck and Cowan characterize Halliburton's leap from strictly local oilrigging in Oklahoma to a "diversified ORANGE conglomerate" as a functional transition in value identification or articulation (p. 154). But in this instance, the values of the operation are the same before and after—the pursuit of profit, growth, at the expense of the earth's crust—while the means or apparatus of capture (of capital) differ. In this and other cases, the shift in Spiral Dynamics from one color to another indicates not a change in values or of means of production, but of means of expressing the same regime of values. Orange for the management of assembly line labor and consumer capitalism; yellow for integrated global capital and neo-colonialism (see Thesis Six); no change in the regime of accumulation, no change in *values*, only a change in attack commensurate to a change in circumstances. I have already claimed that this "momentous leap" in tiers of value imagined in Spiral Dynamics is little more than a mechanical flicker of capital's reinvention of itself in terms of global finance (see Thesis Three); the significance of this claim should now be clear: *This is unacceptable* (see Thesis Eight).

From all this, one may ask: what is a "new paradigm" *for*? A theoretical project is of use as a part of a systematic plan for action that can be implemented by responsible people for transformative purposes, can help people become responsible in the first place, and motivate them to responsible (rather than personal) action. On their own, new paradigms as collections of topics on themes about "reality" typically change little or nothing, and (with some very significant exceptions) are epiphenomena of broader political-economic (objective) with concomitant ideological (subjective) activity (see Theses One, Two, and Three)—recalling that coherences mechanically arise in a back-and-forth of patterned conditions and reified consciousness, but that responsible intervention, the exception to the rule, remains possible and sometimes happens. To give a historical example, the early scientists of seventeenth-century Europe did not produce our fragmented *Weltanschauung*, so much as they helped express the social and psychological fragmentation brought about by the advent of capitalism, coincident with the Reformation, and in some cases, reified it (as in Weber's analysis of the mythical Protestant work ethic). However, the social and economic transformations of the seventeenth century—expressed in enclosure in England and in extended warfare throughout Europe—did make science and the terms of its inquiry possible, and inflected the form and function of their findings in particular ways. The open question remains the use we make today of their methods and findings, as developed by those who have followed.

---

[128] Specifically, the Vietnamese were able to achieve a degree of self-direction from the regime of capital. That said, Communist Vietnam is no example of a radically democratic, sustainable, integral polity, whereas socialist Chile (1970-73) may have more to offer as an example.

[129] In the U.S., this is the motto of the United Farm Workers, implemented under the inspired leadership of Cesar Chavez.

Thesis Eight

> *The current regime produces unacceptable results. If a "new age" is to emerge, transformational practice must be radically democratized, and resist commodification.*
>
> ***Provisional Thesis:*** *The labor of making new values through revolutionary desire is one readily-available and responsible practice of this kind that can help produce a radical democracy.*

The proposition throughout Wilber's later work that one must change the "insides" of subjects in order to change the "outside" expression of our species-being or the "superholon" of social relations assumes a monodirectional (theological) causality from subjectivity "out" to sociality (see Thesis Seven). But just as subjects make their social world, so are subjects formed out of the contingencies of living in a world among others—from sociality "in" to subjectivity (see Theses One and Two). It is reductive to imagine this process as limited to one side of the dialectic only. Therefore I posit: *to fully liberate the subject one must fully liberate the socius, and vice versa—and this liberation is ultimately desirable and in the ultimate (if not always apparent) best interest of everyone involved in the totality of social relations without exception* (see Thesis Five). This means that all beings without exception have a stake in this project of complete liberation, including those who cannot necessarily speak—plants and animals domesticated and wild, for instance—and those who paradoxically can speak but have no voice under the current regime, the subaltern,[130] since all beings without exception participate in co-causality.[131] Kurt Vonnegut (1973) demonstrates the ridiculousness of the current order by presenting the situation on Earth for what it is, something pathological that must be explained in order to be understood by a reasonable being unfamiliar with it:

> Most other countries didn't have doodley-squat. Many of them weren't even inhabitable anymore. They had too many people and not enough space. They had sold everything that was any good, and there wasn't anything to eat anymore, and still the people went on fucking all the time. *Fucking* was how babies were made. […] A lot of people on the wrecked planet were *Communists*. They had a theory that what was left of the planet

---

[130] This sympathy with the disempowered and the imperative to take conscious responsibility for one's self-presentation and actions, making them novel, singular, and minor, as a means of revolutionizing one's person as a kind of self-realization and for the ultimate benefit of the totality, ought not to imply an affiliation with the libertarian doctrine of self-ownership, such as that presented by Nozick (1974), criticized here (see Theses Four and Five) in summary form as "personal choice" or brand preference to be renounced. Cohen's (1995) analysis of Nozick's libertarianism broadly supports the position I take, and also informs my emphasis on "making space" for transformative action (see Theses Three, Four, and Five).

[131] This is not a transhistorical claim so much as an observation that all beings known to history have participated in history on terms not always of their own choice.

> should be shared more or less equally among all the people, who hadn't asked to come to a wrecked planet in the first place. Meanwhile, more babies were arriving all the time—kicking and screaming, yelling for milk. In some places people would actually try to eat mud or suck on gravel while babies were being born just a few feet away. And so on. (pp. 12-13)

It remains that the world is divided and controlled inequitably, unsustainably. Some find fulfillment, others find overindulgence and overconsumption, while the majority finds—something else. The violence, physical and epistemic, that subjects under this regime inflict on themselves and others, directly or vicariously, is simply unacceptable, which is to say that *the regime producing this situation is unacceptable*. The responsible thing to do is to change it, but change it responsibly.

Revolutionary desire is one way to intervene with new values, perhaps the most comprehensive intervention of novel values. For the purpose of demonstration I present it here in contrast to the familiar integral schemes for organizing and reifying *old* values, and as an example of transformational practice that quite explicitly includes all four traits of becoming-responsible (see Thesis Four), not because I find it the most immediately practicable (as I do not find it so). It works by charismatic logic; it exploits the dialectic of leading and transforming the totality proposed in Thesis Two.

According to Weber (1978), in the case of the charismatic "[w]hat alone is important is how the individual is actually regarded by those subject to charismatic authority" (p. 242). The state of being subject to an object is the fulcrum of this particular machine. Given the pushes and pulls of causality posited in Thesis One, all subjects encountering the face[132] of the charismatic as an object are in fact subject to him or her as an object insofar as they are able to recognize[133] the non-bureaucratic[134] alterity and novelty of the charismatic's actions and self-presentation,[135] Through this kind of performance, one disrupts the mechanical, dull-round mechanisms that produce predictable and predictably unsatisfactory results. In the example of myself walking about my neighborhood under the watchful eye of the locals (see Thesis One), my wholly uncharismatic presence as an object elicits automatic, automatized responses among those subjects objectifying me. If I were instead to perform charismatically, my actions would in a sense revolutionize those subjects, making them to a greater or a lesser extent (some not at all) subject to my performance. I would literally be using the form of my person as a tool to intervene in the mindstreams of those around me, if I were competent to do it (see Introduction). And of particular interest here, this practice has a history among integral thinkers.

---

[132] The allusion here is to the existential ethics Levinas (1969) presents, a point of exploration beyond the scope of the present inquiry but well worth pursuing in this context.

[133] According to Weber, it is "recognition on the part of those subject to authority which is decisive for the validity of charisma" (p. 242). Following Ziporyn (2004), I submit that this recognition is analogous to getting a joke or being surprised by something wholly new and unexpected—recognizing the novelty of it.

[134] This is non-bureaucratic insofar as charismatic logic, pursued to its root, permits "no such thing as appointment or dismissal, no career, no promotion […] There is no hierarchy" (Weber, 1978, p. 243).

[135] "Within the sphere of its claims," Weber (1978) posits, "charismatic authority repudiates the past, and is in this sense a specifically revolutionary force" (p. 244).

Ziporyn (2004) gives four characteristics of the actions of one practicing revolutionary desire, a charismatic: *inexplicability*, *absolute confidence*, *sacrifice*, and *meaninglessness*. Krishnamurti's gesture of dissolution[136] of the Order of the Star and by extension his long career feature all four.

The charismatic act is *inexplicable*, it "makes no sense in terms of any existing context" (Ziporyn, 2004, p. 413)—as with Lotman's explosion, it cannot be predicted. The field of possible meanings of that act, therefore, are infinite; the act is suggestive of those potential meanings, but not reducible to any of them. Krishnamurti acknowledges to his followers that his action is for them utterly irreducible to any expectation they have been encouraged to hold, like the punchline to a painfully funny joke, to borrow Ziporyn's analogy:

> For eighteen years you have organized, you have looked for someone who would give a new delight to your hearts and minds, who would transform your whole life, who would give you a new understanding; for someone who would raise you to a new plane of life, who would give you a new encouragement, who would set you free—*and now look what is happening!* (p. 4, emphasis added)
>
> *Surprise*![137]

Absolute confidence, is total commitment to whatever meme the charismatic is in a given moment identifying with, but pushing hysterically "toward even more ungraspable values" (Ziporyn, 2004, p. 413). This logic reads: "What I am doing right now is, *by definition*, right, even if it means anything else I or anyone else has done is wrong" (Ziporyn, 2004, p. 414) as well as the self-reifying fool (see Thesis Four). Krishnamurti is unequivocal throughout the speech, committed "absolutely" and "without reservation" to his intended new project, and in fact he remained committed to it to the end of his lifetime.

Through *sacrifice*, which "distinguishes the charismatic revolutionary from the mere street loony or opportunist backstabber" (Ziporyn, 2004, p. 414), the charismatic demonstrates "practical indifference" to all established values, contingencies, and expectations, such as means to food, shelter, normative sexuality, filiation, affiliation, power, money, personal safety, or the law. It is, in short, complete self-exposure, total fearlessness, a merciless practice that cannot be contrived.[138] Krishnamurti acknowledges this through the report of a conversation he had had with a journalist, who regarded his decision as precisely this kind of sacrifice, asking Krishnamurti, "'What will you do afterwards, how will you live?'" (Krishnamurti, 1996, p. 3).

The new project of the charismatic must be *meaningless*, that is, "devoid of any identifiable content" (Ziporyn, 2004, p. 415), either semantically empty (means *nothing*, therefore potentially anything or everything) or hopelessly overcoded (means everything, therefore nothing specific). Finding "the uniqueness of the individual" in nonduality, which hardly obeys the logic of localized (unique) subjectivity (individual); not taking students, but insisting his listeners try to understand him (follow his reasoning) and deciding that having five committed followers would satisfy him; mistrustful of organizations but calling for a specific kind of organization, a "body"[139]—really, to state outright and earnestly that the Ultimate Answer to the Ultimate Question of life, the universe, and everything is *42* is much more unambiguously significant than the kind of qualified/unqualified creed/anticreed Krishnamurti presents. And this creative act is of real benefit insofar as it matures the assemblage of beings it was designed to reterritorialize—it may very well have been a conscious, competent act of critique, of compassion.

---

[136] I explore the possibility of integral praxis actively engaging with a form of *disintegration* in Anderson (2007).

[137] This is a creative act, a contramimetic act, and as such does not *reproduce* or mimic any set of values or forms.

[138] Simmel (2004) explores this phenomenon, the need for value to be sacrificed in order for new value to be made, in relation to money: "Sacrifice is not only the condition of specific values, but the condition of value as such" (p. 85).

In short, Krishnamurti's speech to the Order of the Star bears all four characteristics of an act produced by revolutionary desire. Inexplicably, he is a guru telling thousands of his devotees to run from gurus, with total and unwavering commitment, throwing a perfectly good career as a savior of humanity under the train of the present for the sake of a tautology, a koan, a mostly-disinterested *Verfremdungseffekt* that has proven, counterintuitively, to be very productive of insights useful to the integral project. I have suggested that Krishnamurti's example of revolutionary desire bears all four characteristics of becoming- responsible I proposed earlier. Two consequences follow from this for the practice of critique.

First, Krishnamurti's insistence on the new and the immanent over the crystallized accretions of formality, as contextualized here, demand a rigorous historicity—to produce the wholly inexplicable, one must master *what has been* explicable; to make a clean break, one must know all the bends. Second, the initial prescription for transformation Krishnamurti presents through self-recognition, a recursive recontextualization, is an opening or *first intervention* through which a radical transformational process (*second intervention*) can develop (see Thesis Four).

Revolutionary desire, then, serves the aim of producing a radically democratic regime by undermining three aspects of the affective machinery that keeps the current *undemocratic* consumer regime in place. First, it necessarily assumes within it the practice of sacrificing petty or in Marx's diction "egoistic" interests for the sake of a larger project; second, it overcodes the machinery that makes subjects *subject* to a regime rather than a self-adopted and self-directed project by becoming-incomprehensible to said regime, introducing the possibility not of a singular new form but of new forms and their production generally; and third, following from the second, it inoculates the socius against the (stupid) fear of human emancipation among the masses that Marcuse diagnoses under the current regime by making arbitrary boundaries (race and gender for instance) more and more porous and their transgression more and more normative and desirable for everyone (see Thesis Four), which frees up energy for the active work of transforming the world.[140]

---

[139] In another example of the body as a scale-invariant trope (micro-macrocosmos expressed at once), in "Sailing to Byzantium," W. B. Yeats vows to take as a future body "such a form as Grecian goldsmiths make […] To keep a drowsy Emperor awake". That sleepyheaded Sun King is none other than the "rough beast" of redemption, with the "gaze blank and pitiless as the sun," that emerges from the Spiritus Mundi in "The Second Coming"—that the beautiful, reproduced body Yeats desires to be is but an ornament to the wrong kind of meaningless recreation of values (spiritual materialism, theory in bad faith). Neither Ziporyn nor Krishnamurti advocate complicity with total annihilation, which is cognate to total irresponsibility; the body to be built is relational, contextual, and therefore predicated on compassionate engagement rather than pitiless power for its own blank-eyed sake. A point of departure for future inquiry: the "body" Krishnamurti calls for may be functionally analogous to the Deleuze-Guattarian Body without Organs (see Anderson, 2006, 2007).

The danger, as with any emergent cultural form or transformational practice, is the absorption of a *denatured* form of revolutionary desire into the commodity-regime, producing reterritorialized subjects who own mock-transformational costumes, props, and recordings of the philosopher-sage Jim Cunningham, rather than agents of change. It is true that integral practice arose historically under a series of commodity-regimes (see Thesis Three), but this does not mean that our work *must* be amenable to the desires and contingencies of the marketplace, or reinscribe the values expressed in the *terms* of that exchange—to insist on an exclusive, private-property regime (see Thesis Two) under which only those who own the means of production of values may produce and reproduce values (see Thesis Seven). Our first commitment must be to responsible transformation, an aim that may or may not coincide with the agendas of those who distribute and market memes for money, persons who may benefit from some transformations but not all. Instead, let us make concepts that are useful to everyday problems in the way kitchen tools enable the miracle of a nourishing meal in the hands of a methodical cook, in such a way that transformation can become possible, and disseminate these concepts freely *as a gift* (Lingis, 2000), as a pedagogy rather than a product.[141] *Integral Review*, the P2P Foundation, and the corner Infoshop do this already; let us learn from their efforts and support what is best in them. In short, *integral practice must remain open-source and in free circulation.*

How the transformation of a stratified totality into a radical democracy as proposed in different ways by the Budapest School (Brown, 1988), Laclau and Mouffe (2000), and Schweickart (2002), and briefly implemented by Salvador Allende and Unidad Popular in Chile, might be possible, and what role integral practice might play in that transformation, is the subject of forthcoming work.

Conclusion: Integrating the Counterproject

To read a coherence is to read two sets of histories in concert with each other. To read them integrally is, at best, a transformative dialectical process that makes real integral praxis, uncompromising creativity, possible. Rosi Braidotti (2006) frames this project as follows:

---

[140] Weber's (1978) analysis supports this speculation as well. According to Weber, charisma

> *may* effect a subjective or *internal* reorientation born out of suffering, conflicts, or enthusiasm. It may then result in a radical alteration of the central attitudes and directions of action with a completely new orientation of all attitudes toward the different problems of the 'world.' (p. 245)

Here, also, the anti-transformational arguments Hobbes makes against prophecy are relevant to an understanding of what makes a charismatic gesture transformative (see Thesis Seven).

[141] Deleuze and Guattari (1994) argue:

> If the three ages of the concept are the encyclopedia, pedagogy, and commercial professional training, only the second can safeguard us from falling from the heights of the first into the disaster of the third—an absolute disaster for thought whatever its benefits might be, of course, from the viewpoint of universal capitalism. (p. 12)

> The emphasis falls on a cognitive brand of empathy, or intense affinity: it is the capacity for compassion, which combines the power of understanding with the force to endure in sympathy with a people, all of humanity, the planet and civilization as a whole. It is an extra-personal and a trans-personal capacity, which should be driven away from any universalism and grounded instead in the radical immanence of a sense of belonging to and being accountable for a community, a people and a territory (p. 206).

Praxis is becoming-responsible, becoming-critical, becoming-compassionate. Creative recontextualization and revolutionary desire assume an intimacy with local history that is, in a sense, a relationship of uncompromising affection, the desire to be of help. *Such a body we must build*—a culture of beings conscious enough, caring enough, to do this properly rather than pathologically in a coordinated way. This coordination is what makes an integral theory indispensable to a comprehensive, transformative project. The current regime fragments the socius and the subject; the integral task is to unify, to recognize common interest and greater benefit than "going with the flow" and to strive without fail toward it. Our conscious response to current conditions must functionally integrate the points-of-articulation at which opposition to this pathological regime are positioned so that the spectrum of interests represented in what Schweickart calls "the counterproject"[142] can recognize (first intervention) they have much more in common than simple subalterity:

> The counterproject will see itself as a dialectical synthesis of the great anti-capitalist movements of the nineteenth and twentieth centuries *and* the other emancipatory movements of these centuries, especially the ongoing gender revolution, the struggle for racial equality, the fight against homophobia, the mobilizations against nuclear madness, and the efforts to halt ecological devastation. All of these struggles will be seen as part of a larger project, the counterproject, the huge, global effort to put an end to structural oppression and to ensure each and every human being a fair chance and self-realization and happiness. (pp. 5-6)

The present inquiry is intended to help make a responsible, nonviolent, and sustainable counterproject—Radical Democracy—possible.

I also hope to have made some contribution to the ongoing conversation regarding the present and future of integral theory,[143] which has, as I have shown, demonstrated an ambivalent position *vis a vis* transformative practice—in some instances oppositional, in some intentionally or unintentionally reactionary, and all three sometimes in the same book. If an integral theory is to contribute to the writ-large transformational project I have endorsed, this theoretical ambivalence must be resolved. These theses are intended to begin clarifying one approach to resolving it. There are surely others, and surely there are many points of critique available in an early project such as this one, which remains quite incomplete by the standards of many integralists; a student of Wilber or Allan Combs might object, appropriately, that I make no mention of "states" or "stages" among other important distinctions until this very moment; topics such as these are appropriate subjects for future inquiry. Finally, these theses offer some interesting consequences for integral theory's status as an independent form of intellectual inquiry, as I hope to have shown that it is possible to think integrally, to "practice integral," without reference to and outside the context of any of the currently established canons of integral thought,[144] that under some circumstances, one may get better results—more precise, more rigorous, more elegant, more effective—in this way, that critical theory is an example of such a circumstance, and that in its kernel, critical theory has always been at least latently if not explicitly integral in program if not always in practice—an unsurprising observation given the shared heritage of both in Hegel and in response to Hegel.

---

[142] LaClau and Mouffe (2000) establish this position.

[143] On August 7-109, 2008, Wilber's Integral Institute (I.I.) sponsored a conference entitled *Integral Theory in Action: Serving Self, Other, and Kosmos,* hosted by John F. Kennedy University, which offers graduate degrees in integral thinking developed and taught by I.I. members. The title of one panel at this conference, "Does Integral = Ken Wilber?," suggests that the future of integral theory and Wilber's role in it is presently an open question, the answer to which must depend in some measure on the future developments of Wilber's project.

That said, in the field of theory, there remains much, much work to be done. To that end, I would like to suggest some of the many issues that very much need to be tackled in a critical integral way: What is race? Gender? The family? The nation? Sexuality? Labor? Nature and culture? These are all *local* sites, among many others, where *global* transformation can advance an integral agenda.

For Chogyam Trungpa, Rinpoche—twenty years too late

Acknowledgment: I am grateful to the editorial team at *Integral Review* for patiently supporting this project from its inception, a process of development and transformation that has taken over a year to accomplish.

Validation of Theory:
Exploring and Reframing Popper's Worlds

Steven E. Wallis

Abstract: Popper's well-known arguments describe the need for advancing social theory through a process of falsification. Despite Popper's call, there has been little change in the academic process of theory development and testing. This paper builds on Popper's lesser-known idea of "three worlds" (physical, emotional/conceptual, and theoretical) to investigate the relationship between knowledge, theory, and action. In this paper, I explore his three worlds to identify alternative routes to support the validation of theory. I suggest there are alternative methods for validation, both between, and within, the three worlds and that a combination of validation and falsification methods may be superior to any one method. Integral thinking is also put forward to support the validation process. Rather than repeating the call for full Popperian falsification, this paper recognizes that the current level of social theorizing provides little opportunity for such falsification. Rather than sidestepping the goal of Popperian falsification, the paths suggested here may be seen as providing both validation and falsification as stepping-stones toward the goal of more effective social and organizational theory.

Key Words: Falsification, metatheory, philosophy of science, theory of theory, three worlds, validation of theory

Introduction

Within the social sciences, and more specifically within the study of organizations, numerous papers are implicitly or explicitly creating and/or promoting some form of social theory. Each indicates by its existence how relatively easy it is for someone to create and in some sense validate a social theory. However, despite the importance of advancing social theory, it remains nearly impossible to test, falsify, and improve such a theory (Popper, 2002). As a result, the efficacy of social theory and the opportunity for advancing organizational science is also limited. My interests are to understand and advance social theory, thus these are material concerns to address. My approach in this paper is to provide a model as a tool for advancing theory.

The limitations of social and organizational theory are becoming increasingly evident (e.g., Boudon, 1986; Burrell, 1997). There are even ongoing questions as to the viability of academia (Shareef, 1997). The limited effectiveness of social theory seems to have encouraged some to adopt an essentially a-theoretical approach (e.g., Shotter, 2004) that appears as an "epistemology of practice" (Schön, 1991). However a-theoretical it may seem, "practice is never theory-free" (Morgan, 1996, p. 377). I doubt such a focus on application, rather than theory, enhances the development of the social sciences. Dichotomies, unresolved, rarely enhance any endeavor over the long term because they represent a failure to integrate the dialectic.

The difference between the ease of creation and the difficulty of falsification probably explains 90% of social theory rises rapidly, only to fall again (Oberschall, 2000). This is a

SOME RIGHTS RESERVED

distressing situation for the continued validity of academia and also for the practitioners who use those theories to improve life on personal, interpersonal, and transpersonal levels. Shareef (2007) suggests we use Popperian falsification to improve our management theories. Yet, he only echoes a call that is decades old and mostly unheeded.

I suggest that Popper's falsification criterion presents a too-high hurdle, and in its present state, social theory is not strong enough to make that leap. In order to more effectively advance theory, I suggest a reframing of Popper's views, not as a means to avoid falsification, but to suggest multiple paths—each with relatively easy steps leading to the lofty summit of empirical falsification. In this paper, I explore a philosophical pathway from present forms of scholarship toward a more integral view of scholarship and its results.

To begin that exploration, I discuss the nature and structure of theory. Next, I describe and briefly discuss Popper's views on empirical falsification as well as his lesser-known views on "three worlds" (empirical truth, emotions/concepts, and theories), which are closely related to his goal of empirical validation. In that section, I discuss some weaknesses of his three worlds conception.

I propose to resolve these structural weaknesses by reframing and applying integral thinking. This reframed version of Popper's three worlds suggests a new way of validating theory, one that more easily supports the advancement of theory towards empirical falsification. Finally, I apply this framework to test a theory, suggest how theory may be advanced more effectively, and discuss limitations of this new model.

Theory and Validity

In the social sciences, there is a growing conversation around the nature, structure, and validation of theory. I provide a brief background to that conversation and suggest the multiplicity of views may be more useful than any single criterion. As prelude, I draw an analogy to two primal forces of our universe.

As we know, the force of gravity holds together our galaxy, solar system, and planet. Life without gravity would not be possible. Therefore, it is tempting to say that gravity is "the" best way to understand life. Yet, life as we know it would not be possible without atoms. And atoms are held together by the strong nuclear force (Considine, 1976, p. 1629). Understanding our universe requires an understanding of the galactic-scale force of gravity as well as the atom-scale nuclear force. Similarly, we might consider that the process of validating theory requires the understanding of multiple influences.

Sutton and Staw (1995) characterize the conversation around theory by saying, "Strong theory, in our view, delves into the underlying processes so as to understand the systemic reasons for a particular occurrence or nonoccurrence" (p. 378). Their version of theory might be summed up as possessing, "a single, or a small set of well-developed, logically linked research ideas that lend themselves readily to empirical testing" (Ofori-Dankwa & Julian, 2001, p. 415). Similarly, Weick (1989) works with Southerland's definition that a theory is, "an ordered set of assertions about a generic behavior of structure assumed to hold throughout a significantly broad range of specific instances” (p. 517). Wacker (1998) pushes for a more atomist than systemic approach, asserting that a theory has four basic criteria: conceptual definitions, domain limitations, relationship building, and predictions.

In their philosophical debate on epistemic justification, BonJour and Sosa (2003) suggested that the validation of a theory might be centered on either an internal or an external perspective. The interlinked assertions or basic criteria noted above may be understood as an internal test of the theory. In contrast, an empirical test is one that occurs on the outside of the theory.

From another external perspective, Quine (1969) suggests in his essay on ontological relativity that we may make sense of a theory from the perspective of a larger theory—or the view from society, as a whole. For example, just as one who knows a complete language is able to make sense of any sentence in that language. The sense-making arises in and applies to the larger societal context. However, in the quest for a more effective social theory, such an approach is problematic: it invites regress and irrelevance. Sense-making contracts to apply to the “nearest” context. For example, within the largest context of our shared society, the sub-context of academia seems to make sense. Nested within academia are various disciplines and publications that make sense. Nested within each of those are many theories, and each of those may also be said to make sense. However, those theories remain ineffective in practice—out in the larger society. Thus, Quine’s methods do not seem adequate to his own challenge of adjudicating among rival ontologies.

In contrast to Quine’s “outside-in” approach testing that uses the inside-out approach mentioned above might be considered a test of the logical structure of the theory – what might be called the “logos.” I am defining the logos of a theory as the structure of the logical arguments that support the theory. While the academic process may be seen as an exercise in the development of the logos, I suggest we *expand and deepen how theorists understand the structure of the logos*. Whetten (2002) appears to agree, noting how a theory may be criticized for its lack of logical internal consistency. This integral perspective goes beyond Popper’s decades-old understanding of theories that were comprised of and therefore structured by separable axioms.

Such an advance in thinking seems to parallel the development of applying an integral perspective. For example, in Wilber’s (2001) four quadrant model (where each quadrant is said to be defined or understood through the perspective of the other three), we can take the perspective of viewing the relationship among the quadrants as the internal structure of the theory. That structure must be rigorously defined, or the model will be open to criticism.

In short, for a theory to be considered effective, it must be subject to both internal and external testing. This leads us to a potential problem of regress, because in one test we are looking for empirical facts; yet, “there are no facts that are independent of our theories” (Skinner, 1985, p. 10). As a result, the empirical/applied test becomes problematic because the results of that test must be viewed through a worldview, that is, through the lens of another theory. Thus, the question: if theories guide perceptions and actions change theories, where then is there any certainty to conclusions based on perceptions?

To recognize the difficulty of testing social theory through practice is not new. Echoing reports above, some say social theories have not proven very useful for effecting social change (Appelbaum, 1970; Boudon, 1986). The success of economics as a theory was questioned long before the late 2008 meltdown (Rapoport, 1970, as cited in Dubin, 1978). In organizational studies, even though theory does inform practice (Weisbord, 1987) in some quarters, an increasing number of practitioners describe organizational theory as "irrelevant" to their work (Tsoukas & Knudsen, 2005). In such cases as these, theory is ignored in practice rather than tested through practice.

On the other side of the coin, we can imagine an excellent organizational change practitioner who, if required to employ "bad" theory, makes modifications "on the fly" consciously and/or unconsciously. Thus, a good practitioner might compensate for bad theory, further compounding the difficulty of testing theory through application. A version of this approach is implied by Weick and Sutcliffe (2001) where they advise practitioners to manage more mindfully, adopting a range of useful techniques to move away from the trap of too heavy a reliance on plans and procedures. Of course, "good" theory might be applied with bad results – as anyone can attest whose fingers have slipped while using a calculator, and subsequently generated an answer that they considered believable… but useless within a mathematics examination.

Thus, both internal and external approaches have their possibilities and limitations when it comes to determining the validity of a theory. In such a case, we would do well to understand how both approaches are necessary, or at least useful, to understand the validity of a theory, just as we do well to understand how both the gravitational force (large scale) and the nuclear forces (small scale) are needed to understand our physical universe.

In the next section, I provide some background on Popper's worldview and his approach for advancing theory. I also go into some detail describing Popper's three-world model, and how, with slight revisions to that model we can use it to advance our understanding of theory validation.

Popper: Background and Worlds

Broadly, Popper's view suggests that science is in continual revolution. There, in the pursuit of objective knowledge, science is advanced by the rigorous testing and falsification of theories, "designed to replace existing theories with more accurate theories based on empirical research outcomes" (Shareef, 2007, p. 275) and "each step brings us closer to the truth." Importantly, Popper's "concept of truth is based on the intuitive idea of truth corresponding to empirical facts" (p. 276). Necessarily, this is an iterative process beginning with inaccurate theories, and moving toward theories of greater accuracy.

Popper's version of scientific progress through the conjecture and refutation of theory has influenced a wide range of disciplines including organizational theory (Shareef, 2007). Thus, I find his ideas useful in my efforts to understand and advance social theory. Yet, despite wide understandings of Popper's call, and many decades of research, progress is clearly elusive. The tree of knowledge grows slowly and thus far is not bearing fruit. In the field of organizational studies, of many theories proposed, few have been adequately falsified. I find no well-documented advancement toward truth.

Turning attention to develop my earlier point, we have not advanced because the requirements for falsification set a standard too difficult for most scholarly investigations. Realistically, then, while falsification remains a useful goal, a series of steps toward the goal rather than a single hurdle would be more achievable for the social sciences.

Popper’s own work has the insights needed to identify those steps. He developed his “three worlds” model to resolve the mind-body problem of knowledge. Although this approach is not so well known as his call for falsifiability, I explore those three worlds and the system they create, to suggest a useful key for validating theory. In doing so, I offer a new model as a tool to advance theory more easily towards falsifiability and thus closer to effective use by practitioners.

In brief, Popper’s (1978; 1996) three worlds are as follows. World one (W1) is the physical world, consisting of physical objects, energy, and plants. World two (W2) is the mental world, consisting of feelings, thoughts, decisions, and perceptions. Popper suggests that W2 may be subdivided into the conscious and the subconscious. World three (W3) is the world of more complex conceptual constructs including stories, mathematical constructions, artistic compositions, and, importantly for this paper, theories. The contents of each world are called “objects;” so , for example, a rock would be a W1 object, a feeling of joy would be a W2 object, and a theory would be a W3 object.

These worlds can interrelate. For example, a painting (as a physical thing) would have some W1 existence (as do all physical objects). The aspect of the painting that makes it a great work of art would be a W3 object. When an individual views a great painting and experiences an emotional reaction, that reaction is a W2 object.

In developing the idea of a third world (of theory and complex constructions), Popper broke with many contemporaries and classical philosophy that suggested there was only one world or at most two (one of body, and one of mind). Popper called himself a pluralist for this reason, suggesting that all three worlds were needed to understand the mind-body problem and the situatedness of knowledge. In this, he suggests, somewhat hierarchically, that each world is founded on the one below it. W3 Theories are based on a combination of W2 ideas, and those ideas are based on perceptions of W1 objects.

Objects are subject to classification schemes. Popper discusses W1 objects (such as a block of marble), as a class of things. He also discusses W3 objects (such as a theory or symphony) as a class of things. He also notes how W3 objects, such as a plan, may be changed and altered as if they were W1 objects (one may chip away at a theory, in much the same was as one may chip away at a block of marble). While he mentions that knowledge is situated in W2, he also asserts that both W1 and W2 objects are things that might be known. Logically then, there are classes of that which might be known.

Part of Popper’s discussion in these texts involves proving the “reality” that he refers to as “truth” of these worlds, essentially seeking to validate, justify, or prove the existence of the objects within each world. He does this primarily by recognizing the importance of interaction of objects within and between worlds; for example, "observation is always observation in the light of theories" (Popper, 2002, p. 47). Thus, no W2 observation is possible without W3 theory.

Wilber (1999), perhaps accurately though much too briefly, notes one main thread of Popper's investigation; he characterizes the three worlds as relating to objective and subjective knowledge. In lumping Popper's three worlds with a variety of other concepts, Wilber misses an opportunity to use the three world concept in a way that might have proved useful in supporting the arguments he presented in *The Marriage of Sense and Soul* thus advanced integral thinking. Here, however, I use the three-world idea, but focus on science rather than soul.

For his AQAL model, Wilber suggests that each of the four quadrants exists in relation to the other three. That is to say, each quadrant may be understood only through the perspective of the other three. In a sense, if one quadrant were removed, the other three would lose their validity. This is the heart of integral thinking: recognizing and learning from interrelatedness. In contrast, Popper sees each of his three worlds as arising from the one below it. The W1 physical universe must have existed before humans evolved to perceive it (W2), and those perceptions must have preceded the sense making needed to create W3 theories.

This generation of worlds, however, is not a one-way street: "Our minds are the creators of world three; but world three in its turn not only informs our minds, but largely creates them" (Popper, 1978, p. 167). This is like the idea that "we shape our world and our world shapes us" or "our mindset affects how we see the world." Morgan (1996, p. 274) presents a similar view when he draws on theories of complexity, chaos, and autopoiesis to encourage managers to think in terms of "loops, not lines." That is to say, we should avoid thinking mechanistically (e.g., A causes B), and rather incorporate "the idea of mutual causality, which suggests that A and B may be co-defined as a consequence of belonging to the same system of circular relations." We humans frequently seek a single cause to link to a single effect. We need deeper understandings about the complete system and its multiple causes, effects, feedback loops, limits to growth and exponential growth.

In contrast to Morgan's mutual causality, the emergence of Popper's worlds one from another seems more linear. However, his discussion of those worlds goes deeper. In addition to the above description of how W3 theories may impact W2 perception and knowledge, he also described how changes in theory would enable changes in W1. This makes good sense, as a person with a plan might make more significant changes to the world than a person without one. Yet, he suggested that such changes would only occur through the intermediary of W2. In short, W3 affects W2, which affects W1. This relationship may be understood as a three-stage linear relationship.

Importantly, as Stinchcombe (1987) notes in his extensive discussion on theory, such a relationship seems to render the intermediary term (W2, in this case) redundant. We might just as well say that changes in W3 cause changes in W1. However, this would leave out Popper's very reasonable suggestion that W2 objects such as emotional reactions and insights are of a very different nature than the W1 empirical facts, and W3 theories. The three worlds are intimately interrelated while qualitatively different.

Popper saw a theory as being constructed of a set of axioms, suggesting that falsification of one axiom need not result in the falsification of another axiom. His view of axiomatic severability is troubling because the most effective theories (those that allow us to most reliably make changes or predictions in W1) are the theories of physics. Those theories are robust in the sense that each axiom is co-defined by the other axioms of the theory. For example, in Ohm's law (a theory of electronics), there are three aspects (volts, ohms, and amps). Each of those is defined by the other two. If we were to falsify volts (for example), the entire structure would collapse: there would be no way to describe amps and ohms. Thus, effective theories of physics are not amenable to axiomatic severability.

Popper pushes further in this direction suggesting that there is "no hope" of developing a useful understanding of a theory based on the relationships between the component statements because those statements (and the objects represented by them) can always be dissected to smaller pieces (Popper, 2002, p. 112). Instead, he suggests that a theorist begin with "relatively atomic statements" as long as those statements are linked to some sort of objective instrument of measurement. However, as is well known (then as now), even atoms may be split into components. In short, Popper's preference for atomistic structure of theory must be called into question. Further, as noted above, our philosophies have advanced since Popper's time, allowing for new insights into the structure of theory.

Popper can appear contradictory. "All of our actions in world one are influenced by our world two grasp of world three" (Popper, 1996, p. 142), yet, this suggests actions are a W1 object, while actions are not typically mentioned as an integral part of this theory. The act of research, as an example of an action, is mainly an implied part of the model, rather than an explicit aspect. This lack of clarity is an opportunity to improve on, or at least reframe, Popper's model.

This analysis indicates that Popper's worlds might be better understood by looking at them in a different relationship: moving from a linear view to a co-causal view of the three worlds. This approach would be a more integrated view of theory, one I expect to provide a closer coupling—a tighter integration—between worlds, and so enable a better understanding of scholarship in general, and the validity of theories, in particular. In short, I hope that by reexamining and reframing Popper's ideas, I might draw some novel conclusions that will aid in the advancement of social theory.

Reframing Relationships between Popper's Worlds

If, as noted above, the linear relationship between the three worlds is inadequate, an alternative, co-casual, model is an alternative with which to experiment. To start by iterating the observation above, each of the three worlds might be considered co-casually related to the other two. To do so would suggest that W3 theories would be determined by W2 facts and feelings and W1 reality/truth. This throws us into an immediate tailspin of regress, as we have no way of establishing that truth, outside of our feelings and theories.

In order to develop an adequate model of co-causal worlds, the content of those worlds must be reframed. An important part of Popper's equation may have been overlooked. He carefully describes how the combination of W1 truth and W3 theories will conjoin to create W2 knowledge. Yet, he seems to take for granted that such knowledge would be accepted as such. We should ask, why that truth is accepted as truth.

If the objectivity of knowledge were the only criterion, belief would not be necessary (Powell, 2001). Yet, the W2 aspect of belief does seem to be an inescapable aspect of the Popperian philosophy. The answer, which we experience on a daily basis, is that it "makes sense." That "sense of truth" would be a necessary part of the equation. Without it, how would we "sense" that one truth had any more validity than another?

We could argue that one could read two versions of theory, and simply identify that set of arguments that appears to be more valid than the other. However, that may be understood as the very definition of "sense making." After all the arguments, conversations, examples, dissections and connections, each reader must experience some feeling that the conversation makes sense in order for it to be considered correct or right.

For example, I occasionally enjoy a good trivia quiz. In those events, I have noticed in myself and observed in others that there appear to be instances where knowledge is accompanied by a sense of "rightness," even if that sense does not necessarily correspond with the version of truth held by others. While that feeling might, conceivably, be lumped into W2 with Popper's version of knowledge, such an approach interferes with our ability to differentiate between knowledge and feelings. And, for the reasons just mentioned, that distinction is an important one. In short, there are important differences between knowledge and the sense of rightness associated with that knowledge that is not related to a change in theory.

That sense of rightness seems to emerge from the intersection of theory and knowledge. When the facts fit the theory, we say that there is epistemic justification, that is, that the information seems to be true. Therefore, that sense seems to have important distinctions from what Popper would describe as knowledge even though both of them are what Popper would call W2 objects. Therefore, I recommend reframing those three worlds to separate these vital aspects.

Additionally, while there may be a world of absolute reality or truth, and our improved theories may bring us closer to that ultimate truth, I think it is safe to say that we will never fully understand that ultimate reality. Therefore, I'm not sure it makes sense to have W1 as part of the model. We would not, as an example, include the moon in a theory of continual advancement in running techniques, for no amount of running will ever reach the moon. There may be absolute truth. But if that knowledge is unobtainable, there seems to be little use to including it in a theoretical model.

For this reframing, it is more useful to understand W1 as the repository of perception and knowledge. The W2 would remain the domain of feeling and emotions, and W3 remain the domain of theory. Significantly, this distribution of worlds creates the opportunity to understand each of the three worlds in integral, co-causal relationship to one another.

For those who might object to removing Popper's version of reality, some absolute truth from this model, I would suggest designating "world-zero" as some place of absolute truth. Then too, as we are observers of this model, and we humans are also observers to our own selves (knowledge, emotion, and theories) the self or observer might be represented by a "world-infinity." Those two worlds, however, are bracketing the present conversation, and would require additional development. So, let me return to the focus of validating theory. I propose Popperian falsification may be adequately represented by the reframed relationships between three worlds. There is a W3 theory, a W2 sense of rightness, and a W1 knowledge. I think, however, that there is room for additional insight into theory validation within each of these three worlds.

Reframing Validation within Worlds

In the spirit of applying multiple perspectives, I will now shift our point of view. Instead of looking at the relationship between worlds, I will seek to clarify the situation as it exists within worlds. According to the previous discussion, a theory might be falsified by the information derived from the theory, in conjunction with the feeling of rightness accompanying the theory and the information. This other, internal, perspective might look at the truths within a world as a class unto themselves. Or, as Shareef (2007) notes, Popper recognized that within each world there were levels—essentially "degrees of truth."

For example, one might have the same theory, the same feeling of rightness; yet have a greater quantity of knowledge. Therefore, we may understand at least a quantitative level within each world. Similarly, as a new version of theory emerges, each advanced degree of truth or succeeding theory might be met with an increasing sense of rightness. These may be understood as varying levels of certainty within W2. For example, I know when I am asked a question, there are times when I have an answer… and times that I am more or less certain of that answer. As discussed above, these forms of validation might be seen as internal to the theory, rather than the external tests of validation through application and the generation of data, and the accompanying sense of rightness (or lack of same).

For example, in W1 it may be said that each object of fact has validity because it is differentiable from other objects. Also, internally to W2, it may be said that the feeling of love has some validity because it is differentiable from the feeling of hate. Moving to look at W3, it is important that Popper notes, "What is most characteristic of this kind of world 3 object is that such objects can stand in logical relationship to each other" (Popper, 1978, p. 158). In short, there is a sense of validity afforded by the categorization of objects within a world. They are also validated by the ability to differentiate objects within a world, as well as how they are related to one another within that world. Focusing on the validation of theory within W3, Popper notes the validity of mathematics (including the idea of infinity) as existing relatively independent of W1 (where no one has ever counted to infinity).

Of course, relying on internal justification alone creates the opportunity for a pitfall. Powell (2001), for example, suggests that "thick illusion" by definition, is not falsifiable. Therefore, he concludes, our uncertainty never vanishes. And so--and this is quite important—no theory is ever complete: there is always the opportunity for improvement. Exactly what constitutes "improvement" in a theory is topic for additional dialog. While Popper suggests that a more advanced theory is one that is closer to the "truth," such a claim is difficult to confirm because that truth, itself, is part of the thick illusion.

Gödel’s Proof hints at this limitation. Essentially, Gödel proved that nothing could ever be proved. Or, more formally, that no theory could be both complete and self contained. However perfect and complete the theory, there is always someone reading the theory and so formulating a new insight that goes beyond the original theory (for an interesting discussion on this topic, see Hofstadter, 1980, *Gödel, Escher, Bach*).

We might create a theory that appears to have a high level of internal consistency; yet has no basis in reality. For example, Tolkien’s “Lord of the Rings” describes a carefully constructed world (including mythic languages and fire-breathing dragons). His work has a high level of internal consistency. Despite this W3 internal strength, fire-breathing dragons remain fictional. This same theoretical limitation exists in texts of fiction, fantasy, metaphysics, and religion.

While I focus here on interrelationships within and between worlds, I do not discard the traditional need for clarity and consistency of logical arguments. Consistency is especially important. If a theory says that a dollar may be redeemed for three apples, we cannot change dollars for kiwi-fruit, or apples for diamonds, without also describing the changes in the rate of exchange. Our understanding of clarity may shift, however, under the model I am presenting. For example, we might develop, ad hoc, a three dimensional theory that includes aspects of People, Places, and “Stuff.” While the use of Stuff as an aspect of theory might, on the face of it, seem hopelessly vague, the vagueness is due to the lack of context. We might enrich that context by specifically describing the relationship between the aspects within the theory. For example, we might say that more People and more Places will result in more Stuff. Thus, Stuff might be seen as roughly analogous to “memories” (for the limited purpose of this ad-hoc example).

When co-validation is said to occur between the constituent propositions of a W3 theory, that co-validation may be repeated, fractal-like, in W1 and W2. In those other worlds, the relationship between the propositions are played out and falsified by actions and observations. For example, a theory that is essentially a metaphor might have little or no W3 validation. It would, if published, have greater W2 validation. If applied successfully to an organizational change effort, it would have greater W1 validation. At the other end of the spectrum, a theory with infinite propositions might be perfectly accurate (with high W3 validity); however, the application would be nearly impossible.

For W3 objects, which pose significant validity in one world, I suggest that the call for greater validity can be answered from within other worlds, and in the relationship between worlds. Indeed, as a theory or other W3 object advances in its internal validity, it generates a call for validation in and between the other worlds. *Broadly, a complex W3 fantasy calls for a reality check in W1 and a sensibility check in W2.* A profundity of W1 data that do not “make sense” calls for the creation of a W3 theory to weave them all together. Similarly, the level of sense between W3 objects may also be compared to suggest which one theory might seem more sensible than another.

Popper’s work suggests the best way to validate a theory is in the way it allows for predictions in W1. Thus, a theory of physics (W3), which fails to predict change in W1, will have been falsified. In the social sciences, however, the process becomes a highly complex issue of recursion. For example, changes in theory (W3) will cause changes in productivity (W1) but may also alter individual sense of importance (W2), so that an individual may no longer place the same value on the items being produced. For example, individuals working on an assembly line might (based on an emerging mindset) change their minds and decide that the human producer is more important than the objects on the conveyor belt.

Driven by a modern rather than integral mindset, Popper may have pushed too far in pursuit of his deductive agenda, a “Kantian epistemological activism” to the point where “we attempt to impose our interpretations onto the world rather than being passively instructed by it” (Shearmur, 2005, p. 265). Although Popper concludes that measurable W1 results represent the highest level of validation, because W1 represents empirical outcomes, both the process and the content of his conversation on the relationships within and between worlds suggests that the door is still ajar for alternative forms of validation.

For example, by way of recursion, Popper’s arguments in favor of falsifiability can themselves be understood as a form of theory. As a set of logical arguments that are not backed up by empirical data, Popper’s argument does not stand up to his own test. It does, however, retain validity in this reframing of his worlds where his theory may be understood as an advanced W3 object. By reframing his model from a linear/mechanistic one to an integral/co-casual form, I am advancing that model to a higher W3 standing. However, that higher W3 standing also heightens the imbalance between worlds, resulting in a call for W1 validation.

Thus, no one world, or relationship between worlds, should serve as the single criterion for the validity of theory. Instead, a theory should be understood as increasingly valid as it increases in validity within and between all three worlds. Because my focus here is on the validation of theory, I discuss validation within W3 in the next section. Following that section, I apply these concepts in an analysis of a theory.

Validation within World Three

If a theory, as a set of related propositions, claims validity through logical arguments, it is legitimate, even necessary, to ask whether those arguments are essentially part of the theory, or are they part of the justification of the theory. If it is the latter, the logical arguments used to justify a theory are themselves objects of W3. This means they also must be legitimized in the same way. This creates an issue of recursion that may severely undermine attempts to validate theory through logical arguments. In the past, such an issue has been resolved by resorting to axioms. For example, Steiner (1988) describes the system of a theory, at least in part, as being constructed as a chain of definitions. Frustratingly, her conclusion was that the last link of a chain remains undefined. Her assertion seems atomistic and unusable. As I have developed elsewhere (Wallis, 2006, 2008a) the idea of a theory constructed of co-defining propositions provides a robust alternative to axiomatic terms.

Legitimacy exists for two reasons: (a) there is a co-causal relationship *between* worlds, and (b) there is a co-causal relationship *within each* world. If greater validity is derived from greater agreement (e.g., the consensus of expert opinion is more valid than the opinion of a single expert), that line of reasoning can extend to positing that *more aspects* of validity should be seen as *conferring greater* validity. That is, a combination of validating relationships (including W1, W2, and W3) confers greater validity than any single one. An object in any world has greater legitimacy when it is validated from more "directions:" (a) qualitatively, within worlds and between worlds, and (b) quantitatively, more relationships are better, whether they are inter-world validations or inner-world validations.

As the issues I am addressing indicate, the conversation on the validation of theory based on its structure has been mired in Western-traditional understandings of logic and rhetoric. For example, Steiner's (1988) work is a framework for theory justification based on the construction of language and logic. In a logical argument, the W3 object of theory is constructed of a chain of other arguments that ultimately must rest on observation. While the components of the theory may, or may not (depending on their complexity), be considered as W3 objects, the observations are certainly W2 objects. Hence, many arguments of logic are essentially validations between worlds. Because individual understanding of the world (W2 objects) is dependent on individual theories (W3 objects) the issue of regression, as demonstrated above, is inherent even in simple observation. Or, more briefly, "Truth itself is plainly useless as a criterion for the acceptance of a theory" (Kaplan, 1964, p. 312).

In contrast, Dubin's (1978) work went beyond the traditional calls for rational argument by suggesting that higher validity could be obtained by higher orders of structure of the theory. While this appears to be looking within the W3 object, it is more useful to say validity results from comparing the components of the theory, *where those components are of sufficient complexity to stand on their own as W3 objects.*

For example, a theory that is essentially a list of facts would not be much of a theory. Indeed, decomposing any body of theory to a list of bullet points would essentially remove the structure from its W3 standing. In short, to achieve the opportunity for W3 validation, a theory must be of sufficient complexity that each of its component propositions must also qualify as W3 objects. In a sense, such a reduction is like atomizing or de-integrating the construct from W3 to W1 status.

Recently, I developed Reflexive Dimensional Analysis, a method for analyzing a body of theory (Wallis, 2006). Later, I clarified the importance of "internal justification" of a theory (Wallis, 2008a). For an example of an internally validated theory, I return to Ohm, and his I=E/R where each aspect (volts, amps, and ohms) is defined by the other two aspects (Considine, 1976, p. 1678). The internal justification view I introduced considers theories of greater internal validity to be more "robust" and, as illustrated by the robustness of Ohm's law, more robust theories stand much stronger chances of enabling—and eventually predicting—W1 changes.

Although some might say Ohm's law is a relic of modernist or deterministic thinking, from another perspective, Ohm's law *is only deterministic if* two of the three aspects are known. For example, in order to determine the volts in an electrical circuit, both the ohms and the amps must be known. If, in attempting to determine the voltage of a circuit, the investigator is aware of only one aspect (e.g., the amps), the other two become *indeterminate*. In that case, the model, even when indeterminate, may serve as a signpost suggesting directions for further investigation. Thus, the model simultaneously provides deterministic boundaries (based on the limitations of the model) and also provides indeterminate opportunities for exploration. The context and extent of determinants account for a model's simultaneous possibilities.

Where Nonaka (2005) suggests the group creates and validates knowledge, in the same way, both individuals and groups must use theories in the process of validating knowledge. Where Nonaka discusses the idea of “ba,” which includes “contexts and meanings that are shared and created through interactions” (p. 380), I seek to differentiate contexts and meanings in a straightforward process with methods for theorists and change agents to evaluate theory through multiple perspectives. Those intersubjective methods of measurement may be developed across and within Popperian worlds to objectively identify the epistemological validity of theories.

If theories can be created and confirmed to have a high degree of validity, we should expect those theories to be more helpful for processing information individuals encounter in their daily lives. In short, when theories are more useful, individuals may develop themselves more effectively.

In some sense, delving into a turn of the regression, we can conceive the inside view of one model to be the outside view of another. That is to say, an outside view of validation of theory involves a comparison of three worlds (theory, fact, and feeling of rightness). As we move into the inside view of theory, to validate a theory from the inside, we are now adopting a new perspective. What were previously seen as W3 theories, have now become W1 facts. The W3 theory place is now held by the method of metatheoretical analysis being developed here. However, that is all a matter for a future paper. In the next section, I apply the above ideas to the analysis of a theory.

An Analysis of Theory

To support my belief that the ideas presented here have useful implications, I apply them in analyzing others’ work. If validity of theory may be understood within and between worlds, each scholarly study should include reflections on how the new theory fits within and between worlds. Such an effort need not be extensive, once the ideas are generally understood. Such a review would include observations, logical arguments, and some reflection on the authors’ sense of rightness. To some extent, many scholars aim toward such goals on a regular basis. In this section, I present and apply a framework for using this analysis to show how it might be done.

This framework for the analysis of theory operates as a coherent checklist. Its benefit is the clear indication of validation within and/or between worlds. The analytical results can be shown in a matrix of the checklist’s dimensions of validity (Table 1). Such a presentation of an analysis

Table 1. Dimensions of Validity

	Level 1	**Level 2**	**Level 3**
World One (Facts or data)	Uses objective data.	Uses objective data from multiple sources.	Future facts are predicted.
World Two (Meaning, emotions)	Makes sense to author.	Makes sense to editor, reviewers, and readers.	Consensus of expert opinion (this theory is preferred over other theoretical options).
World Three (Theory)	Includes logical arguments.	Theory is constructed of specific propositions.	Theory is constructed of co-causal propositions.

enables theories to "recommend themselves" to managers and other organizational change agents in search for a strong, appropriate theory to apply. While this is more a test of existing theory, it also indicates areas to focus on for future advancement of the theory.

For this demonstration analysis, I pulled (more or less at random) an article from my files, and now analyze its contents using the reframed three worlds perspective. The article is *Institutional entrepreneurship in mature fields: The big five accounting firms* (Greenwood & Suddaby, 2006). The study combines multiple theoretical bases to identify dynamics of change in organizations. Essentially, the focus is on institutional theory, which considers organizational change (and stability) as well as how the organization affects individuals, their mental states and their interactions. Briefly, the big five accounting firms became so large and powerful that they were no longer subject to the norms of their industry. They became more open to alternative ideas, such as the creative accounting processes of Enron. The analysis shed light on the dynamics leading to the collapse of Enron and Arthur Andersen.

World one considers the facts, or the data of the study. In this case, the authors interviewed senior partners at top accounting firms. They also drew on archival data such as annual reports, audit statistics, training records, press releases, and transcripts from hearings. As such, there was a large quantity of what might be considered facts, in the Popperian sense. The figures showed that the big five did indeed hold the lion's share of the market – nearly 80%. Based on their analysis, the authors went so far as to predict that the evolution of the field's elite will outstrip regulatory efforts." Based on these results, their study has a high level of W1 data. Their data are objective, from multiple sources, and includes their prediction of future events (another form of data).

In contrast to the world of facts, world two is focused on meaning and emotions. In this world we may assume that the paper makes sense to the authors, or they would not have written it. Additionally, in their "appreciations," the authors note the contributions of research funding, numerous collaborators, and anonymous pre-publication reviewers. This explication raises the level of W2 validity because it indicates that more scholars believe the paper has merit. Finally, the paper earned the authors the Academy of Management Journal "best paper" award for 2006. The external professional recognition indicates the paper has a still higher level of meaning for experts in that field. It is too early to determine if the paper will have much effect outside of academia; if so, that would indicate another level of meaning.

While we may assume that the authors' writing process included a great deal of reflection (an important part of making meaning), one defect here is that the authors do not explicitly surface their own reflective process in the paper itself. Explicating their making-meaning process transparently would add to the W2 validity of the paper. In an interesting negative example, the authors credit a specific individual with cutting a "Gordian knot." This analysis would have more data if the authors had discussed the knot and the process that led to its removal.

In world three, the theory of the article contains many logical statements. I do not spot any "contradictory axioms" that could be used by the authors to draw any conclusion they desired (as might be found in metaphysical texts) (Popper, 2002, p. 71).

The authors describe their theoretical orientation, and as a result of their research, suggest a process model and a set of seven propositions to explain the phenomena under investigation. Interestingly, their process model suggests two views of the process. The first view shows a coarse-grained analysis of the interrelationships between relevant theories, the second a fine-grained analysis that shows the causal relationships between the various aspects of those theories.

Propositional analysis is a useful tool for analyzing the relationships between co-causal aspects of a theory (Wallis, 2008a). Essentially, propositional analysis involves identifying the total number of aspects (or concepts) within a theory and, within that number, identifying those aspects that are "concatenated." A concatenated aspect is one that is influenced, caused, or understood by two or more other aspects (Van de Ven, 2007). For example, in a proposition where A & B together cause C, C may be understood as a concatenated aspect, while A and B are not (being purely causal). By dividing the concatenated aspects by the total number of aspects, a ratio is derived that describes the robustness of the model.

Robustness, then, is measured on a scale of zero to one, with zero indicating no robustness (as might be found in a shopping list of concepts), while a robustness of one may be found in a very effective theory of physics (such as Ohm's law). Further, robustness is a measure of the internal integrity, or integrality, of a theory and, as posited above, is a useful predictor of that theory's efficacy in practice.

Although space does not allow for a complete exposition of analysis using my model, a propositional analysis of Greenwood & Suddaby's coarse-grained model finds a robustness of 0.29 (the result of two concatenated aspects divided by seven total aspects). Their fine-grained view has a robustness of 0.31 (the result of five concatenated aspects divided by 16 total aspects). These levels of robustness, while not very impressive compared to Ohm's law, are not uncommon for social theory. For example, institutional theory has a robustness of 0.31 (Wallis, 2008b).

Moving outside of the individual worlds, and into the relationship between worlds, additional insights and important contradictions begin to emerge. For example, the authors' prediction about the field's elite evolving faster than regulatory changes. Such a relationship would be considered observable data, yet those data are not accounted for in the theoretical model the authors propose. This misalignment between the world of data and the world of theory suggests the need for additional (and more careful) work in developing their model. In short, each of the three worlds is an admirable exemplar of academic work. However, these three worlds are not necessarily part of the same solar system.

The analysis presented in this section may also be understood as a piece of W1 evidence, relating to the W3 theory presented in this paper. Of course, as discussed above, those two worlds are insufficient by themselves. I must also *apply* my model *to my use of* the model, another recursion to examine validity. To form a more integral model, then, there must be an accompanying W2 feeling of validity. The same levels of analysis pattern I used on Greenwood and Suddaby is the pattern I now use on this work I am writing that you are reading. On one level, there is some feeling of rightness on my part, although I certainly feel that I need to do continued investigation and explication of my theorizing. I assume there is an implicit sense of rightness on the part of the reviewers and the editors, else this article would not be published here. A more important level of W2 validity is the feeling of rightness that may be felt by you, the reader.

Table 2. Dimensions of Validity for Greenwood & Suddaby

	Level 1	Level 2	Level 3
World One (Facts or data)	Uses objective data.	Uses objective data from multiple sources.	Future facts are predicted. However, data predicted do not match source data.
World Two (Meaning, emotions)	Makes sense to authors. Authors should explicitly surface reflections.	Makes sense to editor, reviewers, and readers. Authors recognized by peers.	Does not have consensus of expert opinion. Model is not compared with other models.
World Three (Theory)	Includes logical arguments.	Theory is constructed of specific propositions.	Theory has co-causal propositions to 0.3 level of robustness. Room for improvement by increasing robustness.

Limitations of the Proposed Model

My approach to validation of theory does have limitations. For example, if we wanted to analyze a complex structure such as a high-rise office building containing multiple organizations, the difficulty of listing each item, to say nothing of categorizing each of those items into its sub-aspects of each of the three worlds would be intimidating, to say the least. Perhaps the most effective use of my model is in metatheoretical analysis. There, for example, the scholar may review his or her own work, or the work of another scholar, and readers could easily identify the strengths and weaknesses of articles they reflect on and make useful suggestions for improvement.

Reflecting on the above analyses, and the levels of validity noted in Table 1, indicate another area for possible improvement of this model. The W2 levels of sense-making starts with the article making sense to the author. Then, at progressively higher levels, it essentially asks if the paper makes sense to editors, reviewers, and other experts. The usefulness of this scale may be called into question because any article that is subject to this evaluation will have already passed the first and second levels. Few will ever reach the third. Some reframing of this scale may be useful. Similarly, most or all papers will easily reach the W3 level of including specific, logical propositions, while few will ever reach a level of high robustness of their co-casual propositions.

One alternative might be to revise the scale into something more quantitative. A metatheoretician might, for example, count the total number of facts, the number of propositions, and the number of people who agree with the model. This would provide specific and objective data for comparing and contrasting theories.

The generally high levels of efficacy found within worlds for the analysis of the Greenwood and Suddaby paper may be expected for an article of their high academic caliber. This, in turn, may suggest that the form of analysis I presented represents an evaluation based on traditional academic and/or Western values. More reflection and analysis should reveal more insight into this concern. I, for one, would be interested in seeing alternative evaluation methods, and an argument might be made for non-evaluation (although such an argument would be an evaluation).

Future studies might include an investigation into the measurement of each world's objects and how they are seen and measured from the combination of other worlds. Another opportunity is to identify a "triple helix" of iterative interactions between the three worlds. Nonaka (2005) suggests a spiral relationship in the knowledge creation process, resulting in the generation of more knowledge and knowledge that is more useful. If this process is replicated for W1 and W3, we might imagine three spirals, with interesting opportunities for measurement and insight. Looking within each world, there is the possibility to "unfold" each world into additional dimensions to identify the quantitative and qualitative nature of each world object. The opportunity also exists for a similar quantification of objects that exist simultaneously in all three worlds.

Another form of validation might be seen in the process of creation. For example, the social construction perspective suggests that knowledge and social norms are both created through the general process of social interaction (Burr, 1995), that a socially constructed culture strongly determines how each individual sees the world, and finally, that knowledge and social action are linked. Social construction might be seen as analogous to the process of theory creation, where the theory is a cultural frame of reference, and that frame of reference is continually changed by its interaction with other theory, application, and conversation.

Both processes (social construction and theory construction) seem to be recursive in that they are continually repeated processes; the theory changes the way individuals see and gather information, the information changes the theory. In short, within the process of communication, theory may be understood as being created by knowledge and that the process of using theory generates knowledge. It seems this reframed view might dovetail with a social constructionist point of view. However, more study would be required to develop this idea.

The relationship between worlds presented in this paper could be tested through a longitudinal study that tracks the knowledge, theories, and effectiveness of an organization over time. The resulting information could suggest, for example, the amount of effort that should be allocated between action, knowledge creation, and theory creation within the environment of a particular industry. Such knowledge would contribute the effectiveness of translative and transformative development.

For example, one could analyze economic theory used at the state and national level, including the robustness of those theories. Those results might be compared (over time) with level of consumer confidence and the number of people living above the poverty line. Similarly, one could study the theories and policies used by corporations and community groups. The results of those studies could be compared with organizational success and/or organizational adaptability.

Here, I have focused on W3. Future research might focus on other worlds. One big question might be an investigation into spirituality. If spirituality is associated with and evidenced through a spiritual awakening, and that awakening is reflected in a sense of wonderment, that sense might be understood as a W2 object. As such, there may be internal analyses that seek to analyze the quantity and quality of such moments of amazement. More interestingly, however, we could investigate how that W2 feeling might be understood in co-causal relationships with W1 evidence and W3 theory.

While Table 1 offers a matrix-checklist approach for investigating the validity of theory, it could be expanded by identifying a scale within each box. For example, if a theorist is seeking validation on a W1 dimension at Level 1, he or she could (and should) note how many situations have shown improvement from the application of the theory. As noted above, there is no specific progression between worlds. While W2 validation may move from individual opinion to consensus of opinion, that consensus does not guarantee increasing validity in W1 or W3.

Perhaps neither knowledge nor theory can be fully understood or validated except in relation to the other. If so, the primacy of that relationship suggests all the following are worthy of significant exploration: (a) the processes of theory creation, (b) the structure of theory, and (c) especially the relationship between action, knowledge and theory.

Conclusion

Popper (1996, p. 4) is mainly interested in the growth of objective knowledge. This direction is in keeping with his call for empirical validation of social theory. However, in his discussion of the three worlds, he is highly focused on developing the W3 perspective of theory. In that focus, he may have missed some interesting insights. Significantly, he was a product of the modern age. That milieu is reflected in the linear structure of his three worlds model. His view of theory may have opened the door for the explosion of theory in the social sciences without necessarily advancing any specific theory. This is because he saw a theory as being comprised of and constructed by a set of axioms. He thought falsification of one axiom need not result in the falsification of another axiom. This view may have provided philosophical ammunition to scholars, emboldening them to revise theories by changing their axioms, almost at random. It seems strange to me that this approach would actually be acceptable to Popper (Popper, 2002, p. 113).

While, on the surface, this may seem a perfectly reasonable approach to some, demands for rigor should prevent such a disconnection within the bounds of a single theory. After all, if a theory is composed of two axioms, and one is falsified, the theory would no longer be a theory: it would be a single axiom. An alternative would be to replace the falsified axiom with a new one. However, in this example, that means half of the theory has been changed. Can we reasonably call that theory by the same name? I don’t think so. For a deeper discussion on the problems of changing theory, and the measurement of that change, see my discussion on “dynamic robustness” (Wallis, 2008b).

My thesis is that instead of holding ourselves to the nearly impossible standard of using empirical validation to create higher quality theory, we of the social sciences instead have been building and amassing higher quantity of theories. Drawing on and reframing Popper's idea of three worlds, I proposed a co-causal version of the three worlds model. I presented a range of possibilities for the validation of social theory including methods within and between worlds. Additionally, I presented a checklist style matrix for the easy validation of theory. Essentially, this matrix indicates that theories might be validated more effectively from the inside and the outside rather than one or the other. Finally, I tested that matrix in an analysis of a theory. In this, I have identified an important way to advance an otherwise admirable paper (i.e., Greenwood & Suddaby).

Because our theories shape the way we work in the world, the opportunity to purposefully advance a theory is also the opportunity to indirectly impel social adaptation and evolution. In short, by advancing our theories, we advance humanity and more.

Despite the apparent failure of the social sciences, there is progress toward success. The shared understanding of metatheory is advancing. For example, in addition to many other valuable insights, Whetten (2002) and Van de Ven (2007) both provide useful metatheoretical exercises for students. This is a significant improvement over the previous approaches to understanding theory because the ability now exists to engage in useful classroom exercises on theory creation where previously, that ability was tacit or non-existent. Such a capacity suggests that the understanding of theory has advanced to a particular level. On the other hand, this might also indicate that the opportunity exists for theorists to step back and not be so concerned as to whether a theory is good or bad, and simply note that the mass of theories that have been developed over the past century may now be described as data for metatheoretical studies.

When climbing a technically challenging mountain, such as Everest, the expedition establishes a "base camp" where supplies are easily stockpiled. At a convenient location, higher up the mountain, it establishes an "advanced camp" where climbers recuperate and get additional supplies ferried up from the base camp. Should the first attempt to reach the summit be unsuccessful, the next attempts launch from the advanced camp. Thus, a well-organized expedition does not lose valuable time and energy going back to the foot of the mountain to re-supply and re-energize: a more efficient way to make repeated attempts until the summit is reached.

In that spirit, I hope the model I present in this paper indicates how we can establish a conceptual camp for advancing theories. At such a camp, an evolving theory might gain energy from validation within worlds and falsification between worlds, on its way to the summit of empirical falsification. In short, I anticipate that increasing our capacity to understand theory will lead to improvements in theory, and so inform developments in practice for the benefit of many across many domains of life.

Integral Evolution: An Interview with David Loye

Russ Volckmann

David Loye is one of those people that the longer you get to know them the more you begin to discover a bit of their depth and breadth of perspective and creativity in the world. His publications speak for themselves. His network with leading scientists and thinkers around the world is equally impressive.

Actually, my first contact was with David's wife, Riane Eisler, author of the Chalice and the Blade (among other books written with and without David). Despite the fact that they live over the hill from me, I did not meet her face to face right away. Rather, I interviewed her over the telephone for the Integral Leadership Review, which I publish and edit. When I first approached her about doing the interview she suggested that I should interview David, but I did not know David Loye's work at all. In that interview I discovered more about Riane's work and the extent of their partnership. In fact, they are prime movers of a partnership approach to leadership that they promote through a nonprofit center and in a Master's program at the California Institute of Integral Studies in San Francisco.

My conversation with Riane piqued my curiosity about David's work and I bought one of his books, Darwin's Lost Theory of Love. Here I found evidence of the extraordinary scope and depth of David's work that made him a natural candidate for an interview. The only question was would I use it in Integral Leadership Review or in Integral Review: such is the quality of his interests and intellect.

Before doing the interview, I borrowed a copy of one of David's earlier books. When I went to their house to pick it up I met them both. They are quite a team and I recommend their work to all.

—Russ Volckmann

Russ: *David, welcome to* Integral Review.

David: Thank you for having me.

Russ: *I know you have a background in psychology. I'd like to hear a little bit about the nature of your background and then explore where you've gone from there.*

David: Well, I started by going to the New School for Social Research during the evenings and got my masters and finally my doctorate. Then I had a brief time at Princeton as a visiting lecturer, after which I went on to UCLA School of Medicine as a research psychologist in the Neuropsychiatric Institute. I have a doctorate in Social Psychology, but my master's was in pre-clinical. That's roughly my background. I wound up primarily as a research psychologist.

SOME RIGHTS RESERVED

Russ: *And during what years did you do your degree at the New School?*

David: Oh, gosh, that was back in the Stone Age.

(laughter)

David: It must have been in the fifties.

Russ: *That preceded a lot of the work that was being done around more humanistic approaches to psychology.*

David: Yes, my grounding was primarily in Freud and Jung, but most importantly Lewinian Field Theory.

Russ: *Kurt Lewin's work.*

David: Yes. Kurt Lewin's work was the most formative thing for me. His work underlies not only social psychology but leadership training, as well.

Russ: *In what ways was his work influential on you?*

David: He was the first really true systems psychologist. There is no other psychology to match it. That's the reason it's been so influential. It wasn't hooked into just Gestalt or Freud or anything. It was a fluid, highly visual-oriented psychology that could be applied to all kinds of social, political and economic problems, problems in marriage and so on. He was a great innovator in action research, which has always been my passion.

Russ: *That underlies the field of organization development where I spent 22 years of my life, and apparently it related to work that you did as well. In what way were you involved in action research?*

David: My early work was in the study of right/left, liberal/conservative differences. I did a lot of experiments. One of my basic books in that area is called *The Leadership Passion: The Psychology of Ideology*. That was very definitely action-oriented. Ever since, practically everything I've written, I've wound up laying the groundwork for whatever the area was that I was looking at by pulling together what attracted me to the works of others. Ever since, I've always written a closing chapter or appendices or something that applies it directly, as Lewin did, to solving all kinds of social and economic and political problems.

Russ: *So this was an interest of yours as far back as the fifties.*

David: Oh sure. My first book actually was *The Healing of a Nation*. It was heavily action-oriented. It won top national awards and including one that earlier had been won by Gunner Myrdal for research on racism and how to eliminate it. It was the Anisfield-Wolfe award.

Russ: *What was the thesis of* The Healing of a Nation*?*

David: *The Healing of a Nation* didn't come out until 1971, at the climatic years for the whole civil rights push. It preceded the anti-war movement that came along later. It was the heyday for doing something about race.

Russ: *My senior paper in college in the early 1960s was about the impact of Gandhi's philosophy of Satyagraha on the civil rights movement in the U.S. We have some commonality there. And what would you say were the major theses or suggestion to come out of your book?*

David: I dedicated the book to Kurt Lewin and to the great black sociologist W.E.B. DuBois. I did two things in it. One, I took the perspectives of DuBois and Lewin and suggested what in terms of their work could make a difference in ending racism in America. The significance of that book within my total output from then on was in the title, *The Healing of a Nation*. The perspective is that we are a sick nation. We must take a social-psychiatric perspective on the healing of the nation. In it, I wrote my first "Program for a President" in which I took Lewin's work and fitted it in with my previous experience with television of how to actually fairly quickly move us ahead on the whole thing of racial differences.

Russ: *As we're both aware in the current political campaign, the whole issue of racism has been brought to the forefront once again. What were your recommendations and how have you seen them play out?*

David: My recommendations were primarily to launch what amounts to an electronic version of what became known as the Town Hall meeting, which was also hot back then. In politics it was later brought up by Ross Perot, but he didn't do much with it. Actually, no one has done much with it. Howard Dean picked up on part of the idea by launching the first really sophisticated use of the Internet, which Obama,, of course has perfected beautifully. That is the approach I was suggesting back in the early days of television.

Russ: *Of course John McCain has advocated the use of Town Hall meetings in the presidential campaign—*

David: Yes, but his Town Hall is just the old style. He's not using the power of technology and communication to link a whole nation together.

Russ: *Your recommendation preceded even the extraordinary communication capability of the Internet today.*

David: I had never thought of it that way. That's true. Oddly enough, back in that time, I sent the book to then-Vice President Mondale and he actually read it, which seldom happens when you send books to well-known figures. He wrote back that it was an interesting idea for that time, but politically unfeasible. And he was right. I later heard from Lyndon

Johnson, after he was president. He had read the book. I had complimented Johnson for everything he was doing to advance the racial picture and he was very grateful.

Russ: *How wonderful! What intrigues me about this early work is not only did you have an interest in action research methods and social psychology, which is already a field that bridges multiple disciplines from an academic point of view, but it also sounds like you were interested in politics and sociology and a variety of the social sciences. Is that accurate?*

David: Yes, that's why I finally found a home in systems science. But then in my own estimation, I went beyond what we think of as traditional systems science, which is fundamentally rather static. In other words, it's a reading of a problem from the perspective of all sciences—natural and social—and that's its great strength. It takes what is now fragmented and tries to put it all together in a total perspective. But what really liberated and excited me was to move on into what I'm now trying to define in my writing as evolutionary systems science where in addition to having the perspective of all the natural and social sciences, we bring that perspective to focus on a problem. We are seeing the problem in terms of past, present and future. We are seeing this movement from where it began, where it is currently and where it's going. This was very Lewinian-oriented and is to me the great excitement of the whole field is evolutionary systems science, which I got involved in with the General Evolution Research Group.

Russ: *It sounds like you were part of a larger movement that involved people from multiple disciplines in looking at evolution and its implications.*

David: Back in the days when Chaos Theory was just getting off the ground, it became the great strange attractor that pulled a number of us together. I wound up out at a secret meeting in Budapest. Ervin Laszlo, who went on to become maybe one of the best systems scientists in the world, had this vision of moving beyond the old Darwinian survival of the fittest-type theory and using chaos theory to move from chaos to order. So we met secretly in Budapest—scientists from behind the Iron Curtain and from the U.S. and Western Europe.

In the early days our General Evolution Research Group included people like Francisco Varela, Ralph Abraham and a number of well-known people in Hungary and Finland. Then later on Karl Pribram became a member. Riane Eisler was there with me, originally, and became a co-founder of the group. That was one of the most exciting and formative influential periods in my life, because I was able to work with top notch people in different fields: biology, psychology, sociology, political science, history and management science—there was a heavy orientation towards management science.

Russ: *As well as physics and biology it sounds like.*

David: Yes, absolutely. There's nothing like the subtle influence of all these different perspectives. You're hit with papers by these various people and you can't ignore all of them.

(laughter)

David: You're forced to read enough that your own mind's understanding begins to expand. Then, of course, in talking to them you're forced to be able to refer to Lovelock with knowledge. Prigogine was an honorary member of the group. You're also forced to read their works in order to converse with your associates in an intellectual way. It was a wonderful learning experience.

Russ: *In recent years, Basarab Nicolescu initiated an international movement. He is a Romanian physicist based in Paris. The movement is about what he calls "transdisciplinarity," and he and some colleagues wrote a manifesto about this. They are trying to promote the spread of transdisciplinary educational programs in universities around the world. He makes a distinction between interdisciplinary, multidisciplinarity and transdisciplinary. Interdisciplinary is essentially where people come and talk about a problem from each of their points of view. A multidisciplinary approach would be where you have multiple disciplines doing this, but a transdisciplinary approach is one where you in effect transcend the perspective of any one discipline and come up with a higher level perspective of the issue you're addressing.*

Does that sound like your work?

David: Yes, and it also sounds like the orientation of the leaders of what became evolutionary systems science from the beginning. They didn't call it transdisciplinary, but that's where they wound up. The great ones of the field literally transcended the disciplines and came up with the larger perspective. Maslow tended to do that within psychology and helped to launch humanistic psychology.

Russ: *Is that where you gained your interest in evolutionary theory and the work of Darwin?*

David: Yes, because the way I discovered the theory of Darwin was…well, I was learning all this fresh stuff about evolution that I had not known before. Back then, when discussing evolutionary theory, I would just routinely pop in a few references to some secondary source on Darwin. The deeper I got into it, however, I kept thinking, "Well here are these people who are damning Darwin for this 'survival of the fittest' stuff, and now selfish genes—the later generation of so-called 'Darwinians'—and are coming out with this highly selfishness-oriented 'survival of the fittest' theory." I thought, "What did Darwin really say?"

I discovered to my astonishment that the bulk of the people working in the field of evolution had only read Darwin from secondary sources. They were simply aping what they were told beginning early in the 20th century was Darwin. But the neo-Darwinians took Darwin and reduced him. It was a neo-Darwinian reduction that took hold of science and also strengthened that whole disastrous "survival of the fittest" orientation in society, particularly in politics and economics, with this diminished picture of Darwin. I discovered that what Darwin was actually saying is that it's natural selection and variation—he didn't say "random variation"—working and he apologized for using the phrase "survival of the fittest" which he got from Wallace.

Russ: *Essentially at that point in his work, he was talking about sub-human species, was he not?*

David: Yes, primarily he was talking about what set the whole thing in motion prior to human development. In the opening of the *Descent of Man* he tells us he's now moving on to look at human evolution. What happens at our level?

What they ignored is that in *Descent of Man* he writes only twice about survival of the fittest and apologizes once for using the phrase. But he writes 95 times about love and 92 times about moral sensitivity. What he is saying is that at the human level, the prime drivers are moral sensitivity. I dug further into it and discovered that not only did he flesh out a later theory of exactly how moral evolution developed stage by stage, but that was all ignored. I've never seen it tracked in the way Darwin intended except in my own work. It was just astounding.

Russ: *So in his later work, Darwin is saying that evolution is more than just about biology; it is also about psychology. Is that a fair statement?*

David: That's part of it. In his later years, it was psychology that primarily fascinated him.

Russ: *And it's from the psychology that we relate the moral and ethical development of human beings.*

David: Only in part. The great strength of Darwin is he articulates the whole growth and development rooted first in biology. He points out in *Origin of Species* that there are two ways that evolution happens. Organisms either developed by killing one another or by cooperating and working together. In the later book, as well as his early notebooks, he developed the idea of the development of the moral sense out of biology, which we now know as his definition of certain stages. It starts with the first appearance of sexual instincts, then parental instincts, then social instincts over millions of years at the mammalian stage. It then moves on to the evolution of emotion and reasoning, which evolved in higher mammals and humans. He roots it in the whole movement—biology in cultural evolution includes psychology as a field that could begin to understand what was going on more intimately.

Russ: *Then it would be fair to say that the evolutionary perspective, including that of moral development, involves a biology, the conscious and unconscious aspects of psychology, as well as the life conditions that people are engaged with in terms of social evolution, is that correct?*

David: Yes, yes! One of the stock phrases today in the social and natural sciences is the idea of self-organizing processes. This was Prigogine; this was Varela and Maturana and a good friend of mine, Vilmos Csanyi, who's a leading Hungarian biologist. The emphasis on self-organizing processes was in Darwin originally and ignored. He emphasized repeatedly that the organism has this capacity for choice. It isn't simply that the organism is shaped by external forces like natural selection. This process outside the organism selects out of variation in what it's going to allow to prevail. But he also is emphasizing that the organism selects its own destiny out of the platter offered to the organism. This was totally ignored, literally, by everyone I know. That's one of the things I really bear down on in my work.

Russ: *You've written quite a bit about this. The book I'm most familiar with is* Darwin's Lost Theory of Love. *You've also published other works such as* Darwin's Lost Theory, Darwin in Love *and more recently* Bankrolling Evolution *and* Measuring Evolution. *So this whole idea of evolution has continued to be central in your work.*

David: To me, it's absolutely essential. In a sense, what we're going through is science trying to grow up to reach the level of positive spirituality at its best.

Russ: *That's a fascinating concept.*

David: Take Jesus or any of the great spiritual visionaries. They had an intuitive feeling for transdisciplinary systems of science. They had an intuitive grasp of the process of evolution. In the case of Buddhism and Hinduism, they go beyond and embrace the entire life/death span within a larger picture of reincarnation and karma. That's the direction in which science is now moving. It's trying to substantiate this larger picture of life, of death and of life embracing death and moving on through time.

It's a magnificent perspective to get into. The more you get into it, the more you see that we are still in a baby step phase in mainstream science. For instance, my close friend Ervin Lazlo has been writing for years now about the Akashic field and all the sciences supporting the theory of an Akashic field—holographic brain theory and all sorts of different theories and evidence supporting the idea. He's now got a new book coming out in January called *The Akashic Experience* in which I've got a piece on my own investigation of a past life. It's out on the fringe with people who are not afraid to explore the paranormal that science is moving. And, as I say, science is beginning to reconnect with and try to catch up with the non-scientifically verified, non-scientifically grounded, but intuitive vision of the great Avatar.

Russ: *Ken Wilber talks about the traditional sciences with the insistence on measurability or observability as "scientific reductionism." Interestingly enough, it's out in the world of science that new ground has been breaking over the last few decades that charges us to be looking at life and experience in the world and the universe from a far greater and more complex perspective. I'm reminded of David Baum's notion of the implicate order. Lazlo's Akashic field is another example. So are Ralph Abraham's work with self-organizing systems and other applications of chaos and complexity theory. All of these point to a movement that I think is about what you're describing.*

David: And one of the central points is a matter of passion with me, because I have a long background in measurement. Wilber can knock measurement, but that's because Wilber had no training in scientific measurement. He never had to learn statistics or run an experiment. He worked entirely out of books and the power of cognition. The great power of science from the very beginning with Galileo has been the power of measurement as a means of verification. I've developed a number of measures. Currently, I have a measure that pulls all this together—the whole evolutionary system, including the science perspective and an understanding of evolution in terms of 15 basic indicators of evolution. I developed an instrument I call the Global Sounding. I explain it in *Bankrolling Evolution* and in *Measuring Evolution*, a guide for using it. Once again, within my perspective, it's action research. This instrument has a way of putting all of this to use. It can be applied to any program, any project, and assist us to reach a decision on whether that program or project will advance us, check us in place, or drive us backward in evolution.

Russ: *Ken Wilber's background was in science before he went off on his more esoteric directions, and I would think that what he would say is not that measurability is not important, it's just not the only thing.*

David: I had in mind the traditional grounding in science involving experiments, statistics, mathematics, which I would be surprised to learn he really had. This is not the discount the fact his is a brilliant exploration pushing science in vital new directions.

Russ: *What you've done with the Global Sounding is at least come up with some indicators that we can look at and assess what's going on in terms of levels of evolution. Can you give an example of the indicators and what you mean by "self-actualizing?"*

David: I take 15 indicators and the science supporting each one of these indicators. I start with cosmic evolution, chemical evolution and then biological evolution on the natural scientific level. There's a transition—the evolution of the brain is the step beyond that. Then you enter the range of cultural evolution with psychology, sociology, political science, economics and technology. The great power of this instrument is that I added an indicator for moral evolution, which to me is critical—spiritual evolution, evolution of consciousness and evolutionary action at the top. In other words, what is the purpose of gaining a doctorate or going to school or writing books if you're not going to put it to use in trying to make life better? So that's the orientation.

Russ: *You're suggesting that the evolution of the brain is being studied in terms of historical evolution as well as in the lifetime of an individual?*

David: Yes. I formed the Darwin Project with a founding council of over 50 leading American, European and Asian scientists. Among the founders were Paul MacLean and Karl Pribram, the two greatest living brain scientists. MacLean's work definitely tracks evolution in all the subspecies, stage by stage, to the human. Then, in the human the whole development of this can be found in MacLean's book, *The Triune Brain*. It's also in Karl Pribram's writings to a certain extent.

Russ: *Then is it fair to say that for individuals there are stages of development in one's lifetime?*

David: Oh, yes. I particularly write about the stages in moral development. Piaget did magnificent work. Kohlberg took a crack at it and advanced it in many ways, but blocked it in others. Then Gilligan came along and advanced out of the Kohlberg bind on sex and gender.

Russ: *Have you looked at Robert Kegan's work or Jane Loevinger's work?*

David: Minimally. I'm mainly grounded in Erikson.

Russ: *Is this because ultimately it's more about the development of the moral and the spiritual and consciousness aspects that intrigue you?*

David: Yes, it very definitely is. You can't know everything or try to know everything, so I'm focused on moral development.

Russ: *Are there stages that you see that are useful to think about in moral development?*

David: Yes, and I'm trying to think how you'd characterize that. I've written about this in a book of mine called the *River and the Star*, which is actually the first book for my seven-book "Moral Transformation Cycle." The first book is *River and the Star: The Lost Story of the Great Explorers of the Better World*. It's possibly the best thing I've ever written. It's out there with all the online booksellers worldwide. I write about Piaget, for example. Today, we've focused on the cognitive development he wrote about and forgotten about the moral development work that came earlier, but it was the most brilliant of all.

Russ: *Interesting. So Piaget is another example of someone who has written about moral development—not just Darwin—and that portion of their work is being ignored.*

David: Yes, and that's what I'm addressing in the *River and the Star*. I start with Immanuel Kant. Who really pays any attention to him except for dull philosophers these days? But he was a fireball! I move on to Herbert Spencer. Everyone writes him off as this right-wing ideologue. Well, he had some very important things to say about moral development. Marx and Engels—they're the demons, you know—but they significantly advanced our understanding of moral development. I go into Freud and Emile Durkheim, who is one of the towering figures in the study of moral development, then on to Piaget and into the work of many people who I've worked with or knew, like Ashley Montague and Milton Rokeach. I used to work with Milton and it's a magnificent story. And I include all of that work, except for the most recent, Carol Gilligan's, because she's still living and tied to the Women's Movement. Hardly anybody pays any attention to it anymore so I'm determined to shove it at them.

(laughter)

Russ: *And you really do. In* Bankrolling Evolution*, if I can quote in the last chapter you say that there is a list of suggestions "…for healing through progressive political action, progressive money, progressive science, progressive education, progressive entertainment, progressive morality and progressive spirituality. To this pharmacopeia, we must add the case made in this book for the inevitability controversial but now essential development and use of a new psychiatry and management science of evolution." Tell us about that if you will.*

David: That's quite a mouthful.

Russ: *I know!*

(laughter)

David: I got into the psychiatry of evolution during *The Healing of a Nation*. We had to move beyond simply a psychotherapist with an individual or group or family as her client and look at the whole nation. In that book, I get into pointing out the pathology that we have tolerated, enabled and followed in the case of Bush. Here's a psychological basket case when you know his make up in psychiatric terms, which I include in that book. I also probe the pathology of his enablers and followers of which so much emerged during the McCain-Palin campaign for the presidency. I show how what we endured during the eight years of the Bush administration was the eruption of the pathology of the third generation of the people originally studied by Adorno, Frenkel-Brunswik and Levinson and Neville Sanford in the famous authoritarian personality study.

Russ: *Yes, it came out of World War II.*

David: Right, the Bush years' disaster also reflected the findings of Stanley Milgram on obedience to authority—

Russ: *These are the Stanford studies you're talking about.*

David: Yes. The Bush years also reflected the studies of Solomon Ashe on conformity. Of course it wasn't simply Milgram and Ashe. There were hundreds of psychologists and sociologists exploring this widespread social sickness. They were warning that, as a country, we had to do something about this, because we had, in my terms, this sick subpopulation, originally called "the lunatic fringe of the right wing," which became strengthened through the coup of the past 30 years that took over the country, culminating in the Bush-Cheney disaster.

The point I'm getting at is we can't afford this sort of thing any longer. We have to institute a new healing-oriented approach to the sickness of the nation, America, that involves healing the rest of the world. This is one reason I'm pushing Obama: because Obama by nature is a healer. Biden is also a healer by nature. It's healers versus dividers at this point. That's what I'm getting at. We have to launch a new science that is sensitive to the emergence of pathological leadership, pathological enablership and pathological followership and that warns and educates the nation against ever again being suckered into the snare of these people. We have to strengthen and more greatly empower the progressive vision. This is the need I write of in *Bankrolling Evolution* and *Measuring Evolution* for a psychiatry of evolution.

Russ: *You also write about a management science of evolution, which parallels this in the areas of business and organizations.*

David: Exactly. You can have a psychiatry of evolution and you'd have this vast exercise involving a bunch of very bright academically-trained people who are not forced by interest or circumstance or tradition to get down there in the trenches and work to make things better. They're also people who have been oriented for at least a century now in the healing of the individual, the group, the family, etc. The idea of sending them out to heal a whole nation—why, that's just screwy to them. But it's not to the management science orientation.

The beauty of the whole field of management and organization science is that it's action-oriented. Take the problem and bring together whatever's needed to solve that problem and you get paid for it. The academics get paid for teaching whatever limited understanding they have to a fresh crop of little people who are yearning for a larger picture. What they get too often is a succession of tame disciples imprisoned within barriers to the larger vision. To me, you have to have both.

Russ: *Management science then is the part that corresponds to action, which has such preeminence in your work.*

David: Yes.

Russ: *In terms of the future—both in the way we are developing and evolving and thinking about thriving, if you will, in the universe—what do you see as being the greatest indicators of potential success?*

David: The greatest indicators of potential success are the ones we have to hang onto these days, because we can work our rear ends off and still go down the drain—

Russ: *I know. I'm looking for a little hope here.*

(laughter)

David: To me the hope is all these bright people coming into the picture. My wife, Riane, is now doing coursework with students at California Institute for Integral Studies and I see them. The kind of people that are being attracted to CIIS and in pockets to universities all over the world are young people who come in and they see that the elders are in that secure position of knowing that they won't be around when the world goes down the drain. But the young ones say, "Hey, if I'm gonna have a good quality of life, I need to do something about this!"

The older generation is just not doing it. And that's our hope—and it's not just the young ones. That's why what is going on at CIIS and at other places so greatly interests me. The pattern is for people to be involved who've been in business or in all kinds of activities during the years when they had to make a living and raise a family are now middle-aged. They've gone through a divorce, the kids are grown and gone, and they have the freedom at last to change. What they want to do is go back to school, get their degrees in order to jump in with the younger generation and work like hell to save our species and the planet from eventually going down the drain under all these challenges.

Russ: *If the hope is that more and more people, young and old, are turning to try to find more of what I call holistic or progressive solutions to the problems we're facing in the world, what are the things that you think would be most important for us to be focusing on in terms of our development as a culture, as a people?*

David: To me, the name of the game is moral evolution. I can track every problem we face today and at the root is a lack of moral strength. It used to be called character. It's a grounded sense of right vs. wrong. Some people may think that's right-wing. Part of the problem is the conservatives have seized up the word "moral" and are trying to club everyone else with it by saying they are moral and the rest are Satan's spawn.

I'm talking about progressive morality, progressive moral sensitivity, progressive moral evolution, not check-us-in-place or drive us backward morality. We need to get this into the schools. Kohlberg tried to do this. You run up against the separation of church and state requirement of the Constitution, which is essential. But we've got to get progressive moral education into homes and schools K-12 into the collegiate years.

It's not there now, except in pockets—theological seminaries or special courses—it's very rare in college. Where the courses exist, they are in the evangelical, right-wing colleges. What galls me is the people who have been the ruination of this nation have had this tremendous training in regressive morality. It's mirrored in the Islamic world of these radical, right-wing schools. They have this generation after generation repeated grounding in the regressive code of morality. We have to develop a comparable system for this type of thing in the progressive schools.

I cover this problem and solutions from I believe A to Z in the six books of my "Darwin Anniversary Cycle" and the seven books of my "Moral Transformation Cycle," most particularly in the "Glacier and the Flame" trilogy. There I differentiate dominator moral insensitivity and dominator morality from partnership moral sensitivity and partnership morality in relation to Riane Eisler's fundamental work on domination and partnership systems. That is what we have to get across. Today, we live in this hybrid world where we're hit with both versions; we're muddled and mixed up. You go to church on Sunday, you tithe and go there on the holidays. But in the meantime, the other six days of the week, the orientation is screw your neighbor. Instead of "Do unto others as you would have them do unto you," it has become, "Do unto others before they can do it unto you." That's the regressive dominator morality.

Russ: *David, there are so many different avenues we could explore and one of the things I deeply appreciate is your ability to reach out and hold multiple perspectives.*

David: Thank you. In the book, *Measuring Evolution*, in terms of action-orientation, I take the Global Sounding measure and show how it can be used in specific scenarios relating to business, government, politics, foundations. Leadership in all of these areas is confronted with mountains of projects and programs clamoring for money—how do you differentiate between those likely to advance human evolution versus merely check us in place, which can be disastrous these days, or those likely to actively drive us backward in evolution? The Global Sounding allows you to carefully calibrate the differences between two good projects as well as the good and the bad.

I've also developed the Global Sounding Moral Code. I've taken each of the 15 indicators and translated them into a scientific global ethic to provide a code for how to advance yourself, advance the world and advance your children, morally.

Russ: *What is the article that you're including in Laszlo's new book in dealing with a regression into a past life.*

David: It's an article called "Return to Amalfi." I've written a book with the same title, which I'm rewriting into a second edition now. I tell of my first visit to Amalfi in Southern Italy in order to investigate whether I lived there 300 years ago as an Italian spice merchant. It checked out. I'm convinced.

Russ: *Where did you get the idea that you had lived there in an earlier life?*

David: I went through a past life regression—you know, we psychologists can do these weird things.

(laughter)

David: I got curious about past life regression and the one that intrigued me the most is I'm a spice merchant in the year 1611 in Amalfi, Italy. One of the things that grabbed me about it is, if I'm just making this up, why didn't I make myself up as Michelangelo or somebody more famous? Why would I pick the life of an obscure spice merchant in Amalfi, Italy? I went there and found that, by gosh, an awful lot of it rather hauntingly checked out.

Russ: *Can you give an example?*

David: In the session, I saw this town on the side of a mountain with a succession of green plateaus and red tile roofs going down to the ocean. I had been to Italy before, but had never seen anything like that, because I was in Northern Italy. I asked an Italian friend about it and he said that would be Amalfi. I went there and that was it. In my visioning, I also saw the harbor where the dock was that went out into the bay. I went there and it was the same exact thing. I found confirmation of the stones underfoot; the gradation that I saw originally was there. All of these things were substantiated by certain things that have happened in history. It was a revealing experience.

I discovered through going there and doing some historical research that I could even develop a sophisticated psychological portrait of the situation of that spice merchant in 1611 and why he felt so strongly about certain things. He hated the church and doctors and the upper class. I found the reasons in history for exactly the emotions and the actions of this particular spice merchant in Amalfi at that time.

Russ: *So you actually ended up encountering the dominator model in that past life?*

David: Yes, and I was able to relate it to Riane's work in *The Chalice and the Blade* and the books on the historical and pre-historical picture of the clash between the partnership and the dominator ways of life.

Russ: *How has that experience impacted your work today?*

David: Well it has convinced me beyond a doubt that in gross, simple scientific terms, we've been taught for about a century now that everything we are consists of the influence of genes and of environment. I now know we are the product of genes, environment and past life.

Russ: *That's fascinating and I'm looking forward to reading the book. By the way, Ervin Lazlo is on our board for* Integral Review *and I'm sure he'll be interested in reading this interview and the kind things you have to say about him.*

David: Yes, I hope he will.

Russ: *Well, thank you very much.*

The Global Sounding

How to use It In business, government, politics, science, education, writers, the media, nonprofit and religious organizations, and philanthropists and foundations

The Global Sounding is designed to be used as a leadership guide to the investment of time and money in all of the above and other situations calling for the *right* decision in our lives today.

Focus on whatever cause, project, or policies you are considering putting time and/or money into. Then follow these steps using the Global Sounding User Form.

1. Write down cause, project, or policy in the bracketed blank at the top.

2. With this subject in mind, scan down through the Indicators of Progression (+) and the Indicators of Regression (-).

3. For each level or activity of evolution (first column), ask yourself whether by investing time or money into the proposal for testing (your entry in the blank at top) you are likely to influence evolutionary *progression* (second column).

Or evolutionary *regression* (third column).

Or neither.

Or the question at this level or activity for evolution is just not relevant in your case.

4. If it seems the proposal might influence evolutionary *progression*, in the fourth column enter a plus (+ 1) in the blank.

5. If it seems it might influence evolutionary *regression*, in the fourth column enter a minus (– 1) in the blank.

6. If it is hard to guess whether it would be of influence either way, or otherwise seems irrelevant, enter zero (0) in the blank.

7. At the end, add up your pluses, minuses, and zeros, and enter the result in the blank for the Global Sounding Total.

The Global Sounding Moral Code

A translation of the fifteen basic indicators into equivalent tenets for a new Global Ethic

1

Honor and respect rather than plunder and rape our living
environment.

2

Honor and respect Earth as the Mother of us all
rather than sell her into slavery.

3

100 years of science tells us Earth can still provide the
resources for health for all of us if given a fair
and practical human distribution system.
Establishing health systems for the many rather than
the chosen few is the moral requirement,
and must be our goal.

4

100 years of science tells us that a healthy brain and
healthy mind depends on adequate food
and love in childhood.
Thus nurturing and expanding, rather than
starving and blighting, is the moral requirement
for the feeding of brain and mind,
which must be our goal.

5

Mind is the precious gift of life to be nurtured, enlightened,
and celebrated, rather than orphaned at birth and
thereafter degraded and exploited.

6

Culture is *the most precious gift of evolution,*
to be cherished and nurtured in the wonder of its diversity,
rather than seized, shucked and twisted to serve low ends.

7

Over thousands of years freedom and equality have been
and will remain the most precious goals for evolution,
rather than just words to be used by power-mad
deceivers to sell control and inequality.

8

Three hundred years of capitalism and two hundred years
of communism have shown us that a fair, peaceful, and
practical distribution of Earth’s bounty requires
a balance of public and private governance,
rather than the breeding of misery, war, and
corruption with a shift in overwhelming
power to one or the other.

9

Democracy,
rather than the sham of the oligarchy of
wealth, the creep by stealth toward
fascism, or the prison of
any other form of tyranny, is a moral requirement,
and must be our goal.

10

Education for all,
rather than the fact of good schools for some
and bad schools or no schools for all
others, is a moral requirement,
which must be our goal.

11

Develop technologies to strengthen and expand the voices
of caring and reason and the abundance of life,
rather than technologies that ever more
powerfully threaten to, and indeed then
are driven to, launch and kill life

12

Differently stated but the same for all, the message
of thousands of studies of progressive science is exactly
the same as for thousands of years for progressive religion:
Do unto others as ye would have them do unto you—rather than
do it unto others before they can do it unto you.

13

Affirm our identity but also our responsibility in tandem
with a greater being, a greater reality, or a greater
mission, rather than fool yourself by claiming
some one and only holy being, idea, or cause
for your own low ends.

14

The most precious gift of evolution is consciousness.
Love, nurture, and expand it, rather than
automatically seek to narrow, blunt,
or otherwise slap it into shape
and seize the pitiful remnant
for your own low ends.

15

For over 100,000 years the choice before our species
has been unchanging. Either join those who take action
on behalf of the better world, or fall back in shame or ignorance
with those willing to sell out to the highest bidder and
join the march to extinction.

The Toxic Effect on Children of a Degraded U.S. Society, Family, and Educational Context: How Will This Nation Respond?

Carol Hoare

Abstract: This paper explores the relationship among conditions in U.S. society and families and U.S. educational achievement data. Such information, along with related data from 30 OECD countries, shows a marked decline in the U.S. as a context for child development and learning. The focus of the paper is on indicators of decline. Data from the *2008-2009 Measure of America* Human Development Report of the Social Science Research Council, as well as related economic and educational data, are highlighted. A point elaborated throughout is that schools are but a microcosm of society, and that they alone cannot rectify educational deficits. In the concluding section questions are posed about the will of U.S. citizens and representative institutions and groups to engage in serious change efforts.

Keywords: Achievement rates, American competitiveness, human development, literacy, school drop-out rates, foreign competition

Introduction

When one reads the latest Human Development reports, related economic data, and various reports on the problems of U.S. educational systems, our decline as a country is apparent. This decline is no longer in the future as some might claim but is our present and worsening condition. If we temporarily set aside the 2008 global financial crisis and its immediate effects, markers of this society's deterioration have been with us for some time. The overall context for child and adult development, good health, learning, and economic sustenance is in trouble. In this brief article, I focus on indicators of decline in educational achievement, societal markers of deterioration, and the degradation of the family as the child's bedrock for growth and development. A complex relationship exists among social and family conditions, children's needs for nurturance, structure, examples of deferred gratification, and a work ethic, deteriorations in public education, and the skills needed by the American workforce. All are essential to national development. Yet together they paint a picture of elapsed achievement needs and toxic, troubled waters for our children and society.

Two overarching points anchor this article. First, we live in a criticizing society, one in which it seems that blame must be cast on one institution or another. As Erik Erikson (e.g., 1968, 1975) held, adult humans are the moral and moralizing subspecies. Too quickly, we judge individuals and groups, failing to first ask what observed behaviors mean. When we judge, criticize, blame, and propose remedial help as the first order of business, we fail to study and grasp the complete phenomenon and its meaning. In the process adults often project their own feared deficits onto other individuals, groups, and institutions (e.g., Hoare, 2002). With respect to public education, some experts have too easily separated institutionalized educational endeavors from other

SOME RIGHTS RESERVED

contributing factors, and have been far too quick to blame schools alone. Other experts have recognized the panoply of externally induced disorder but believe that the school can remediate society's and the family's problems. The American public school, with more on its plate each year (e.g., immunization clinics, custodial after school child care, security requirements) has its share of difficulties. Yet it alone is not responsible for U.S. problems nor can the school alone solve them.

Second, each nation's children are a mirror to their society, to its current condition, achievements, promise, and deficits. Along with the elderly, poor, and disenfranchised, youth comprise the vulnerable among us, those who most need protection and nurturance. Children are our future, those whose gift of innocence shows adulthood as but a deficit condition, especially lately. In his last book, the late Urie Bronfenbrenner (2005) cautioned, "The major social changes taking place recently in modern industrialized societies, especially the United States, may have altered environmental conditions conducive to human development to such a degree that the process of making human beings human is being placed in jeopardy" (p. xxvii).

In particular, Bronfenbrenner held that the family had largely become a "chaotic system," one in which "frenetic activity, lack of structure, unpredictability in everyday activities, and high levels of ambient stimulation" are daily experiences (p. 14). At best, such family conditions place youth in serious jeopardy, dimming their ability to concentrate when in school and study well at home. At worst, youth engage in substance abuse and risky sexual behavior. They drop out, run away, and commit suicide. With respect to drug use, for example, Friedman (2006), cited data showing at least a 50% illicit drug use among recent high school completers. Street drugs are now supplemented with illicit parental and internet-obtained prescription drugs. Interpreting large scale national surveys and follow-up interviews with teens, Friedman found that youth drug use meets both their recreational and practical needs. Recreational needs are met with "Pharm" (pharmacological) parties where street and prescription drugs are often combined. Practical needs are met with stimulants to bolster school performance, hypnotics to induce sleep, and tranquilizers to reduce stress. Teens are emulating the behavior of their role model parents and other "adults."

With these points before us, we look to the societal and family problems and effects that place children in jeopardy for achievement and related problems. As for all of us, children live in an ecological niche that variously supports health, learning, and various forms of development. Parents, peers, extended family, neighbors, and others are part of that niche. The school too, with its calm or violent students, clean or debris ridden halls, and caring or cantankerous teachers, is part of youth's overall environment. For a number of good reasons American public education, its professionals and students, is in the limelight. Drop-out rates have risen, precarious conditions exist in "failing" schools, many teachers are substandard or are teaching subjects they have not mastered, and inflated bureaucratic costs curtail actual resources that students receive. These serious problems require sustained attention, but schools do not bear the full brunt of responsibility.

One way of considering a range of data regarding U.S. educational and related conditions is to compare this country with other affluent nations. Another is to examine data within the U.S. alone. We begin here with international indicators and then move to within-country conditions. First, therefore, how does the U.S. fare internationally?

Human Development Indicators: U.S. Comparisons with Other OECD Nations

For a number of years, international human development information has been compiled by the Social Science Research Council (SSRC). Its data are fundamental to the international comparisons examined in this paper. The SSRC, in its most recent volume *The Measure of America 2008-2009,* largely reports comparisons among 30 Organization for Economic Co-operation and Development (OECD) countries. The *Measure* report takes the position that the most frequently used indicators of U.S. development are inadequate. Gross Domestic Product, (GDP), Gross National Product (GNP), stock market performance, consumer spending, international trade performance, and similar indicators provide information about American life and competitive success. But these lopsided, “alienated variables,” important as they are, spotlight fiscal and resource comparisons which incompletely characterize a nation’s overall quality of life (Burd-Sharps, Lewis & Martins, 2008, p. xi). The SSRC looks to a wider array of indicators of the lives of U.S. citizens. These include social, environmental, educational, health, economic, psychological, equality, and other conditions that form the basis of daily experience.

The SSRC uses three broad criteria of individual development: (a) a healthy, long life (e.g., safety, good life expectancy, low infant mortality); (b) access to learning and knowledge (e.g., literacy and high school completion rates); and (c) a decent standard of living (e.g., median income). Using these three major Human Development criteria, the U.S. shows an overall decline since 1980. Among the 12 top-rated countries on the “global” index of Human Development, the U.S. fell from second place in 1980 to twelfth place in 2005. The global rating is based on data showing the effectiveness of countries to convert income into favorable health, safety, educational, and life expectancy outcomes for citizens. In twelfth place with respect to this effectiveness-of-conversion standard, the U.S. is now behind Australia, Canada, Finland, France, Iceland, Ireland, Japan, Netherlands, Norway, Sweden, and Switzerland.

Parsing several specific indicators that comprise the global rating, life expectancy, health, safety, literacy, and educational achievement markers are paramount. With respect to life expectancy, personal health is included in longevity. For example, obesity is a key predictor of poor health and diminished longevity, and obesity among U.S. children and adults has escalated dramatically in recent years.

In life expectancy calculated from birth, in 2005 the U.S. ranked 24th (77.9 years) among 30 OECD countries. Japan is first with the greatest life expectancy at birth (82.1 years). Among those same 30 countries the U.S. ranked first in 2005 private and public dollars spent on health care per capita ($6,401). Japan, ranking first in life expectancy among the OECD nations, spends far less ($2,358 per capita), ranking 19th in per capita health care expenditures. U.S. health care costs have soared and the return on investment plummeted. Yet 47 million persons in the U.S., about 16% of the population, lack health insurance. Although conditions vary by ethnic and racial grouping, by State, and by Congressional District, among those most at risk, in 2008 African Americans have nearly 97,000 excess deaths per year compared with Caucasians. They have shorter life spans today than all Americans in the aggregate had in the late 1970s.

The SSRC Human Development index of life expectancy includes an assessment of the aggregate population and of racial and ethnic groups. Its life expectancy composite ranking is based on actual life expectancy at birth, percent enrolled in school, percent completing high school, percent with a Bachelor's degree, percent with a professional or graduate degree, and median earnings. Using these combined criteria U.S. Asian Americans rank first, Caucasians second, Latinos third, American Indians fourth, and African Americans fifth. Asian Americans constitute only about four percent of the population but outperform their U.S. peers at all levels. As Abboud and Kim (2006) claim, their success is based on the ways Asian Americans are cared for and brought up and the instillation by their parents of a love and desire for learning.

With respect to safety, homicide rates are one indicator of safe environments. The U.S. homicide rate is nearly five times that of the OECD average. If the U.S. and Japan showed equivalent homicide rates, the U.S. would have had 1,500 homicides in 2003 instead of 15,000. Other data on child safety and health place the U.S. at the bottom of 24 OECD countries. For example, the U.S. infant mortality rate, that is, death prior to the end of the first year of life, declined for five decades but has gone into a holding pattern. Infant mortality rates in the U.S. are now approximately that of Croatia, Cuba, Estonia, and Poland. If the U.S. infant death rate were the same as Sweden's, more than 21,000 babies each year would reach their first birthday.

Literacy of a population is prerequisite to access to knowledge, better health, improved longevity, and a superior standard of living. Across all 30 nations, high life expectancy, good wages, low infant mortality, and low birth rates are the result of high societal literacy rates. Plotting from age 35 until death, each additional year of schooling increases life expectancy nearly two years (Burd-Sharps, Lewis, & Martins, 2008).

Achievements in adult basic education are workforce and life success factors for many individuals. In 2002, 40 to 44 million adults, 21 to 23% of the adult population, functioned at Literacy Level 1, the lowest literacy level of the National Adult Literacy Survey (NALS). At this skill level they cannot add well enough to compute the purchase costs of several items, read a medicine label, interpret bus schedules, or enter personal information on an application. Another 20% function at a somewhat higher eighth grade level (Wedgeworth, 2003, 2004). Assuming a best case 70% high school or General Educational Development (GED) completion rate in this population (Grey, 2008) and 40% who are functionally illiterate, it is clear that secondary school completion does not guarantee literacy.

Low educational achievement among parents (which correlates with low literacy and other substandard skills), is bequeathed by parents to their children. This trickle down effect buckles children's chances in academics, high school completion, and, later, job access and performance. As the scores of third, eighth, and 11th graders show, children of parents without a high school diploma are the poorest performers on reading assessments. Children of high school completers consistently perform better, and children of parents with education beyond the secondary school level perform best. Wedgeworth (2003) found that these relationships have not changed since 1971.

These and other data lead one to conclude what has been clear for some time. Parental participation in literacy programs leads such parents to place a higher value on education than non-participants. Parents who engage in literacy programs pass educational achievement values along to their children. Increasing literacy due to parental participation in adult education programs also results in increased parental participation in their children's schools, heightened achievement among those children, less school absence, increasing scores on intelligence tests, and higher rates of high school completion (e.g., Wedgeworth, 2003).

In secondary school and college completion, the United States, once first in the world in literacy and graduation rates from high school and college, now lags other nations. In 2004, U.S. high school graduation rates trailed six other countries: Canada, Finland, Japan, Norway, Sweden, and Switzerland. The decline in the U.S. is cohort specific. For example, when Goldin and Katz (2008) compared secondary school completion rates of those in the age group of 25 to 34 years against those 55 to 64 years of age, in 2004 the U.S. ranked first among 20 premier OECD nations when the older cohort was considered, but seventh for the younger cohort.

The U.S. is also behind in high school quality standards. As Goldin and Katz hold, international math and science knowledge represent the “gold standard.” Results of the 1995 Third International Math and Science Study (TIMSS) found the U.S. lagging in mathematics and science knowledge at the twelfth grade level. Among 20 nations in the TIMSS, scores of students in 14 other countries were markedly higher than those of graduating seniors in the U.S. In 2003, the Program for International Assessment (PISA) found that 15 year-olds in the U.S. were considerably less knowledgeable in problem solving, math, and science. According to PISA results, the U.S. placed below the average of OECD countries.

Further, although U.S. college attendance has risen considerably in recent decades, that is, from 44% of 20 to 24 year olds in 1980 to 61% in 2003, four-year college graduation rates have deteriorated. The trend has placed the U.S. college graduation rate at the average of OECD nations and behind 12 other affluent countries (Goldin & Katz, 2008). Countries previously far behind the US in 1960, had closed the gap by the early 2000s. By 2004, Norway, Switzerland, Canada, Sweden, Japan, and Finland were far ahead of the U.S., while Germany, Denmark, Austria, and New Zealand were almost at U.S. levels.

U.S. Education, Learning, and Achievement

Looking now to within-country data, the recent spotlight on public education began in the 1970s. By 1975, analysts noticed changes in U.S. educational achievement and related indicators. High school graduation rates, which had been on the upswing since 1890, had stalled; college completion rates began to decline. The wage distribution that had been narrowing since 1939 began to widen, in effect erasing the gains of the 30 previous years. Inequality was ticking upward and national economic progress had begun to deteriorate (Burd-Sharps, Lewis, & Martins, 2008; Goldin & Katz, 2008). The wealthy were becoming wealthier and the poor far poorer. Parallels began to be drawn between a beginning economic downturn and declining high school and college graduation rates.

By 1980, muted rumblings were heard about clear markers of the nation's educational and economic downturn. Foreign made products permeated the U.S. marketplace, skills of the American workforce were found deficient, and critics turned their eyes to public schools in full force. In 1983, a national commission assessing public education published *A Nation at Risk* which catalogued complacency and "mediocrity." Mediocrity was largely attributed to school failures. School reform efforts of various types were instituted. These continue to the present.

Now, in 2008, educational outcomes among high school and college youth point to grave conditions and an uncertain future. Among the key conditions, high school completion, preparation for college, college completion, and GED equivalency are important. These indicators are substandard in a country and era that require an educated, literate, numerate, and scientifically accomplished work force. Levine (2006), the National Center on Education and the Economy (2007), Goldin and Katz (2008), and many others have warned that the deterioration in school and student achievement means that the U.S. will not long be able to compete successfully in a shrinking global economy. Many hold that U.S. public education systems are largely incompetent.

If we ask what it is that buttresses such conclusions, secondary school completion rates are part of the picture. National data are incomplete and inexact; however, depending on the source, the average high school completion rate in the country is between 66 and 88%. The graduation rate for African Americans and Hispanics is far lower, between 50 and 85% (see, e.g., Heckman & LaFontaine, 2008). Further, there is a difference between dropping out and being forced out. A number of secondary school students are now "pushouts," those who are encouraged by education officials to leave school. When youth are classified in categories that carefully conceal their status, the system's cleaned up data are shown as better than they actually are. Technically, data then reveal far fewer high school drop-outs than actually exist. For example, Wedgeworth (2003) cites information showing that New York City public schools pushed out 55,000 secondary school students in 2000-2001. If this is anywhere near correct, comparing that number to the system's approximately 34,000 high school graduates in the same academic year shows unconscionable, unethical behavior among those responsible.

Each year, between 10 and 20% of the high school completion rate is accounted for by GED equivalency certificates. This inflates graduation rates and biases the data in other ways as well. Heckman and LaFontaine (2008) claim that, in the workplace, GED recipients function at the level of high school drop-outs. And, since 2000, even GED equivalency completion has declined dramatically. It is now at levels reached in the last years of the 1970s (Goldin & Katz, 2008).

There is great disparity between student performance in suburban, white schools, many of which show high graduation rates, and student performance in densely populated urban areas where school success is variously valued and graduation rates are low. In 50 major cities in the U.S., the average high school graduation rate is 58%. In 17 of those systems graduation rates are 50% or lower. For example, high school graduation rates in Baltimore (Maryland), New York City, Columbus and Cleveland (Ohio), Philadelphia (Pennsylvania), Atlanta (Georgia), Detroit (Michigan), and Indianapolis (Indiana) are 35%, 47%, 41%, 42%, 50%, 46%, 25%, and 30%, respectively. Urban decay and impoverished families characterize major parts of those cities. When we compare the graduation rates of, for example, the suburbs surrounding Baltimore, New York City, Columbus, and Philadelphia, the graduation rate exceeds 80% (see Grey, 2008).

The prison population compounds the drop-out picture. The U.S. holds five percent of the world's population but one-fourth of its incarcerated (Burd-Sharps, Lewis, & Martins, 2008). Prison inmates are included in the count of GED recipients. Some claim that the GED has no effect on skills, earnings, or recidivism in this population (e.g., Wedgeworth, 2003). With approximately 110 inmates per 100,000 persons from about 1925 to 1975, the U.S. incarceration rate did not change dramatically. But by 2007, seven in 1,000 U.S. residents were imprisoned yearly. The SSRC found that in many poor communities, direct experience with the criminal justice system is so common that it has become a "normative life experience" (Burd-Sharps, Lewis, & Martins, 2008, p. 142). Those who do not graduate from secondary school are eight times more likely to be incarcerated. By their 35th birthday, 60% of African American high school drop-outs will have been imprisoned for some period of time.

Most of us know adults who are trapped by poverty, pre-literacy, minimal job skills, and consequent marginalization: The elder who works at a fast-food drive-through, the 50-something man who loads groceries at the supermarket, the woman who cleans the mall and restrooms in the evening, the immigrant who goes to a designated street corner in hope of a day's work. Many of these "working poor" are largely invisible amidst great national affluence (Shipler, 2004). They are joined by the invisible poor who lost motivation long ago, adults whose "I have not" learned and developed skills eventually became "I cannot" learn and achieve. Among these we number many immigrants (22% have less than a grade school education), inmates (60% are functionally illiterate), and high school drop-outs (60% are unemployed, most reading at a fourth grade level) (Wedgeworth, 2004).

Among the poor, profoundly poor, and working poor, immigrants are prominent. The 2000 Census showed 31.1 million immigrants in this country. This is twice the 14.1 million in 1980 and three times the 9.6 million in 1970. Wedgeworth (2003) cites data showing that approximately one-third of current immigrants came to the U.S. since 1990, and that one out of five children under the age of 18 has an immigrant parent. Poverty among the total immigrant population is astounding, accounting for 25% of the U.S. residents who live in impoverished conditions. Heightening their burden, nearly two-thirds of second-language immigrants in the age range of 16 to 65 are at the National Adult Literacy Survey (NALS) Level 1. At this level they cannot read well enough to decode simple, written English material.

College Level Preparation and Success Indicators

Clearly, reading and math skills are mere barebones accomplishments for today's and tomorrow's work force. Literacy for 21st century jobs requires analytical abilities, technological competence, ongoing learning, flexibility, and, for many, superior content specialization. If we use this higher level of literacy than is typical of U.S. standards, Drago-Severson (2004) estimates that 90% of the U. S. workforce likely requires some form of remediation.

With respect to achievement in high school as this relates to preparation for college, only 22 of 50 states require students to pass achievement tests as a condition of graduation. Most of the tests in use employ 10th grade or lower standards (Strong American Schools, 2008). Based on international standards such as those tapped by the TIMSS and PISA, most states peg their high school graduation standards to an eighth grade level of mathematical and English literacy

(National Center on Education and the Economy, 2007). The 2008 “Diploma to Nowhere” report of the Strong American Schools group shows the minimal connection between learning in high school and the abilities students need to engage successfully in college courses. Yearly, 1,000,000 aspiring college attendees now fail placement tests, and a full one-third of college freshmen now take remedial courses in college just to develop basic skills. This applies to state universities as well as to prestigious colleges and universities where one would expect to find entrants arriving with stellar pre-college preparation. Since the transcripts of four-fifths of students in remedial college courses show high school grade point averages of 3.0 or higher, high school grade inflation paints a rosier academic achievement picture than is the actual case.

The “Nowhere” Report assigns a cost of $2.31 to $2.98 billion per year to U.S. public four-year colleges and universities for remedial work. When remedial courses are required at the college level, taxpayers thereby pay three times, first for kindergarten through elementary school, then for high school, and finally for remediation in college. And American business is paying again at the fourth tier.

Colleges and universities cannot go unscathed in any U.S. evaluation of human and national development. Particularly since 1987 and the firestorm ignited by Allan Bloom’s bestseller, *The Closing of the American Mind*, colleges and universities have been under increasing scrutiny. What, parents and others wonder, is the overall quality of a post secondary degree and the return on investment of what has become an increasingly expensive college education?

Among the latest flurry of books on the subject, Bok (2008) echoes past criticism and declares great portions of college and university curricula “substandard,” and their college graduates “naïve relativists.” With no nationally connected system of education from pre-K to age 18, no national system of adult basic education, and national educational policy that is striking by its absence, college faculties continue to debate whether the aim of college is either vocational preparation or the preparation of graduates with superior analytical skills and great literacy in the liberal arts. While the faculty and administrator are arguing, America hosts a “leaky education pipeline” (National Center of Education and the Economy, 2007). As Hunt and Tierney (2006) found, for every 100 students in the ninth grade, 68 graduate on time from high school. Among those graduates, 40 enroll immediately in college but only 27 of the 40 remain in college the subsequent year. Among those 27, only 18 will earn an associate degree within three years or a baccalaureate degree within six years.

The U.S., with some of the best universities in the world, has difficulty attracting highly competent students who are interested in science and engineering and are capable of stellar performance in these areas. For example, the number of U.S. engineering degrees peaked in 1985 but is now down 20% from that peak. In 2005, 56% of U.S. engineering Ph.D. degrees and 34% of other science degrees were earned by the foreign born. Many foreign nationals with advanced degrees in engineering and the sciences are now returning to their countries where salaries are rising for those who are prepared at post-graduate levels (National Center on Education and the Economy, 2007).

As the U.S. continues its educational and economic decline, citizens across China and India value educational achievement as the road to an improved future. Reportedly, parents and children in both countries value self discipline and a “hunger” for learning which national leaders in those countries are working to underwrite. Changes in earnings due to America’s decline in competitiveness are beginning to show up. From 2000 to 2004, earnings for college graduates fell 5.2% (National Center on Education and the Economy, 2007).

Between 1967 and 2003, on average, those with college or graduate degrees remained in the middle class or moved up into the top earning deciles. In that same time span, high school graduates moved down, falling below the middle class income of $28,000 to $81,000. Some predict that the ranks of the “formerly middle class” will now swell dramatically given the 2008 U.S. banking, housing, and stock market crisis that came on the heels of this nation’s admission to debtor country status (Brooks, 2008).

U.S. Families

Children today live in traditional, blended, single, and non-parental families. The higher rates of disciplinary, motivational, drop-out, and school performance problems devastate the future of many youths who live in broken families. This includes the five million stepfamily children. Comparing single-parent families with two-parent biological or adoptive families, Bronfenbrenner (2005) showed that even in single-parent families with high median incomes, child behavior shows “hyperactivity or withdrawal, lack of attentiveness, difficulty in deferring gratification, poor academic achievement, school misbehavior, and frequent absenteeism” (p. 10). In such families, the context for child development has deteriorated. Citing data from 1996, he held that youth (particularly boys) in many of those families are at substantial risk for what he called the “teenage behavioral syndrome”: “Dropping out of school; involvement in socially alienated or destructive peer groups; smoking; drinking; frequent sexual experience; adolescent pregnancy; a cynical attitude toward work; and--in the more extreme cases--drugs, suicide, vandalism, violence, and criminal acts” (p. 10).

The U.S. Department of Health and Human Services, in 2006, told the country of conditions that impoverish youth developmentally. Citing data from 2002, their report shows the correlation among parental educational achievement, teenage sexual activity, child rearing, child support, and poverty. Focusing mainly on males, data reveal that boys who did not live with both parents at 14 years of age were more likely to involve themselves in adolescent sexual activity; 50% of men minus a high school diploma fathered children outside marriage (compared with six percent among college degree recipients); 50% of the men marrying during adolescence separated or divorced within the subsequent decade (compared with 17% of men marrying at 26 years of age or older); one-fourth of the 28 million men with dependent children do not live with those children (U.S. Department of Health and Human Services, 2006). Teen pregnancy rates which in 2005 had fallen to their lowest level in 65 years, began rising again in 2006. In 2005, unwed mothers accounted for 40% of all live births, an unmarried-mother tendency that has also risen among young women in their twenties.

In monetary and personal resources, including parental presence, positive role modeling, guidance, nurturance, and deep involvement in a child’s life, on average, the contexts of single-parent, stepfamily, and re-combined families provide poor conditions for child development, including achievement. Inadequate structure and discipline with resulting permissiveness, or domination without loving care are two forms Bronfenbrenner (2005) described as family conditions of neglect and abuse.

We know that even in competent, loving families, the fact of two working parents has led to difficulties. Between 1977 and 1997, the number of employees working 50 or more hours per week climbed from 24% to 37%, and commuting time also escalated dramatically (Crouter & Bumpus, 2001; Galinsky, 1999). Galinsky asked a representative sample of more than 1,000 children in the third through the twelfth grades what effects they experienced from the fact of their dual-working parents. Many of the children spoke of serious concerns about parental work stress and its effects on them and home life. Parents, they said, were often exhausted and irritable when home. Some children searched for “mood clues” when parents arrived home. Others removed themselves from parents’ presence. Many children spoke of being harried and hurried. As said by Bronfenbrenner (2005), the family is now a “chaotic system.” Yet it is clear that many parents have no choice but to work long hours. In a family of four, with two dependent school-age children, two parents who work full time at the 2008 federal minimum wage have combined earnings that place family income just above the U. S. poverty threshold.

What Can We Conclude?

Schools have become this nation’s dumping ground. Institutions are always easy to target, study, and blame. But schools, the youth they serve, and the results that emanate, are but a microcosm of society and its effects. Public education cannot do other than fail to make up for what parents and a broader society do not provide and insist on. In order for a correction in the course of a declining U.S. nation to take root, families will have to take the first step. It is the responsible among them who must study and emulate successful parenting of nurtured, achieving children. Studies of Asian American families would be a good starting place.

Societal conditions can change dramatically. One wonders if, with the great will of the past as its backbone, this nation can create structures and resources that target disadvantaged and at-risk children and parents, preferably beginning with the pre-natal period. Can the nation establish a national adult basic education system? Will we restructure the pre-K through secondary education non-system into a national system, one with a basis on the very best evidence-based, effective school models? Will curricula and teaching build youth’s cognitive abilities and, with families, inspire intrinsic motivation that propels a love for learning?

By the close of secondary schooling, youth can possess the proven ability to serve as resources for their own ongoing learning. By then, can a national system insure that they are verbally and mathematically competent and have a substantial base of scientific knowledge? Will graduates have analytical and scientific process skills, know how to access and use appropriate information in defining and solving problems, and possess computer expertise? Will they also understand that technologies will change and will they possess the psychological readiness to change their learning style and competence along with changes in technology? Will they have a beginning track record of replacing obsolete knowledge with the contemporary, thus showing a cognitive flexibility that will be the hallmark of ongoing learning competence?

Colleges and universities can alter their preferential way of existing in the world. Will they reduce the potpourri of courses? Will they insist on and insure superior teaching and advisement? Will they structure the curriculum for a liberal arts education and for those wishing a job at journey's end?

As the Human Development Report of 2008-2009 says, it is not just the education system that requires reform. If the U.S. is to progress in its developmental rating, the sustained commitment of all citizens is required. Will parents invest themselves in their children and schools, and, if necessary, storm the school gates when their children are not taught well? Will civic groups, business and public sectors, religious institutions, government officials, the media, and all others work together toward the common, selfless goal of a better future life chance for this nation's children and their children in the twenty-first Century? That future is yet to be, but will be written, with the nation's responses to such questions.

In Search of Narratives

Sayyed Mohsen Fatemi

This week, I walked through time and places, and bumped into fountain–heads of erudition I had never seen in any class of learning.

I came across a watercourse singing like a crooner. I listened to its reverberation, which deciphered: Every drop in a rivulet is like a cause warmly embracing its effect. I learned causality then.

I ran into wallflowers incessantly genuflecting, benevolently sharing their fragrance and lavishly diffusing their inebriating redolence.

I learned magnanimity then.

I drove into sunlight bravely and bounteously beaming on every thing and every one including the bats.

I learned compassion then.

I crashed in to history rife with narratives burgeoning every where from Babylon to the White House, from abbe to Sir, From Pandora to Spice Girls, from Hades to Las Vegas, from Shinar to seventy-nine Park Avenue.

I came across people wallowing in their stories, vomiting their narratives, wailing for their anecdotes, exfoliating themselves.

I ran into others glorifying their parables, emblazoning their diaries, wassailing for the book of their narratives.

I got baffled, flummoxed and discombobulated by the flurry of commotion, agitation, exasperation, irritation, exacerbation and aggravation, cryptically moving in the pulse of narratives. I drove into people whose prisons were way bigger than Alcatraz; they were the prisoners of their own prisons, the dungeon of hubris, and ignorance.

The train of politics burning narratives as its fuel to carry on the course shocked me, running over narratives to pass by the goals.

I bumped in to the crowd spell bound and transmogrified by the diabolical despotism disguised in enticing cynosures.

SOME RIGHTS RESERVED

I was about to disintegrate, to smash into pieces by despondency and despair when I bumped in to prophets, the gold, the silver, the immaculate chandeliers, festooning narratives with virtue, piety, purity, and integrity, excellence and worth, gilding the lines of narratives with their enlightening souls.

I came across a lady whose heart was more tender than lilacs, who was born out of fragrance and gave rise to sun light.

I paused for a second and I learned how to write my own narrative.

A Tour to the Flea Market of Signification

Sayyed Mohsen Fatemi

I saw a man sitting in the Isle of mysticism.

Sipping the chalice of insight and Gnosticism.

He just got back from a tour.

He got soaked in Romanticism, imbued in Structuralism then indulged in Post Structuralism.

He shook hands with Ire, danced with Strauss, and flirted with Fish.

He read through “The Yellow Wall Papers,” “Life in the Iron Mills,” and “The Awakenings.”

He went through the market to purchase a key to unlock the signifiers.

The market was down. It was empty and dull, according to Derrida.

He got lost on the way.

But he came back right away.

He bought a pair of shoes. Shoes of lunacy.

He said “Good bye” to urgency.

And he is dwelling in
immediacy.

Advanced Change Theory Revisited:
An Article Critique

Quinn, R. E., Spreitzer, G. M., & Brown, M. V. (2000). Changing others through changing ourselves. *Journal of Management Inquiry*, *9*(2), 147-164.

Reviewed by **R. Scott Pochron**

Abstract: The complexity of life in 21st century society requires new models for leading and managing change. With that in mind, this paper revisits the model for Advanced Change Theory (ACT) as presented by Quinn, Spreitzer, and Brown in their article, "Changing Others Through Changing Ourselves: The Transformation of Human Systems" (2000). The authors present ACT as a potential model for facilitating change in complex organizations. This paper presents a critique of the article and summarizes opportunities for further exploring the model in the light of current trends in developmental and integral theory.

Introduction

Developing models for sustainable organizational change has been a challenging task for organizational scholars. In the article, "Changing Others Through Changing Ourselves" (Quinn, Spreitzer, & Brown, 2000), the authors note that most change efforts in organizations fail, and conclude that this failure is due to incomplete theories of change. They assert that successful change requires change to the human system. In order for such change to occur, the people involved must often endure hardship by letting go of what is familiar in order to permit a new order to emerge within the system. They note that, "This process usually requires the surrender of personal control, the toleration of uncertainty, and the development of a new culture at the collective level and a new self at the individual level. In adaptive change, traditional change strategies are "not likely to be effective" (p. 147). The authors respond to this challenge by laying out a model they call Advanced Change Theory (ACT). At the core of this theory is the principle that "changing others requires changing ourselves first" (p 148). In the article, the authors contrast ACT to traditional theories of change, define the ten basic principles of the ACT model, provide examples of the application of ACT principles to facilitate change in five scenarios of increasing complexity, and conclude by rebutting some possible criticisms to the model.

The Need for a New Change Model

Their article begins with an overview of three traditional categorizations of change strategies: empirical-rational strategy, power-coercive strategy, and normative-reeducative strategy. The empirical-rational strategy presupposes that people are essentially guided by reason, and that people will respond by explaining the logic and benefits for change. The authors criticize this strategy for its failure to embrace the affective and normative aspects of human systems, noting that while people may understand the reasons for change, they may not be willing to go through the emotional pain necessary to adopt them.

The power-coercive strategy emphasizes the authority structures within an organization that can require change on threat of sanctions (e.g., loss of job) for non-compliance. This approach essentially forces compliance on the employees within the organization; however, that compliance often falls short of true change. The authors note that in adaptive change, “people must commit themselves to the collective purpose. The power-coercive strategy usually evokes anger, resistance, and damage to the fundamental relationships of those involved…” (p.149).

The normative-reeducative strategy assumes people are rationally minded and need to be engaged in the process of change. This process involves honest communication and dialog between leaders and followers, where leaders work to build consensus and resolve conflicts. The authors note that of the three traditional views, the latter is the most likely to achieve adaptive change as it engages participants in working toward win-win solutions. However, the focus of this model remains centered on changing the behavior of the followers, and the authors do not view it as comprehensive as the ACT strategy, which can embrace aspects of the traditional models while profoundly changing the way leaders initiate the change process – by changing themselves.

Overview of Advanced Change Theory (ACT)

To explain the ten principles of ACT, the authors draw on the lives of Gandhi, Jesus, and Martin Luther King, Jr. as examples of leaders who embodied these principles in their lives and teachings. These principles are based on two underlying assumptions: (a) change requires making painful adjustments to one’s behavior; and (b) change requires placing oneself in jeopardy – taking risks that put the common good above self-preservation. So, to paraphrase Gandhi and Jesus, the practitioner of ACT seeks to “be the change you want to see in the world” by “dying to self.” Table 1 provides an overview of the ten ACT principles, core questions I composed that a practitioner might ask to evaluate alignment with the principle, and my summary of the purpose of the principle.

In this exposition of the ten principles, the ACT model itself is holistic insofar as each principle builds upon the others. The first six principles focus on the internal states and mindset of the leader – how the ACT practitioner aligns with a future vision. The last four principles focus on the internal states and attitudes of the leader in relationship to others. The ACT principles expand on the core belief that the leader is able to facilitate change by choosing to change his or her own behavior. By doing so, the leader establishes credibility and models the way for others to follow.

Having laid out the principles, the authors acknowledge that using the examples of Jesus, Gandhi, and King as models of ACT could raise concerns that such models are too removed from the challenges of daily life. The authors proceed to provide five real life examples where the principles were applied in increasing levels of organizational complexity (from individual to small group, to corporate department and division, and finally the enterprise). A summary of

Table 1. Principles of Advanced Change Theory (ACT)

Principle	Core Question	Practitioner Summary of Focus
1. Seeks to create an emergent system	Am I aware of the realities of emergent system?	Focus on creating a new social reality; builds community of inclusion while minimizing hierarchy; enrolls participants in making painful behavior changes away from self interest.
2. Recognizes hypocrisy and patterns of self-deception	What are my patterns of self-deception?	Seek to align works and actions, focusing on common good over self interest. Continuously seeks to improve integrity; honest self-assessment, open to feedback; personal discipline to change behaviors that are not aligned.
3. Personal change to value clarification and alignment of behaviors	Are my values and behaviors aligned?	Develops confidence in willingness and ability to "discard inaccurate assumptions in the midst of ongoing action" (p. 151).
4. Frees oneself from the system of external sanctions	Am I free from external sanctions?	Is willing to put oneself in jeopardy of hardship for the sake of doing the right thing. Does not operate from a position of fear.
5. Develops a vision for the common good	Do I have a vision of the common good?	Engages a compelling vision of the future; is open to consider possibilities that are emerging that would best serve the common good
6. Take action to the edge of chaos	Do I operate at the edge of chaos?	"Operating on the edge of chaos means leaving the well-structured world of known cause and effect and enacting a new order" (p.153). A willingness to stretch "by faith" beyond the bounds of what is familiar.
7. Maintains reverence for the others involved in change	Do I maintain reverence for others?	Respects the freedom and dignity of others. Has the faith that others will embrace the moral goodness of the change to the level they are able.
8. Inspires others to enact their best selves	Do I inspire others to enact their best self?	Holds others to a high standard; models the way in behavior. Attracts others by focusing on their highest potential self.
9. Models counterintuitive, paradoxical behavior	Am I engaging in unconventional or paradoxical ways?	Appreciates complexity of change; willing to engage in behavior that reframe meaning.
10. Changes self and system	Have I changed myself as a model for the system to change?	Seeks to change personal attitudes and behavior as a means to challenge the system and enact change.

these cases is presented in Table 2. In each situation, a participant within the group experienced an inner change and in bringing that change to the group was able to facilitate transformation in the group as a whole. What is significant in this model is that the individual in question may not have been in an "official" position of authority/leadership when he or she facilitated the change. In fact, the situation required the "change agents" to confront a personal crisis, and in doing so to make conscious decisions to change their personal behavior. It was their willingness to change and share that change with the group that enabled the transformation. The authors review the cases from the vantage point of the ten principles, positing the questions that the practitioners wrestled with in each scenario (see Table 1).

Finally, the article concludes with a rebuttal to possible criticisms to the ACT model, which may be summarized as follows.

1. ACT will fail as it is not equipped to deal with real world treachery.
2. Gandhi, Jesus, and King were flawed and not appropriate models.
3. Gandhi, Jesus, and King were heroes and difficult to emulate.
4. ACT has only limited application.

In addressing these criticisms the authors observe that each criticism focuses on the traditional transactional approach to leading change. By contrast, the ACT model is focused on co-creating an emergent reality. In this regard, it is a more dynamic and relational approach to leading change.

Observations & Opportunities

The authors presented Advanced Change Theory as a new way to approach the process of leading change. While their case was well researched and documented, both by reference to other academic studies and examples drawn from the lives of Jesus, Gandhi, and King, their article was not intended to be a review of qualitative or quantitative test results. The authors note that, "these notions are speculative, not definitive, and our intention is to provoke ideas and thinking regarding the process of effecting change in human systems" (p.148).

While their presentation may be speculative, there is corroborating support for this approach across a spectrum of recognized thought leaders on leadership. In his book, *Good to Great* (2001), Jim Collins describes Level 5 leadership as an individual not of strong charismatic personality, but one who holds that sense of purpose to serve the common good above personal gain. Kouzes and Posner (1993) likewise note that the credibility of a leader is built upon his or her character: a willingness to define and live personal values, and strive for a higher purpose that appreciates the diversity and role of constituents in shaping the future. ACT also draws heavily on the recent trend to apply complexity theory to the task of leadership and change. The authors note that failure to change is often due to the lack of appreciation for the complexity of human systems. Current literature supports the need to address the complexity of contemporary systems, emphasizing the role of leadership in creating the environment for emergent realities to unfold (Uhl-Bien, Marion, & McKelvey, 2007; Scharmer, 2007).

What I find of particular interest in ACT is its implications for developmental and integral theory. Considering the developmental work of Kegan (1982, 1998), the ten principles of ACT suggest that the ACT practitioner is an individual operating at a high level of cognitive development. Similarly in Torbert's (2004) model of action-logics, the ACT practitioner would operate at the Strategist or Alchemist stages based on the ability to be self-reflexively aware and the willingness to put self in jeopardy for the sake of the greater good. Likewise, Putz and Raynor (2004, as cited in Reams, 2005) note the integral leader as being more adaptive to change without threat to personal identity, a clear description of the ACT practitioner. ACT thus

Table 2. Summary of Case Studies

Level	Situation	Personal Change
Mother-Daughter Relationship	Mother assisting daughter with homework realizes that she is outwardly encouraging her daughter and yet inwardly distrustful. Mother stops micro-managing the relationship, encouraging daughter to come for help when needed. Daughter feels more trusted, school performance improves and a more loving relationship develops between mother and daughter.	Awareness of mixed messages leads to decision to change attitude and behavior towards daughter.
Changing a class	A student who had been quiet and unassertive in class takes a risk by sharing his personal experience. His behavior leads others to feel safe to share from their own experience, and transforms the classroom environment. A new openness emerged and the students and teacher engaged in dialogue that moved away from traditional teaching methods to a co-created learning experience.	Taking risk to be open and vulnerable set the frame for others to do the same.
Changing a business unit	After an employee committed suicide during a downsizing effort, a middle-manager came to a wrenching personal decision to stop playing office politics and tell employees the complete truth. Surprised that he was not fired for his commitment, the manager went on to see a dramatic transformation in his business unit as his change in attitude kindled trust and willingness of his employees to embrace change.	A crisis led to the decision to be completely truthful with associates. The response to his behavior was increased trust and openness within the business unit.
Changing a division	A senior executive of a division of a large company was fearful of losing his job after the company engaged in three downsizings. After months of anguish, he “concluded that he had an identity separate from the organization… and stopped worrying about the dangers of change…He began to ask himself what was needed in the present” (p.157). The executive met with other key employees and invited them to reenvision the future of the division.	Confronting his personal fears about job loss permitted the executive to shift his focus to the betterment of the organization, and invite others to do the same.
Changing a corporation	After 5 years, the CEO of a Fortune 500 company realized that the complexity of the organization made it impossible to mandate change. “As we became more complex and the environment more intense, it became impossible to get things done through the force of leadership…I realized I had to get everyone engaged and committed” (p.158). The CEO invited 3 financial analysts to present honest criticism of the company to the top 120 executives. Widespread conflict arose among the participants and the CEO gave the executive team 2 days to discuss the tensions. What emerged was a new “meaning system” and renewed sense of commitment.	Realization of his lack of personal power in the face of organizational complexity, the CEO chose to confront that complexity and engage his executive team to do the same even in the face of conflict.

paints a vivid picture of some profound characteristics of the high functioning, post-postmodern leader. This is an individual who chooses to act from an internal space of increasing integrity to his own values and beliefs, while being able to suspend those beliefs and engage the current context with an openness to evaluate new and emerging patterns, an individual who can then construct new meaning for the context, and be self-directed to change her own behavior to lead others to embrace the emerging future, setting aside personal interest for the benefit of the common good.

The ACT practitioner's willingness to choose a course of action that may require personal sacrifice also draws on an important distinction in integral theory, namely that stages of personal development occur across multiple lines of human nature. From this vantage point, human beings develop at different rates along such lines as intellectual, emotional, moral, ethical, relational, and spiritual development. With this in mind, ACT suggests that the practitioner may need to achieve advanced stages along multiple lines of development to be effective, particularly in terms of cognitive and moral/ethical development. In fact, the ten principles of ACT appear to merge the cognitive, relational and moral/spiritual lines of development into an integrated stream of consciousness that is both aware of self and others, and committed to act according to a higher purpose.

Taking in the implications of adult development could lead one to dismiss ACT as impossible to implement, given the general knowledge in that field of study that there are very few individuals operating at advanced developmental stages. However, a quick review of the case studies suggests a different spin on the notion of adult development that serves as a personal attractor to the model as both viable and timely. In each case, the ACT practitioner confronted a personal crisis and overcame it by making a decision that resulted in a shift in their behavior *in a specific context*. There is no claim here that the individuals *always* operate at a higher developmental level in *every* context; only, that the crisis-decision process resulted in behavior that could be described as being at a higher developmental stage in the context in which it occurred. I believe that ACT provides a model by which individuals are engaged to confront a contextualized aspect of their personal development and by so doing, are able to produce generative impacts on those around them. In this, ACT may represent a stepped model of adult development, whereby the individual encounters crises that require resolution of a subject-object conflict.[1] Each resolution expands the individual's internal map of the world in which they operate.

From the perspective of contextualized personal development, the implications of ACT can be quite profound. Every crisis I encounter can be an opportunity for self discovery and personal growth, requiring honest reflection and a commitment to personal integrity. Further, the ACT model suggests that my decision for personal growth does not simply impact *me*. Choosing to act in a more developmentally mature, resourceful and integrative way—as a better version of my self—will ultimately impact and self-organize the behavior of the system (i.e., context) of which I am a part.

---

[1] This crisis-decision-behavior change process may in fact be an archetype of developmental change implicitly modeled in literature and the arts. How many stories reflect this very conflict and the outcome – for better or worse – of the protagonist's success or failure in overcoming the crisis?

While the article provides a working overview of ACT and how it might be applied in everyday contexts, there are two issues that could be addressed more thoroughly. First, the authors describe the ACT practitioner as being open to embrace paradoxical or counterintuitive behavior (case in point, King refusing to engage a security guard after a threat on his life, choosing to live his value of non-violence at the risk of his personal safety). There could have been further explication of the role of paradox in the ACT model and human systems. This topic is in fact explored further in more recent work by the principal author (Quinn, 2004) and is noted by Reams (2005) as an aspect of integral theory, particularly as it relates to the transpersonal dimensions of consciousness. Second, the authors chose not to address the implications of spirituality to ACT. They note that, "rather than focusing on the specific religious focus of these leaders, we instead focus on the philosophy and actions commonly demonstrated in their attempts to embrace adaptive change" (p. 150). Spirituality as a basis for personal values and understanding of emergent (non-material) realities could provide further insights into the actions of the leaders they selected to exemplify the ACT approach. Likewise, it is consistent with contemporary applications of integral theory to the study of leadership, which seeks to take a holistic view of human systems (Reams, 2005; Putz, 2006).

As a model for change, ACT is compelling and humbling, intensifying the importance of personal responsibility and commitment required for achieving change. ACT also presents a dynamic model for context-specific adult developmental change. To embrace the model is to throw out excuses about existing power structures and external influences that would hinder action. ACT practitioners are driven by a sense of fulfilling a higher purpose and are willing to make sacrifices (and often the ultimate sacrifice as was the case for Jesus, Gandhi, and King) in the context in which they seek to accomplish their objectives. To embrace ACT requires willingness to confront one's personal conflicts, resolve one's own lack of integrity and choose to live a life of personal development and growth.

Book Review

Leadership Ethics: An Introduction.

Price, Terry. 2008. Cambridge MA: Cambridge University Press

Reviewed by **Nathan Harter**

Students of leadership – and especially of leadership ethics – have noticed the increasing importance of the philosopher Terry Price, who teaches at the Jepson School of Leadership Studies at the University of Richmond, Virginia. In 2005, he published *Understanding Ethical Failures in Leadership*, a volume in the Cambridge Studies in Philosophy and Public Policy. Recently, he produced an accessible and inexpensive introduction to leadership ethics that is as philosophically credible as his earlier work. The book, published by the Cambridge University Press in 2008, goes by the title of *Leadership Ethics: An Introduction*.

Price's contribution is a penetrating look at justifications for leaders to break the moral rules. What he does is make what lawyers call the *prima facie* case that there are indeed moral rules. At that point, the burden then shifts to the person hoping to justify a leader's behavior in apparent violation of these moral rules. (Price frequently uses lying or the breaking of promises as typical examples.) The book lists likely arguments attempting to justify these behaviors, and Price's treatment is altogether fair to each argument before explaining why they ultimately fail. Thus, the book concludes that ordinary leaders in everyday circumstances cannot justify violating the moral rules; if anything they have a *higher* duty to observe the moral rules.

One can detect a grudging acknowledgement at times in this book that extraordinary circumstances might be enough to justify breaking some moral rules, but Price is careful to hedge these around with caution and warn readers not to think their circumstances are all that dire. Most of us do not face homicidal evil and devastation. As his studies with psychologist Crystal Hoyt demonstrate, leaders and their followers are far too likely to think of their cause as extraordinary when in fact they are simply pursuing the same goods and welfare that most folks are pursuing every day of the week.

One could call into question the Kantian ethics on which the book is based. One could dispute whether there really are moral rules, for example, or whether anyone can know for sure in a given situation what they are. One could join Soren Kierkegaard in taking a position in favor of what has been called the Teleological Suspension of the Ethical, just as Abraham was commanded by YHWH to slay his own son. Abraham knew this was morally wrong, but he relented. Alternatively, one could join Max Scheler, the twentieth century phenomenologist, who alleged that ethics is less about rules and more about imitating the values embodied in extraordinary lives, persons whom Scheler called Exemplars.

In response to these lines of critique, let it be said that Professor Price did not set out to defend Kantian ethics. His purpose was to address the real world predicament when leaders justify breaking the moral rules they acknowledge would be binding on everyone else. How does

SOME RIGHTS RESERVED

one resolve the apparent contradiction? The book considers claims surrounding the specialness of the person who is the leader, the specialness of the role of leader, the specialness of the particular circumstances, and so forth. In the course of doing so, Price exposes the reader to popular ethical theories such as utilitarianism, communitarianism, and virtue ethics.

Rather than attempt to refute the book's conclusion, I would rather raise questions in order to see how the argument cuts. In a fashion typical of philosophers, I would use extreme situations to test just how far one can go in defense of the moral rules. One might wish to adhere to the moral rules at all times, yet the pressures of leadership affect one's judgment.

Take for instance the domestic terror undertaken by John Brown on behalf of abolition in the United States during the mid-1800's. He led a small band of insurrectionists for the sake of an ideal shared by many persons today, yet he engaged in gruesome, belligerent acts. I suppose Kant would say the ends were noble, though the means were ignoble, yet Abraham Lincoln and his military commanders chose violence on a larger scale, including unprecedented savagery during General Sherman's so-called March to the Sea. Today, those men are considered heroes for the cause of emancipation.

Another puzzle. Partly due to his elite training and patrician demeanor, Alger Hiss rose to a position in the U.S. government of considerable importance during the first half of the twentieth century, yet the evidence shows that he was a spy for a foreign power.[1] Suppose Hiss had not taken the position that he was innocent. Suppose instead he had protested that a higher moral duty to the workers of the world demanded that he commit treason against his country. How would that fit Kantian ethics? The reason I ask is that plenty of leaders derive their authority from moral claims of this sort. And Price even writes that "morality may require the sacrifice of group goals."

Looking back, today's reader might take for granted the culpability of a John Brown or an Alger Hiss, yet at the time they lived, there was considerable disagreement about what exactly was right and wrong. It is not always clear what the moral rules dictate. Often, it is precisely because leaders dispel the moral confusion for their followers that leadership occurs.

Of particular interest to me was the book's treatment of consent as a justification. Parties to a contract consent to all sorts of things they were not obliged to undergo. They relent in exchange for some consideration in return. Once concluded, the contract embodies a promise, and as we all know there is a moral rule against breaking one's promise. The odd thing is that lawyers anticipate breach. They include provisions within the terms of the contract in the event one party or the other fails to perform. When breach occurs, the party in breach must do something or other to make the aggrieved party whole. In other words, the parties consent to having their promises broken so long as everyone's interests are accommodated. Capitalism itself would not work without this feature.

President Lincoln, having practiced law before entering politics, understood this. He understood that sometimes you have to renege. Carl Sandburg (1954) quoted him as saying in a speech, late in his presidency, that, “as bad promises are better broken than kept, I shall treat this [a particular deal he had made for Louisiana’s return to the Union] as a bad promise, and break it, whenever I shall be convinced that keeping it is adverse to the public interest.” The irony of this position, of course, is that the representatives of the states in secession held to a similar position when they withdrew from the compact that led to the Constitution of the United States. They were in breach.

---

[1] The guilt or innocence of Alger Hiss has been debated for decades. See, for example, Klehr (2004); *contra* Lowenthal (2000).

One could quarrel about the relative merits of bygone disputations in the nineteenth century, but the question remains whether consent on the part of followers justifies a leader in breaking the moral rules they all acknowledge. How often do followers excuse being lied to, even misdemeanors in office? It might offend our sensibilities, looking from the outside in, yet we could also let the parties negotiate these things for themselves – at least up to the point at which the leader’s behavior starts to imperil consent itself.

Leadership Ethics: An Introduction has many such “jumping off points” for classroom discussion. For this reason and more, one can conclude that Terry Price has written a book that could serve as an introduction to leadership ethics at the graduate level, even though it does not fit everyone’s paradigm for a classroom textbook. It contains no study aids. It is by no means neutral on the question it raises. And it offers no formula or recipe for becoming an ethical leader. But then, as the smart aleck once observed, “Philosophy books can’t be any good, since the answers aren’t in the back.” Instead, *Leadership Ethics* is a deliberate work that is fair to alternate theories and invites the student to contemplate strenuously the ethics implications of leadership.

Book Review

The Bridge at the Edge of the World: Capitalism, the Environment, and Crossing from Crisis to Sustainability

Speth, James Gustav. 2008. New Haven, CT: Yale University Press

Review by **Jan Inglis**

This book is a comprehensive analysis of the challenges and hopes that lie amidst the interconnections of the environmental movement, the growth economy, consciousness, and democracy. Author "Gus" Speth is former administrator of the United Nations Development Programme, founder of both the World Resources Institute and the Natural Resources Defence Council, and currently Dean of Forestry and Environmental Studies at Yale University. In his earlier book, *Red Sky at Morning,* Speth focused on global environmental threats and international responses. By contrast, in this book he considers underlying structures of issues and solutions at more local and national scales. Although written from an American perspective the observations and conclusions appear transferable to a broad audience.

In reading this book I appreciated his vulnerability in detailing the enormity of the challenges we are dealing with, while at the same time stepping off his well-deserved expert's podium, stating he did not have any easy answers to offer. I resonated with his naming of the resistance that arises when even talking of such things.

> It is easy to push these challenges out of one's mind. Life for many of us is comfortable, and dwelling on such disturbing material is painful. Indeed, one still hears with regularity that it is a mistake to stress these gloomy and doomy realities if one wants to motivate people. In *The Death of Environmentalism*, Michael Schellenberger and Ted Nordhaus remind us, for example, that Martin Luther King, Jr., did not proclaim, "I have a nightmare." My reply to them was that he did not need to say it — his people were living a nightmare. They needed a dream. But we, I fear, are living a dream. We need to be reminded of the nightmare ahead. Here is the truth as I see it: we will never do the things that are needed unless we know the full extent of our predicament. (p. 234)

Speth not only names our entwined environmental, economic, social, and political predicament, but also describes how this predicament was built and is maintained. He attempts to help us step outside of the system, or systems, in order to adequately critique the complex interlocking nature of their dysfunctional patterns. Having surfaced these challenges, the book leads us into his and others' insights into dismantling them and building something new. Details of this new story, or dream, which can be created only after the nightmare has been acknowledged, make up the last part of the book.

In Part One, Systems Failure, Speth describes the abyss we are facing: climate disruption, loss of forests, land, freshwater, marine fisheries, and biodiversity. He talks of a growth economy that lacks self-reflective and self-correcting capacities and is therefore on a collision course with

SOME RIGHTS RESERVED

the environment and species sustainability. He digs deep into the root causes of how this collision has been created and politically entrenched, analyzing the structures of capitalism. He goes on to analyze why the environmental movement, although successful in many ways, has failed to produce effective action. He concludes that this resulted from working within a system without the benefit, in my words, of being able to bump up the perspective in order to create a metavision adequate to transform the systems within systems.

In Part Two, The Great Transformation, Speth uses specific examples to outline what it would take to shift markets, pricing, corporate dynamics and our preoccupation with growth towards something more sustainable. He lays out how a functional relationship could occur between government regulations, entrepreneurial new technologies, public values and a new form of green economy. Instead of just the GNP, the health of people and nature could finally be placed as a significant indicator on a national barometer of well being. He unpacks our addiction to consumerism and desire for happiness, examining what has allowed us to merge the two. This reveals a cultural blind spot since research has repeatedly proven that beyond a certain point an increase in earning and spending does not correlate with an increase in the satisfactions of life.

In Part Three, Seedbeds of Transformation, two drivers of transformative change are offered: a new consciousness and a new politics. Speth indicates that underlying the necessary changes to public policy and behaviours lies the requisite changes in values, worldviews and ways of relating. He advocates for a new environmental politics for transforming capitalism, consumerism, and social inequities, which would include increased participation through deliberative democracy.

For someone like myself, feeling compelled to learn more about responses to the climate crisis but being overwhelmed by the abundance of books and articles available, Speth provides a high quality one-stop shopping experience. Not just tapping into his own experience and viewpoints, he also is prolific in quoting and integrating many other experts in many fields such as Milton Friedman, Paul Hawken, Herman Daly, Max Weber, Donnella Meadows, Paul Ehrlich, Howard Gardner, Peter Senge, and Bill Moyer, to name just a familiar few. He does not attempt to find quick easy solutions to that which is very complex. He does, however, move beyond the propensity of many other authors who stop short at proclaiming vague and often unexamined prescriptions of what we “should” do. Although indicating that he too was once part of the “us and them” framework that has coloured the environment versus economics battle for years, his writing has clearly transcended this structure of thinking.

Speth’s language and field of work do not reflect the usual parlance of the integral and developmental world. However, to me this book indicates his inherent recognition of the need to work with the many factors necessary to understand and adequately work with the whole. He includes some reflections on the changes and natural progressions he has noted not only in himself over time but also in the environmental and economic systems. These understandings frame his projections of what steps are needed for a sustainable future. The observations in the book include analysis, and comparisons of the structures, limitations and interactions of several metasystems and in hierarchical complexity terms indicate a paradigmatic stage of performance.[1]

---

[1] Commons, M. L. & Ross, S. N. (2008). What postformal thought is, and why it matters. *World Futures: The Journal of General Evolution, 64*(5-7), 321-329.

There is also anticipation, although not quite creation, of a new field that could coordinate a new political, ecological, and economic paradigm. I can project scenarios of what might happen if these considerations were combined with those of developmentalists such as Bill Torbert in his use of action inquiry to transform power and politics, and Sara Ross in her research of integral approaches to respond to complex public issues. This could make for one awesome cross paradigmatic, world influencing, new field and new approach to 21st century issues!

Several times, Speth mentions that the impetus for breaking the gridlock that consumerism and capitalism has on the environmental movement and our consciousness might require some form of dramatic collapse. The multifaceted recipe he lays out is:

> …a calamity or breakdown (or, ideally, the public anticipation of one brought on by many warnings and much evidence), occurring in the presence of wise leadership and a new narrative that helps make sense of it all and provide a positive vision, urged on by a demanding citizens' movement that fuses social and environmental causes, informed and broadened by well-conceived social marketing campaigns, joined by a contagious proliferation of real-world examples that point the way. (p. 215)

This book was published early in 2008, several months before the economic collapse and American election. These recent occurrences therefore beg for an epilogue as there is, for me, this tantalizing question left hanging: Does Speth think that this is the collapse and the new leadership that will stimulate a new consciousness, a new politics, and a bridge to a new world?

Jan Inglis *has written for Integral Review, specifically in the area of climate crisis. She specializes in developmental and integral approaches to complex social issues. Editorial

As I reflect on them, I find the topics addressed in both sections of this issue are truly inspiring, in their breadth and their creators' motivations for offering them. Consistent with IR's purpose as a forum for new thought, research, and praxis, the theme of the peer reviewed section is the advancement of fields of study and their applications. This theme takes shape as articles lay foundations for advancing the application of developmental psychology through more rigorous standards, break new pedagogical ground in the use of intersubjective forms of contemplative practice, and reposition phenomenology within integral theorizing and in its own field. In the section of editorially reviewed works, the span continues to range over diverse horizons. Those horizons offer a way to understand the added value an integral approach offers education and what sets it apart from other progressive educational practices, an interview with a pioneer in the evolutionary consciousness movement, artistic creations inspired by three of the texts in this issue, a book review, and a report from the field using recently published praxis, and finally a tour through the history of transcendence and its profound influence on some of the icons of Western culture. This whirlwind scan of the contents of this issue shows the power and broad ranging influence that integral thought is able to take.

We begin this issue with Zak Stein and Katie Heikkinen's *Models, Metrics, and Measurement in Developmental Psychology*. This article addresses growing concerns about quality issues in the application of developmental psychology. To unpack the dimensions involved, the authors distinguish between developmental models (explanatory or descriptive) and metrics (calibrated or soft measures) and the quality-control parameters of validity and reliability. They also relate models and metrics to different types of quality-control devices, and reveal why there is a need for more rigor in the field. We believe this article lays a solid foundation for continuing the discussion about how the field of developmental psychology might ensure that researchers and practitioners advance the application of developmental psychology in our world with consciously-deployed levels of quality. The authors and *Integral Review* invite responses to this article to carry forward the conversation.

Next, Olen Gunnlaugson contributes *Establishing Second-Person Forms of Contemplative Education: An Inquiry into Four Conceptions of Intersubjectivity*. This work is part of Gunnlaugson's doctoral research into the growing field of contemplative education practices. He delves into the works of Martin Buber, Thich Nhat Hahn, Christian De Quincey and Ken Wilber to show how the contribution of each can deepen our understanding of intersubjectivity. From there he shows how this understanding can add a neglected dimension to contemplative educational practices, the domain of second person forms of education. His work opens up a previously neglected field of inquiry, offering new spaces for future research and practice.

In our third peer reviewed article, Wendelin Küpers' *The Status and Relevance of Phenomenology for Integral Research: Or Why Phenomenology is More and Different than an "Upper Left" or "Zone #1" Affair* combines an overview of phenomenology with a critical examination of the current status the field is assigned within the AQAL model of Wilber. This examination presents a view that challenges the prevailing perception of phenomenology within the Wilber-oriented integral community. In addition, Küpers shows how the more advanced

SOME RIGHTS RESERVED

phenomenology of Merleau-Ponty embodies a proto-integral perspective and proposes an “adequate phenomenology” for integral research, or an integral “pheno-practice.” The depth and scope of this work makes a significant contribution to integral understandings of phenomenology, as well as bringing something new to the field of phenomenology itself.

Opening our editorially reviewed section, Tom Murray has turned his attention to *What is the Integral in Integral Education? From Progressive Pedagogy to Integral Pedagogy*. The field of education is rife with reforms, alternative, progressive and now even integral approaches. But in reality, what actually sets *integral* apart from this crowd? Or are integral approaches to education simply the new fad for dressing up progressive pedagogies? Murray addresses these questions with a nuanced yet clear description of the main features of progressive pedagogies and indicates how this reveals both overlap and distinctiveness in relation to integral approaches. To help distinguish what *integral* adds to existing pedagogies, he shows how it functions as a model, a method, a community, and a developmental stage.

Next, Russ Volckmann’s *Interview with Barbara Marx Hubbard* takes us through a fascinating conversation that roams over highlights of Hubbard’s career in creating new kinds of politics, her involvement with the Club of Rome, evolutionary trends and how she has applied her ideas in creating synergistic spaces for emergent processes and structures. Her high energy and ongoing engagement with life shines through in this wonderful interview.

Inspired in part by the above interview, Amy Leung and Andrew Campbell, our Arts and Creativity Editor, contribute *So I was Playing With Brushes on the Back of My Hand*. This series of artistic creations is interspersed with text from three of this issues’ articles, (Volckmann’s interview, and the Gunnlaugson and Currie articles). The juxtaposition of these excerpts with the visual art opens up spaces for the contemplation of those texts in a new way.

We then have Jan Inglis, a regular contributor to IR, reviewing *Integral Ecology: Uniting Multiple Perspectives on the Natural World* by Sean Esbjorn-Hargens and Michael Zimmerman. In addition to offering a high-level overview of the structure and contents, Inglis articulates some critiques of some of the book’s treatments. These include the emphasis on interiority, the relation of integral theory to Wilber and how much the book is possibly constrained by the positions taken, the question of what is research in this field and how it could be applied. Her review gives us a feel for the book, the issues it raises, and some of the struggles the authors might face as they aim to plant a stake in this ecological territory. Here also we invite responses.

My own contribution is *Immunity to Change: A Report From the Field*, which describes the recently published work of Robert Kegan and Lisa Laskow Lahey, *Immunity to Change. How to Overcome it and Unlock the Potential in Yourself and Your Organization*. In addition to a summary of the book, I present my experience with applying their work in two contexts. This includes some reflections on how the process described in the book unfolds in practice, and how the book can support work that can truly make a difference for individuals and organizations.

Finally, we close this issue with *Paranada: Beyond Beyond* by Hector Currie with Juan Pacheco. This essay is the culmination of Currie’s lifelong passion for how the notion of transcendence has woven its way from ancient India through Greece and on into the arts and sciences. In particular, this passion has been fueled by his research findings of geometric evidence for how the concept of a transcendent kosmos is realized in the Pythagorean design of the temple and theatre complex of the ancient Greek Temple of Delphi. After detailing the nature of this discovery, the thread of transcendence is followed through examples in both literature and modern science, leading to a call for the transcendence of differences to allow for tolerance.

All of us here at *Integral Review* hope that you enjoy this issue as much as we have enjoyed the process of putting it together.

Sincerely,

JReams

Models, Metrics, and Measurement in Developmental Psychology

Zachary Stein and Katie Heikkinen

Abstract: Developmental psychology is currently used to measure psychological phenomena and by some, to re-design communities. While we generally support these uses, we are concerned about quality control standards guiding the production of usable knowledge in the discipline. In order to address these issues precisely, we provide an overview of the discipline's various facets. We distinguish between *developmental models* and *developmental metrics* and relate each to different types of quality-control devices. In our view, models are either *explanatory* or *descriptive*, and their quality is evaluated in terms of specific types of disciplinary discourse. Metrics are either *calibrated measures* or *soft measures*, and their quality is evaluated in terms of specific psychometric parameters. Following a discussion on how developmentalists make metrics, and on a variety of metrics that have been made, we discuss the two key psychometric quality-control parameters, *validity* and *reliability*. This sets the stage for a limited and exploratory literature review concerning the quality of a set of existing metrics. We reveal a conspicuous lack of psychometric rigor on the part of some of the most popular developmental approaches and invite remedies for this situation.

Keywords: developmental assessment, developmental psychology, epistemology, meta-theory, psychological technologies, psychometrics, quality control, usable knowledge.

Introduction: Concern Over the Measuring of Psychological Phenomena

The marketplace of ideas is rife with various instruments, measures, and techniques designed to gear into the psychological lives of individuals and the lifeworlds of communities—from Spiral Dynamics to Requisite Organization, Integral Life Practice, and a multitude of leadership initiatives. But what are the standards that should determine which of these psychological technologies should go to market? And what of the psychological technologies to come? What are the quality-control parameters for this kind of knowledge production? These are the concerns that guide this paper. We provide an overview of the discipline's various facets in an attempt to clarify our call for quality control efforts, and guide their execution. This is the second of two papers about exercising quality control over the production of *usable knowledge* in the discipline (see Stein, 2008a). We are not the only ones worried about the market cultures consuming psychological technologies manufactured by the discipline (see Ross, 2008) and we hope to contribute to the conversation by introducing key theoretical and methodological distinctions.

More specifically, the heart of the concerns we raise here are *psychometrical*. Psychometrics is a branch of metrology, which is the transdisciplinary study of metrics. As the term implies, psychometricians are specifically concerned about measuring psychological phenomena. As explained below, developmental psychologists build *models* and *metrics*, seeking both to understand the development of psychological phenomena, and to measure them. Developmental

SOME RIGHTS RESERVED

metrics—often called scoring systems—deserve attention because they are situated near the heart of the discipline, and radically shape both research and practice.

Below, we provide an overview of developmental psychology as a discipline, presenting a map representing its different important aspects. We then discuss this map, paying particular attention to methods for building developmental metrics. This sets the stage for a limited, exploratory literature review covering a set of metrics currently in use. According to our review, the literature reveals a conspicuous lack of psychometric rigor on the part of some developmental approaches. Generally, this paper is an invitation to the community to remedy this situation, and begin more a serious discourse about quality control in the field.

Models and Metrics in Developmental Psychology

To start, we will situate some of our key terms. Table 1 below displays four example disciplines, along with their *metrics, models,* and *technologies*. The distinctions we suggest—e.g., between *metrics* and *models*—are discipline-general distinctions. In other words, they are meta-theoretical distinctions, insofar as they *oversee* and *explicate* discipline-specific distinctions. Thus our concerns about *technologies* are also meta-theoretical. The question of how general and useful these distinctions are is not a question we will address in the context of this paper. Do all sciences have some variety of metric, model, and technology? It seems so from what we can see, but this paper will focus solely on developmental psychology. These distinctions are certainly relevant to developmental psychology and the issues immediately at hand. We discuss how to use these distinctions—and a host of others—to institute quality control standards for the production of usable knowledge in the field.

Table 1. Knowledge Production in Selected Disciplines

Discipline	Metrics	Models	Examples of Technologies
Developmental psychology	Psychometrically calibrated	Disciplined discourse about developmental *models*	*Psychological technologies* for education
Medicine	Biometrically calibrated	Disciplined discourse about *models* of disease	*Medical technologies* for healing
Sociology	Sociometriclly calibrated	Disciplined discourse about *models* of social life	*Social technologies* for group transformation
Economics	Econometrically calibrated	Disciplined discourse about economic *models*	*Financial technologies* for market amelioration.

Figure 1 zooms in on the first row of Table 1 to reveal more detail about developmental psychology. As discussed below, *metrics* and *models* are further characterized as *representational devices*, both with subtypes. Figure 1 relates metrics and models to their respective quality-control devices. *Technologies* are not represented because they require their own separate map; an interesting map that nonetheless will not be rendered here. Importantly, according to our view, in developmental psychology *metrics* and *models* set the conditions for the possibility for *psychological technologies*. The two-way arrows—both horizontal and vertical—signify the complex inter-animations and relations between the various areas differentiated in the map. Metrics, models, and their respective quality control devices inter-participate in dynamic ways, especially during the generation of usable knowledge and the building of psychological technologies. However, these complexities are beyond the scope of this initial treatment of the issues. Nevertheless, despite neglecting some important topics, this paper should still be viewed as a critical meta-theory for guiding the production of future psychological technologies brokered by developmental psychologists.

Figure 1. A Meta-theoretical Explication and Representation of Knowledge Production Processes in Developmental Psychology

The distinctions and relations displayed in the map above are based on a broad survey of comparable meta-theoretical projects concerning the epistemological workings of psychology as a discipline. Most useful in this respect are the following: Piaget's (1970a, 1970b, 1970c) work on interdisciplinarity in psychology; Habermas's (1988) work on the logic of the social sciences; Donald Campbell's (1959, 1969, 1987) work on an epistemologically relevant social psychology of the disciplines; Overton's (2006, 2007) systems-theoretic meta-theory for developmental psychology; Fischer and Bidell (2006) and Van Geert's (1994) work on model building in developmental psychology; and Dawson (Dawson-Tunik, 2004) and Jaques's (1978) work on metrics in developmental psychology. The fully explicated set of working terms garnered and synthesized from this cast is presented in Figure 2. Once again, we are simply presenting a collection of meta-theoretical distinctions topographically, as a system of related terms and categories. Figure 2 explicates Figure 1 in a slightly different representational modality.

<table>
<tr><th colspan="7">Developmental Psychology</th></tr>
<tr><td rowspan="2">Representational devices: methods, symbol systems, and propositions—built by communities of developmental psychologists—which in some way claim to be <i>about</i> cognitive developmental processes.</td><td colspan="3">Metrics: representational devices built and used to determine the amount of or degree to which a specific psychological trait is found to be in a sample of performances.</td><td colspan="3">Models: representational devices built and used to account for or characterize the presence of a specific psychological trait found in a sample of performances.</td></tr>
<tr><td>Calibrated measures: metrics that adhere to strict quantitative standards for determining the amount of a trait. Mainly for use in measuring individuals.</td><td>Soft measures: metrics with mainly qualitative standards for determining the amount of a trait. Mainly for use in conducting research.</td><td colspan="2">Clinical assessments: judgments and diagnoses rendered by professionals, informed by models and based on clinical experience.</td><td>Explanatory models: models that posit mechanisms or processes to account for the occurrence of the trait.</td><td>Descriptive models: models offering idealized or exemplary characterizations of the trait.</td></tr>
<tr><td rowspan="2">Quality-control devices: methods created by developmental psychologists for selecting between different types of representational devices, e.g., ranking them in terms of their validity.</td><td colspan="3">Psychometrics: research and theory concerning the creation and maintenance of quality-control standards for metrics.</td><td colspan="3">Disciplinary Discourse: critical exchange of evidence and argument concerning the creating and maintenance of quality-control standards for models.</td></tr>
<tr><td>Validity: the focus of psychometric studies about the types of reasonable inferences and claims we can make in light of the results yielded by a metric.</td><td colspan="2">Reliability: the focus of psychometric studies about the performance-quality of metrics, specifically about the degree and type of their error-proneness.</td><td colspan="2">Theoretical: disciplinary discourse about the truth, coherence, and reasonableness of models.</td><td>Practical: disciplinary discourse about the ethics, efficacy, and implications of putting models to use.</td></tr>
</table>

Figure 2. Terms and Definitions about Knowledge Production Processes in Developmental Psychology

Figures 1 and 2 require elaboration. Examples will be useful in clarifying some of the key distinctions. A good place to begin is the work of Erik Erikson (1980), who offers perhaps the most widely known instance of a developmental model *not* tied to a metric. That is, Erikson's *model*—which describes and explains the life course in terms of eight stages of increasing maturity—has no accompanying *metric*. Such a metric would be an explicit procedure for determining the degree of maturity evidenced in an individual's language or actions. So while Erikson offers *descriptions* and *explanations* of development—based on clinical experience, and useful in honing *clinical assessments*—he offers no explicit tools for making measurements or assessments of development. Models inform our understanding insofar as they characterize and account for things, but they don't interface with and disclose the world in the same way as metrics do.

Kohlberg (1981, 1984), on the other hand, had both a *metric* and a *model*. Following Baldwin, Mead, Dewey, and Piaget, Kohlberg offered a model of moral development wherein an individual is socialized into a world of norms and systems of mutual expectation, passing through six stages on the way to a kind of post-conventional moral autonomy. Alongside this model was Kohlberg's metric (Colby & Kohlberg, 1987a; 1987b), which would come to be known as the Standard Issue Scoring System (the SISS). The SISS was a codified, explicit procedure for *disclosing* and *determining* the degree of moral development in evidence in particular linguistic performances. Metrics gear into the properties researchers are interested in and disclose them for measurement, while models describe or explain those same properties, accounting for their being the way they are.

Importantly, both models and metrics are *representational devices*. This is a term that can be traced to Rawls (1996), who originally used it in the context of moral and political philosophy. He famously explicated the "original position"—an impartial and radically perspectival post-conventional view of social reality—in order to codify the basic tenets of a comprehensive theory of justice (Rawls, 1973). He would later retrospectively characterize the function of the "original position" by calling it a *representational device*. That is, he argued that it is best understood as a contrivance to help us *see* the world—to represent it—in terms of justice, and thus to help us hone our moral judgments about political situations. He had a broad notion of justice, and wanted to make a certain view of it readily accessible, so he built a *representational device*.

Understandably, philosophers have adopted the term for use in debates surrounding post-positivist theories of knowledge (Elgin, 2004). In this context, representational devices play a role in disciplinary knowledge production. Roughly speaking, representational devices serve as the parts of a discipline's epistemic architecture that purport to be *about* the world. That is, disciplinarians do not traffic in facts, first and foremost; they mainly traffic in representational devices, which are, more or less, a condition for the possibility of facts. From dynamic systems theorists' mathematical mock-ups to the Weberian ideal-types built by sociologists, we place representational devices between *ourselves* and *the world*, in order to arrange for a specifically desirable view.

In developmental psychology, as we have been discussing, metrics and models are the two main species of representational devices. Importantly, they come in different varieties. Models can be characterized as being more or less *descriptive* or *explanatory*. Piaget (1972) famously built both *descriptive* and *explanatory* models of cognitive development. Over the course of more than half of a century and based on observations and experiments on literally thousands of children, Piaget *described* various stage sequences (e.g., sensorimotor, pre-operational, concrete-operational, formal-operational) and suggested a set of *explanatory* constructs to account for their genesis (e.g., assimilation, accommodation, equilibration).

There are many approaches to building models in developmental psychology, but they can all be described in the terminology of a reasonably nuanced philosophy of science (Magnani &

Nersessian, 2002). Briefly, descriptive models arise from reasoning that is *inductive* (Peirce, 1986), that is, reasoning that involves generalizing from properties of a sample to properties of a population. Piaget found ways to usefully classify and describe the various types of cognitive structures he witnessed, and built a descriptive model by positing the *general applicability* of an idealized account of these cognitive structures. Explanatory models, on the other hand, arise from reasoning that is *abductive* (Peirce, 1986), that is, reasoning involving inferences to the best explanation. Piaget looked to the general principles of biological evolution and to philosophical logic in order to account for the transformations of cognitive structures he witnessed, and built an explanatory model by explicitly codifying these "guesses at the riddle."

Closely related to models and to metrics—but belonging strictly in neither category—are *clinical assessments*. This important area of developmental psychology is the province of trained professionals, from therapists to teachers and consultants. Clinical assessments are complex judgments about individuals rendered in uncertain real-life conditions, such as during the practice of psychotherapy (Sullivan, 1964). They are based on models of development endorsed by professionals and they function like metrics insofar as they classify and discriminate between persons. However, they are not as explicit and codified as true metrics; they must remain flexible and facile in the hands of the professionals who make them. Moreover, the value of different types of clinical assessments hinges in large part upon the quality of the professional practices that surround it. This also sets them apart from metrics, which are deemed valuable in terms of specific psychometric quality control parameters.

Metrics can be classified as *calibrated measures* or *soft measures*. As mentioned above, Kohlberg devised a metric for looking at moral development. Importantly, the SISS was a *soft measure* of moral development, built via mainly qualitative methods and offering a content-based means for honing in on the properties of moral reasoning indicative of its developmental sophistication. As such, it was mainly built for research purposes, and *not* for measuring individuals. Loevinger (1976) aimed to devise a metric for looking at ego-development. Specifically, she was looking to build a *calibrated measure*. By merging quantitative methods with qualitative ones and adhering to strict psychometric parameters, she constructed a *scale* of sentence-stem response-types. Although it is interesting to note that as well calibrated as Loevinger's metric was, she clearly stated that it was *not* to be used for rendering measurements of individuals (Loevinger, 1979; 1993).

On the Construction of Metrics in Developmental Psychology

The distinction between *calibrated measures* and *soft measures* is more difficult to understand than the difference between *explanations* and *descriptions*. This is because it requires some knowledge about how metrics are built in developmental psychology, and few know what goes on behind the scenes where developmentalists make their metrics. Therefore, before moving on to discuss the *quality-control devices* that should regulate the construction of models and metrics, and carrying out a limited literature review, it is worth explaining how researchers build developmental metrics. But to talk about developmental metrics requires some knowledge of *metrology*—the meta-disciplinary study of metrics.

Many who do theoretical work in *metrology* (e.g. Peirce, 2000; Piaget, 1972; Husserl, 1970) maintain that we can trace physical metrics like rulers and scales—and all the science that depends on them—back to the reliable capabilities of our organism and the concomitant sensorimotor practices that attune us to invariance in the world. These basic skills of being-in-the-world congeal into everyday practices that we take for granted (i.e., they form a part of the lifeworld). It is in the course of working to clarify this background of informal practices that we begin to build intersubjectively codified and calibrated metrics.

According to this view of metric making, the invariant psychophysical structures of our eyes account for the reliable differential responsiveness that justifies their use in gauging distances, a use eventually honed and codified during the collective construction of our metrics for length. However, the reliable differential responsiveness we take for granted when we interact with *things* differs from what it is during our interactions with *people* (Baldwin, 1906; Habermas, 1988; Wilber, 1995). Efforts at explicating deep-seated invariance in the social lifeworld have been dubbed *rational reconstructions* (Habermas, 1988, 1990). So when we set out to build metrics of psychological phenomena, it is the "invariant [psycho-social] properties and constitutive rules of the primary lifeworld…that can be made explicit [i.e. be rationally reconstructed] as a system of reference [allowing] for the transformation of communicative experience into measured data" (Habermas, 1988, p. 100).

Along these lines, we propose that developmental metrics should be understood as rational reconstructions of a kind of deep-seated intuitive knowledge that is *always already* a part of the network of practices and beliefs that constitute the lifeworld. Just as we unreflectively wield an intuitive knowledge of distance (based upon certain invariant relations between organism and environment) we also unreflectively wield an intuitive knowledge of development (based upon certain invariant psycho-social structures). Elsewhere, Stein (2008b) has marshaled suggestive empirical and theoretical arguments for this understanding of metric making in developmental psychology. This insight is important and ultimately suggests that developmental metrics are simply attempts to improve upon the ways we have always already made developmental judgments of each other and ourselves.

Again, the key to making a metric in developmental psychology is, as Habermas aptly described above, "the transformation of communicative experience into measured data." Specifically, we are suggesting that metrics in developmental psychology are built by rationally reconstructing—explicating and codifying—certain aspects of a preexisting reliable differential responsiveness, which we ordinarily use to make informal and intuitive developmental judgments, for example, for purposes of communication or education. Normally socialized adults automatically change their speech, action, and expectations when interacting with a child. They also typically change these over the course of an interaction with a stranger, as they gather a sense of where their interlocutor is coming from. Building a metric entails moving from this kind of everyday interpretation of language towards more systematic modes of differentiating between different types of linguistic performances.[1] To foreshadow: inter-subjectively codified modes of systematic differential classification lend themselves to techniques for *calibration*, and the degree and type of calibration determines a metric's status as either a *soft measure* or a *calibrated measure*.

---

[1] Importantly, with the exception of a few experimental paradigms (e.g., Piagetian balance beam tasks) all developmental metrics entail the interpretation of linguistic performances. This point is often overlooked.

The history of cognitive developmental research has been, in part, a history of techniques for the systematic classification of various performances and behaviors. It was Piaget who first pioneered the use of clinical or qualitative interview techniques for cognitive developmental research. In a series of now classic studies, Piaget (1926, 1932) demonstrated how to look for and discover the structural properties of linguistic performances that are indicative of development. As scholars have noted (Mayer, 2005), the radical innovation here was the careful and systematic classification of performances in terms of their developmental level. Piaget, who was trained as a biologist, was out to differentiate between different species of thought and action, so he built a hierarchical taxonomy of cognitive-structure types for classificatory purposes. Along with his collaborators, he codified methods for systematic differential classification that geared into specific properties of performances, properties that were officially christened as *indexes of development*. The first developmental metrics were built.

In the wake of Piaget, different developmental researchers have offered a variety of hierarchical taxonomies and related *indexes of development* for use in the systematic differential classification of performances. However, the general approach to metric making has been the same. As noted by various researchers (e.g., Colby & Kohlberg 1987a; Cook-Greuter, 1999; Jaques & Carson, 1994; Loevinger, 1976; Piaget, 1926), the codification of a metric begins with a research team issuing relatively informal judgments about how the various performances in a dataset should be organized developmentally. That is, they argue about why one performance is more developed than another, suggesting various properties of the performances that should function as indexes of development. Then through iterative procedures for garnering intersubjective agreement, an explicit hierarchical taxonomy emerges and specific properties of the linguistic performances are promoted to the status of being indexes of development. That is, developmental metrics are built to function as *representational devices*; they are created to help us *see* development by privileging specific properties of linguistic performances that have proven useful for the purpose of reliable differential developmental classification.

For example, Kohlberg (Colby & Kohlberg, 1987a; 1987b) and others (Armon 1984; Fowler, 1981; Kitchener & King, 1981) built their metrics by privileging certain types of conceptual content—conferring them a status as indexes of development.[2] These *content-based developmental metrics* facilitate differential developmental classifications by explicating and codifying the types of ideas and concepts that appear at different levels (e.g., in Kohlberg's SISS certain specific notions about "the golden rule" appear at stage 3). Thus, researchers analyze linguistic performances by looking for the presence of specific conceptual content, which is taken to be indicative of developmental level. Decisions about which types of content are indicative of which levels are made in the process of codifying the metric. As explained above, standard practice has been to *bootstrap* the codification of indexical content from large longitudinal data sets, organized via the collective judgment of a research team and then refined into an inventory of level-specific conceptual content via iterative procedures for garnering intersubjective agreement. This yields a *soft measure* that can be used for research purposes.

---

[2] This characterization of Kohlbergian metrics as *content based* is really just a claim about their *scoring manuals*. There is a great deal to be said for the domain specific *structural* indexes discussed in this tradition (e.g. socio-moral perspective taking), but the scoring manuals are mainly codified inventories of level-specific content.

Metrics based on the use of *sentence-completion methods* (Cook-Greuter, 1999; Loevinger, 1976) are almost exactly the same, except instead of developmentally classifying qualitative interview performances, they are used to classify responses to sentence-stems. As explained in detail by Loevinger (1976), the initial steps toward making her metric involved a group of researchers creating a hierarchical taxonomy of sentence-stem response-types by relying on their collective informal judgments. This initial intuitive developmental classification of response-types was transformed via iterative procedures for garnering intersubjective agreement into an explicit system for the differential developmental classification of sentence-stem responses. Then Loevinger carried out quantitative procedures for determining the internal consistency and interval spacing of the response-type categories, because, as mentioned above, she was out to build a *calibrated measure*.

A third family of developmental metrics has been developed alongside content-based and sentence-completion methods. This family of metrics was built in a slightly different way, focusing on the *deep structures* of linguistic performances. These metrics facilitate the differential developmental classification of performances without bootstrapping from conceptual content or an inventory of sentence-stem response-types. Instead, these metrics facilitate developmental analyzes that focus on ostensibly universal properties indicative of development, which have been distilled in the wake of empirical research and model building.

Kurt Fischer (1980) first explicitly characterized and gave primacy to the basic developmental process of *hierarchical integration*, which had been an important but relatively implicit construct in developmental theorizing for nearly a century. This important advance in modeling development cleared the way for new analytic techniques useful in describing developmental pathways and constructing hierarchal taxonomies for the developmental classification of performances. These new analytical techniques dubbed *structural* properties as indexes of development: for example, they privileged attention toward properties like differentiation/integration, concreteness/abstractness, simplicity/complexity. This approach makes it possible to build many domain-specific hierarchical taxonomies using one general procedure for differential developmental classification. As explained elsewhere, using Wilber's terms (Stein & Heikkinen, 2008), privileging structural indexes of development allows us to measure and assess development in many lines using one metric. Dawson, Commons, Wilson, and Fischer (Dawson-Tunik, Commons, Wilson, Fischer, 2005) employed a variety of sophisticated quantitative techniques in order to refine an elegant set of *deep-structural properties indicative of development*.[3] The General Stage Scoring System (the GSSS has more recently been named The Hierarchical Complexity Scoring System, the HCSS; but see: Commons & Richards, 1984) and the Model of Hierarchical Complexity (Commons, Trudeau, Stein, Richards, & Krause, 1998) were devised. The construction of the *Lectical Assessment System* (the LAS: Dawson, 2003, 2002, 2008) took off from this tradition of deep-structural analysis.

---

[3] Jaques and colleagues devised a comparable structure-based developmental metric, utilizing unique metric calibration techniques (Jaques, 1978) and a profound set of theoretical (Jaques 1970; 1976) and meta-theoretical accouterments (Jaques, 2002). This important strand of developmental research, theory, and practice has received only a footnote here because we are focusing on—for clarity's sake—the Neo-Piagetian tradition of structural metrics. However, in later work Jaques and colleagues (Jaques & Cason, 1994) have recognized their relations to this tradition, citing Fischer and Commons and drawing parallels between their respective metrics. (Cont’d next page).

Importantly, steps toward specific quantitative refinements of an otherwise qualitatively built metric—the steps that Loevinger and Dawson took, which Kohlberg did not—are what separates *calibrated measures* from *soft measures*. This excursus has set the stage for the discussion of *psychometrics* below, where we discuss in some detail what it means to calibrate a metric. However, at this point it should be said that we are definitively *not* suggesting that *calibrated measures* are, in principle, better than soft measures (or that these metrics are in principle better than *clinical assessments*). Depending on the situation and the metrics in question, a calibrated measure can be misleading where a soft measure is revelatory, and vice-versa. Moreover, a metric that was once calibrated can become soft when quantitative evidence wanes (e.g., Cook-Greuter, 1999). And a metric that was once soft can become calibrated if the accumulation of quantitative evidence waxes (e.g., Dawson-Tunik et al, 2005).

Nevertheless, calibrated measures and soft measures are different, and should be treated differently. Crucially, the inferences we are respectively entitled to make in light of them are not the same. For example, as mentioned above, if we want to measure *individual performances* we need to use a certain type of calibrated measure capable of making *reliable* fine-grained distinctions. If our categories are too loose and our expected measurement errors are too great, then we cannot reasonably say one performance is really more developed than another. This leads us into discussions about the *validity* and *reliability* of different types of metrics, which broaches the topic of *quality-control devices* more generally and the kinds of procedures that *ought* to be regulating the production of usable knowledge in developmental psychology.

Quality-Control Parameters: Building Useful Languages of Evaluation

We have seen how metrics are made and we have talked about models. Now we get to the heart of the matter, which is concerns about how we can make evaluations concerning the worth of specific metrics and models. Discussions about which metric or model is better than which other require decisions about how to determine their respective values. We are proposing a specific *modus operandi* for determining these values. We propose discussing the worth of metrics and models by adopting specific evaluative vocabularies—*languages of evaluation*[4]—that focus on the most important qualities that bear on the worth of both metrics and models. We

---

It is also worth noting here the influential model and metric devised by Kegan (1982; 1994), which deserves to be classed as a structure-based metric. However, while Kegan can be thought of as in the lineage of Piaget, he has never brought his work in line with the comparable Neo-Piagetain structure-based metrics discussed above.

[4] Stein (2007) has overseen the construction of comparable evaluative vocabularies elsewhere. The idea and phraseology can be traced in part to Taylor (1985). Although, Emerson and Marcus Aurelius toyed with the idea that to be human is to create and traffic in "vocabularies of praise."

dub these kinds of lexicons *quality control devices*. Inquiry-oriented communities of research and practice should, and often do, codify standards of quality for the representational devices they endorse and use. We are suggesting a way forward in this regard for certain areas of developmental psychology.

Figure 1 above specifies the key quality parameters that should guide the evaluative vocabularies we choose to deploy when considering different metrics and models. The distinction between *theoretical* and *practical* disciplined discourses is offered in light of a variety of comparable distinctions commonly made in epistemology and the philosophy of science. Habermas (1984, 1987) offers perhaps the most convincing and high-profile recent account, where he marshals his formal pragmatic analytical methods to justify a specific taxonomy of discourse types. Habermas includes a distinction between theoretical discourse (about the objective world; roughly cognitive-scientific) and practical discourse (about the social world; roughly moral-pragmatic). Importantly, just as descriptive and explanatory models come in many forms, there are many ways to tackle practical and theoretical disciplinary discourses.

For example, Habermas (1993) further specifies the topography of *practical discourse* by differentiating *pragmatic*, *moral* and *ethical* sub-discourses. These three focuses of practical discourse concern how we *ought* to be using our models: *pragmatic* concerns are about model's problem-focused efficacy; *ethical* concerns are about the value of the problems the model can be used to solve; *moral* concerns are about the social constraints on the proper use of the model. The point is not that Habermas' is the only evaluative vocabulary on offer, but rather that practical discourse represents a key area of concern—a key quality control parameter—that should orient the construction of some kind of related language of evaluation.

Importantly, Peirce (1931) offers his own comparable differentiations, likewise clearly partitioning practical discourse from theoretical discourse in his broad taxonomy of inquiry-types. He further specifies the topography of *theoretical discourse* by differentiating *utility*, *security* and *uberty* as the topics of specific sub-discourses (Peirce, 1998). These three focuses of theoretical discourse are roughly what are typically considered a model's scientific acumen: a model's *utility* is judged in terms of its functional-fit as a means-to-an-end; a model's *security* is a matter of the coherence and type of evidence in its support; a model's *uberty* concerns its suggestiveness and world-disclosing power. Again, the point is not that we must adopt Peirce's vocabulary, but that we must have *some* shared vocabulary to deploy when discussing the theoretical value of a model.

Thus, the goal of introducing these terms is to beef up the language of evaluation we bring to bear when we talk about the worth of various models produced by developmental psychologists. For example, take Wilber's (1999) early model of human development, as offered in the *Atman Project*. If we organize a discussion of its value around the terms just introduced, we can generate a rough profile of the model's practical and theoretical worth. Regarding its *theoretical* aspects, we think the *Atman Project* warrants valuing because of the model's *uberty*. That is, in our view, the model remains one of the only full-spectrum accounts of human development, and as such remains impressively suggestive as a rough overview of human potentials. This leads the model to have some minimal *utility* as a heuristic for various purposes, for example, alterations of one's action-orienting self-understanding. We do not think—and neither does Wilber—that the model boasts a great deal of *security*, however. That is, many of the particular claims are in need of revision in light of existing evidence, and many of the explanations and descriptions offered are only roughly correct. Regarding its *practical* aspects, we think the *Atman Project* is valuable. Its stated use as an overview of human potentials positions the model admirably in *ethical* and *moral* discourses. Who can object to what is ultimately a positive psychology? But the devil is in the *pragmatic* considerations; specifically, how can a model that is so general address any but the most abstract problems?

Now, the point here is not to merely pass judgment on models from the past. Our goal is to demonstrate how the evaluative vocabulary we suggest might orient our model-condoning discourses. At issue is not the evaluative judgments just rendered, but rather the terms we use to render these kinds of judgments about developmental models at all. At issue is how we arrange our language of evaluation and thus set the parameters of our concerns about quality control. Of course, we have no illusions about the selective and parochial nature of the specific vocabularies deployed above. There is a great deal to say when evaluating models, much more than we cover in this brief introduction. Questions of how and why a model is *true enough* (Elgin, 2004) are as complex and heated as questions about how it *ought* to be used (Habermas, 1971).

Psychometric Quality-control Parameters: Validity and Reliability

It should be clear from the symmetry of Figure 1 that the same idea holds when we switch to discuss psychometrics. The broad distinction between *reliability* and *validity* is canonical. But while there is agreement about this general differentiation of psychometric concerns, there are many different ways to unpack validity and reliability in more specific terms. Of particular use in this regard are the *Standards for Educational and Psychological Testing*, a document that has been recursively revised for over three decades by the American Educational Research Association (AERA), American Psychological Association (APA), and the National Council on Measurement in Education (NCME) (1999). The *Standards* represent the considered judgments of literally hundreds of disciplinary experts about the kinds of quality control standards that ought to be in place for metrics of various types; they guide the discussion that follows.

Concerns about the *validity* of a metric are concerns about the legitimate inferences that can be made about the measurements it yields. There are many different kinds of validity including but not limited to construct validity, content validity, ecological validity, and external validity.[5] Depending on the metric in question and the uses to which it is put, different aspects of validity become relevant. But all types of validity concern the question: *does the evidence suggest that the metric is measuring what it claims to be measuring?* It is important that the results yielded by a metric be valid—that we can be sure they are an index of what we think they are—so that we can make reasonable and responsible inferences based on them.

For example, it is generally agreed that *construct validity* is the most important dimension of psychometric concern (Messick, 1980). Evaluating a metric in terms of its construct validity entails looking into various types of evidence concerning how the results yielded by the metric conform to expectations about the postulated construct or trait it is meant to be measuring. That is, if the metric is meant to measure unidimensional wave-like growth—as certain neo-Piagetain metrics are, e.g., Dawson-Tunik et al. (2005)—then the result yielded by the metric should display a certain type of specific patterning. A metric with high construct validly allows us to make sophisticated inferences, guided by justified beliefs that we are, in fact, measuring what we claim to be. Of course, depending on what the metric claims to measure and on the uses to which it is put, different degrees and type of validity apply (AERA et al, 1999). But in general, we need information about the validity of a metric before we can responsibly do anything with it at all (Messick, 1980).

---

[5] Definitions for all these terms can be found in any standard reference (e.g., Colman, 2001; AERA et al, 1999).

Being concerned about *reliability*, on the other hand, entails looking into how well a metric performs its function as a measure. Put another way, this means considering the kinds of errors that are likely to systematically affect the results yielded. There are many different dimensions of reliability, including but not limited to inter-rater reliability, internal consistency reliability, and test-retest reliability.[6] But all forms of reliability concern issues of *measurement error*. It is important that we know the reliability of our metrics—that we know their degree and type of accuracy—so we can use them appropriately.

For example, *internal consistency reliability* is a quantitative index of how the items or levels of a metric function in relation to one another. As explained above, every metric is a system of categories for use in the classification of performances. Insight into the internal consistency of a metric gives us a sense of how much noise—how much *measurement error*—surrounds each category. Importantly, if the measurement error is too great—if the categories are too fuzzy or noisy—then few categories can be reliably distinguished from one another, and this reduces the accuracy of the metric.

Inter-rater reliability also bears on issues of measurement error. This form of reliability concerns the noise surrounding the metric as it is put to use by different human raters—i.e., different researchers using the metric. That is: how much consensus is there between two or more raters when they award a particular performance a particular level score? Low inter-rater reliability is an index that the results yielded by the metric are noisy; a certain performances is relatively likely to be given two different scores by two different raters. High inter-rater reliability is an index of the opposite; the performances are likely to be given the same scores.

Noisy metrics with reasonable measurement error are *soft measures*, and can be very useful for research purposes that place less demand for strict precision in differential classification. Metrics with very little measurement error are *calibrated measures*, and in some cases can be used to reliably measure individual performances because they offer a precise means of differential classification. However, as with validity, depending on the metric in question and the use to which it is put, different degrees and types of reliability become relevant. But in general, we need information about the reliability of a metric before we can responsibly make use of the results it yields.

---

[6] Definitions for all these terms can be found in any standard reference (e.g., Colman, 2001; AERA et al, 1999).

Limited and Exploratory Literature Review

This brief overview of psychometric quality control parameters is meant to serve only as an introduction to the kind of language of evaluation we ought to employ to distinguish between the value of different metrics. Importantly, as mentioned above, metrics claming to be *soft measures* should be held to different standards from those that claim to be *calibrated measures*. That is, *soft measures* have different *reliability and validity profiles* than *calibrated measures*. But because this kind of information is essential to how we can appropriately use each measure, we are suggesting that we ought to issue some kind of reliability and validity profile for *every* metric in circulation. This would amount to adopting an explicit and shared multidimensional psychometric evaluation matrix, representing the quality control standards we think should regulate the production of metrics.

To this end we offer Table 2, which represents the result of a *limited and exploratory* literature review of metrics currently in play. *This is not meant to be an exhaustive survey*; instead our intention is to evoke the state of the readily available literature. First, we sought out references to validity and reliability studies in those key publications of the primary authors that we happened to have on hand. Second, we conducted searches in two databases: Google Scholar and PsycInfo. We reviewed the first 20-30 citations listed, passing over most dissertations and all conference papers. Any citation that included validity or reliability studies was then included. To give the reader an idea of the relative sizes of the available pools of literature, the number of hits from the primary search term in each database is listed in parentheses in the footnotes.

Table 2: Exploratory Review of Validity and Reliability Studies for a Set of Developmental Metrics

Metric	Source	Aspect of psychometric quality addressed	Publication type
Leadership Development Profile[7]	None found.		
Spiral Dynamics[8]	None found.		
SCTi / MAP[9]	Cook-Greuter, 1999	Content validity, inter-rater reliability	Dissertation
Requisite Organization[10]	Jaques, 1978	Construct validity	Book
	Jaques & Cason, 1994	Inter-rater reliability	Book

---

[7] Search terms: "leadership development profile" (hits: 35; 0), "leadership development profile" reliability, "leadership development profile" validity. Rooke and Torbert (1998) and several other Torbert works cite Loevinger's studies as confirmation of the LDP's reliability and validity. But Loevinger's studies are out of date (new raters, scoring criteria, and levels are now used; metrics need to be re-calibrated), so they are not included here.

[8] Search terms: “spiral dynamics” (hits:879; 11) “spiral dynamics” “people scan,” “spiral dynamics” validity, “spiral dynamics” reliability. Includes a large number of irrelevant hits having to do with physical science.

[9] Search terms: SCTi (irrelevant results), MAP assessment (irrelevant results), “Susanne Cook-Greuter” (hits: 71; 2).

[10] Search terms: "requisite organization” (hits: 526; 4), "requisite organization" reliability, "requisite organization" validity.

Metric	Source	Aspect of psychometric quality addressed	Publication type
Subject Object Interview[11]	Lahey, Souvaine, Kegan, Goodman, and Felix, 1988	Inter-rater reliability, test–retest reliability, construct validity	Self-published training manual

	Xie & Dawson, 2006	Construct validity	Peer-reviewed journal
Lectical Assessment System[13]	Dawson,* 2000	Congruent validity, internal consistency, inter-rater reliability	Peer-reviewed journal
	Dawson,* 2002	Congruent validity, inter-rater reliability	Peer-reviewed journal
	Dawson, 2006	Construct validity, evidence of fine-grained interval scale	Book chapter
	Dawson-Tunik, 2004	Construct validity, internal consistency, evidence of fine-grained interval scale	Peer-reviewed journal

Importantly, Table 2 is not meant to be an exhaustive literature review. We know we have missed some studies and left a few metrics out. But the table is offered as a kind of proof-of-concept, an example of the way our concerns about quality control interface with knowledge production in the discipline. In this respect, the table is an invitation to the community; we would like to see comparable tables built by others, especially by the actual researchers concerned. We are just trying to kick-start a concerted discourse about quality control in the field.

---

[11] Search terms used: "Subject Object Interview" (hits: 105; 30), "Subject Object Interview" validity, "Subject Object Interview" reliability, "Subject Object Interview" interrater reliability, "constructive development theory"

[12] Search terms used: "hierarchical complexity scoring system" (hits: 49; 9). System had a name change from GSSS to HCSS.

[13] Search terms used: “Lectical Assessment System” (hits:12; 0). Studies with an asterisk are those conducted on an early version of the LAS, temporally named the HCSS. However, despite all name changes, the LAS is significantly different from the HCSS previously known as the GSSS.

From what we could find, there is no evidence that the Online PeopleScan by Spiral Dynamics Integral offers reliable or valid measurements of anything. In this preliminary review, it also appears that contemporary uses of sentence completion methods to measure ego-development are not justified by peer-reviewed validity and reliability studies, and what studies there are do not address the most important aspects of psychometric concern (i.e., construct validity and internal consistency). In fact, in light of this exploratory literature review, it appears that the LAS and HCSS are the only metrics that have been calibrated using quantitative indexes of internal consistency. This means that the LAS and HCSS are the only ones that can be validly and reliably used to assess individuals; they are the only *calibrated metrics* in the set, the rest are *soft measures* that should only be used for research purposes. If we have missed publications (or unpublished white papers) we apologize, but offer this table as an invitation for greater transparency and integrity amongst researchers. Let us work together to fill out and expand the table, making clear to each other and to all those affected exactly what we are doing.

If we want to see an integral and developmental worldview gain a real institutional foothold—radically reforming business, government, education, therapy, and our own sense of human potentials—we need to get serious about our quality control standards. How can we expect to change *status quo* means of human resource management, educational testing, and mental health care when their knowledge production processes are more rigorous and professionalized than ours? Of course, there are more than merely pragmatic concerns on the table. As explained elsewhere (Stein, 2008a), there are important ethical issues in play. Concerns about psychometrics dovetail with concerns about *justice* insofar as our measures affect the lives of individuals and structure the shape of communities (Fisher, 2004; 2005). The call for quality control issued here is not a merely academic exercise.

Conclusions: Toward an Integral and Problem Focused Metrological Pluralism

In this paper we have offered an overview of knowledge production processes in developmental psychology, with an eye toward instituting quality control parameters for the creation of usable knowledge in the discipline. Clearly, the cursory treatment offered here requires further elaboration. In particular, the complex relations between metrics, models, and their respective quality control devices has been left for another day. Likewise, a very important discussion needs to take place concerning the transition from theory and research to practice, that is, about the methods we use in the creation and dissemination of psychological technologies. But we have not been seeking to offer *the* definitive account. We are really just pointing to the kind of reflective explication and survey that should be done by those concerned about the production of this kind of usable knowledge.

We have focused on metric-making in particular because it seems to be the least understood aspect of the discipline. We traffic in models all the time, and are more or less used to judging their worth (even if we have no shared language of evaluation). But metrics play a very specific role in developmental psychology, as embodiments of usable knowledge. As Table 2 begins to demonstrate, there are many metrics currently in play and they are not all equally valid and reliable. The kinds of validity and reliability profiles we are suggesting would go a long way toward raising the level of our discourse about developmental metrics. Importantly, a sophisticated discourse about metrics would *not* necessarily result in a homogenization of metric types or a marginalization of metrics with certain profiles. In fact, we firmly believe that such a discourse about metrics would move us toward an *integral and problem focused metrological pluralism*.

The ideal of an *integral and problem focused metrological pluralism* suggests that we reflect on the way we use developmental metrics, in order to make principled decisions about which types of metrics are appropriate for which purposes. In order to do this we need to build validity and reliability profiles for existing metrics and begin to dialogue about the implications of what we have to work with. This rigorous reflection on metrics should be supplemented with reflections on the problem-spaces we face. What are we trying to do with the metrics we have? For example, it is likely that clinicians and coaches need different metrics than researchers, while educators require measures that differ from those used by organizational consultants.

This ideal would also suggest that we need to study the efficacy of our efforts, and feed this data back into our reflections about which metrics are good for which purposes (Stein, 2008a). Currently, our success stories are anecdotal, so our enthusiasms seem a bit naïve. As the limited and exploratory literature review above suggests, we do not really know the nature of the instruments we wield. We need real *clarity* on a variety of issues—including not only psychometric ones, but also ethical, political, and pedagogical ones—before we can reasonably and responsibly move forward. To our minds, this clarity is a function of collaboration.

An *integral and problem focused metrological pluralism* ultimately requires open collaborative efforts toward building usable knowledge. A first step would be expanding and filling out Table 2 above, that is, building something like an information clearinghouse for developmental approaches. This kind of transparency among researchers, and between researchers and the public, could catalyze the growth of the discipline, moving us away from a set of cloistered consultancies and toward a network of collaboration, knowledge sharing, and rigorous debate. Thus, we echo the call for something like an *Institute for Applied Developmental Theory*, as articulated by Ross (2008) on prior pages of this journal. More specifically, this paper is offered as an invitation to those who might want to shape the future of the field and—with the support of *Integral Review* editorial staff—invite responses from the community.

Establishing Second-Person Forms of Contemplative Education: An Inquiry into Four Conceptions of Intersubjectivity[1]

Olen Gunnlaugson

Abstract: Four accounts of intersubjective theory are explored as a means for providing distinctions that support the development of second-person approaches to the emerging field of contemplative education. I examine Martin Buber's conception of the interhuman, Thich Nhat Hahn's interbeing, Christian De Quincey's three modes of intersubjective engagements, in addition to Wilber's five categories of intersubjectivity with consideration for how each will contribute to further outlining second-person dimensions of contemplative education. I then locate intersubjectivity in a broader epistemological terrain and propose the notion of *critical second-person contemplative education* as a type of pedagogy and approach to learning within contemplative education.

Key words: consciousness, contemplative, intersubjective, second-person education.

Introduction

While contemplative practices have been foundational to wisdom traditions throughout recorded history, it is only recently that these practices are being examined in different contexts of learning, particularly in higher education. In the past decade, several academic conferences[2] and a growing educational literature have focused on contemplative approaches to teaching, learning and knowing (Brady, 2007; Duerr et al., 2003; Hart, 2004; Miller, 1994; Seidel, 2006;

---

[1] This article was researched with the financial support of a Doctoral SSRHC (Social Sciences and Humanities Research Council of Canada) Canadian Graduate Scholarship.

[2] The following conferences have either exclusively focused on or featured presentations about contemplative education in recent years: *Contemplative Pedagogy in Higher Education* (Amherst College, May 2003), *Contemplative Practices and Education: Making Peace in Ourselves and in the World* (Teachers College, 2005), *Uncovering the Heart of Higher Education* (San Francisco, 2007), *Mindful Learners: The Uses of Contemplative Practice in the Classroom* (CUNY, 2006*), Developmental Issues in Contemplative Education* (Garrison Institute, 2008*).* Additionally, there is a graduate program in Contemplative Education at Naropa University, Contemplative Studies at Brown University and the University of Michigan as well as the *Rocky Mountain Contemplative Higher Education Network* based out of Colorado for academics interested in contemplative approaches to education. Over the past decade through the *Center for Contemplative Mind* there have been annual contemplative retreats and over 130 individual fellowships for $10,000 US issued to academics across North American campuses to develop courses that employ contemplative practices. Also, over the past decade there have been annual retreats at Naropa's *Center for the Advancement of Contemplative Education*, as well as a special feature journal issue on contemplative education with the Teacher's College Record (September, 2006).

SOME RIGHTS RESERVED

Thurman, 2006). Existing theoretical and qualitative research in contemplative education includes the following areas of focus: integration of contemplative practice in academia (Apffel-Marglin & Bush, 2005; Hall & Archibald, 2008; Nelson, 2006; Zajonc, 2006); studies of mindfulness in higher education settings (Holland, 2006; Langer, 1997); presence (O'Reilly, 1998; Seidel, 2006); contemplative learning in holistic education (Grossenbacher & Parkin, 2006); teacher development (Brown, 1998; Miller, 1994); prospects for a new field of studies (Duerr et al., 2003; Roth, 2006); survey of K-12 programs using contemplative practices (Garrison Report, 2005); meditation as a vehicle for contemplative education (Brady, 2007; Sarath, 2003; Zajonc, 2008); and contemplation as creativity (Brady, 2007; Sarath, 2006). These and other contributions draw broadly from the perennial world wisdom traditions (i.e., Buddhist, Taoist, Quaker) and recent scientific research (i.e., neuroscience, cognitive science, clinical psychology) in the interests of investigating contemplative practices[3] as a means for enhancing learning and development across a broad array of educational contexts and disciplinary fields.

Naropa University, a leader in contemplative education, defines and outlines their approach:

> Contemplative education is learning infused with the experience of awareness, insight and compassion for oneself and others, honed through the practice of sitting meditation and other contemplative disciplines. The rigor of these disciplined practices prepares the mind to process information in new and perhaps unexpected ways. Contemplative practice unlocks the power of deep inward observation, enabling the learner to tap into a wellspring of knowledge about the nature of mind, self and other that has been largely overlooked by traditional, Western-oriented liberal education. This approach to learning captures the spark of East and West working within; it's the meeting of two of the greatest learning philosophies in the history of higher education. (Naropa University, 2008)

Informed by various contemplative wisdom traditions, contemplative education involves the integration of contemplative practices into the curriculum of traditional higher education settings for the purposes of fostering intuitive, non-conceptual and experiential forms of knowing along paths of learning characterized by wholeness, unity and integration.

As a prominent voice within contemplative education, scholar-practitioner Harold Roth (2006) advocates exploring contemplative exercises from critical first-person and third-person perspectives.[4] In the few articles that address epistemological issues (Roth, 2006; Sarath, 2006), sufficient attention has not yet been given to contemplative pedagogy[5] from second-person perspectives, with a present gap in the literature concerning intersubjective approaches to pedagogy and learning. Given the absence of a systematic study of the philosophy, psychology and phenomenology of intersubjectivity, as scholar-practitioners, there is a need to further outline how to identify, discern and experience key second-person approaches to contemplative pedagogy and learning in our classrooms.

---

[3] Traditional contemplative practices include meditation, prayer, chanting, ink brush painting, ritual performance as well as music, dance, storytelling, martial arts, contemplative art, among others.

[4] Roth (2006, p. 1805) points out that first-person approaches to contemplative experience involve exploring contemplation from a subjective position within the individual learner, while third-person approaches aspire to examine contemplative experience from an objective position that is presumed to be outside of us.

[5] I define contemplative pedagogy as any first-, second- or third- person contemplative practice that is utilized for educational purposes. Generally contemplative practices invoke heightened states of consciousness or contemplative awareness, which is "a state of being in which one is fully present and attuned to the world, bracketing thinking, judging, and analyzing, while trying to see clearly (Kesson, 2006, p. 1879). While contemplative pedagogy may draw on contemplative practice, not all

For the purposes of this article, second-person approaches to contemplative education involve exploring contemplative experience from an intersubjective position that is represented spatially as *between* us, in contrast to *inside* us (subjective position) or *outside* us (objective position). As the four accounts of intersubjectivity in this article attempt to demonstrate, there are different dimensions to shared experience that call upon distinct features of this relational perspective.[6]

Intersubjective theory has surfaced in recent decades from diverse developments in consciousness studies, integral studies, philosophy of mind, transpersonal psychology and feminist critical theory among others. Partly in response to the problematic legacy of Cartesian rationalism that proceeds epistemically by objectifying and depersonalizing one's self and the world (Ferrer, 2001), a number of intersubjective theorists (Bai, 1999, 2004; De Quincey, 2000, 2005, Heshusius, 1994; Thompson, 2001) have made the effort to establish the validity of certain shared processes of knowing born through and inside relationship. In doing this, these contributions have provided an important epistemological rebalancing and movement towards more integrated visions of knowledge and the processes of knowing.

Within educational contexts, intersubjectivity has been applied for improving teaching designs for a community of learners in terms of focusing on the common elements of attention, understanding and communication (Matusov, 2001). Related to this application is the design of a shared pedagogical object for the learning activity (EngestroKm, 1990), which the educator and students explore during the lesson (Wertsch, 1979). Intersubjectivity has also been applied in the context of special consensus-based learning activities (Matusov, 1996). Framed as a move from egocentric to sociocentric thought (Soltis, 1985), intersubjectivity has served the educational purposes of dialogue instruction (Guilar, 2006) focusing on the interrelationships between teachers, student and content.

In the upcoming sections I consider the following accounts of intersubjectivity[7] with an interest[8] in their relevance to contemplative education: Martin Buber's conception of the

---

contemplative practices are suitable within educational contexts. As such, it is advisable that educators explore a particular contemplative practice outside the classroom in order to determine which (if any) elements will be appropriate in serving their teaching objectives and the learning needs of students.

[6] For the purposes of this article, I am focusing primarily on the individual and shared aspects of consciousness in the context of relationality and group discourse. Due to the limitations of space and the specific focus and scope of the article, I have not chosen not to address the myriad personal histories, social, cultural or political voices of students that play an important role in shaping classroom interactions.

[7] I chose to focus on these four intersubjective theorists as their contributions to intersubjectivity theory are rooted in and informed by deeper existential interests in the human condition. Additionally, each proceeds with an underlying sacred orientation to their inquiry and holds a deep-seated commitment to evolving human consciousness with their work. I believe these aspects are particularly relevant to my project insofar as theorizing about the deeper dimensions of intersubjectivity seems to require at the very

interhuman (Buber, 1965, 1966, 1984; Kramer, 2003), Thich Nhat Hahn's interbeing (Bai, 1999, 2004; Nhat Hanh, 2000; Nakagawa, 2000; Rothberg, 1998), Christian De Quincey's three forms of intersubjectivity (2000; 2005; Hargens, 2001) and Ken Wilber's integral dimensions of intersubjectivity (Wilber, 1996, 1997, 2000, 2006; Hargens, 2001). Following this, I recontextualize these intersubjective approaches as contributions from a second-person perspective within both Wilber's (2006) and Edwards' (2005) epistemological maps. I then take up Sarath's (2006) consideration of second-person forms of knowing and learning and introduce the notion of *critical second-person forms of contemplative education* raised in my brief summaries and critical readings of the four above accounts of intersubjectivity as a framework for engaging with contemplative educator's approach to teaching and classroom learning.

Four Conceptions of Intersubjectivity

Buber's Conception of the Interhuman

A twentieth century religious existential philosopher, Martin Buber has been a prominent voice in advocating the ideals of sacred consciousness, interpersonal relationship and dialogue in community. Buber's philosophical contribution involves framing human existence as contingent upon interpersonal modes of consciousness, interaction and being through which one engages with other humans, nature, the inanimate world and the sacred. Best known for his distinctions of I-Thou and I-It relationships (1965, 1966, 1984), Buber argues that human life consists of a movement between meeting and mismeeting in these realms, with the I-thou representing a sacred form of relationship (which is central to interhuman relations) and the I-It a more common secular variety (Buber, 1965). In Buber's (1984) monological I-It relationship, others are regarded like an "object" in a world that largely consists of people to be interacted with in order to serve our desires and ends. Buber (1984) elevates the personhood, needs and interests of the other as "subject" in the dialogical I-Thou mode of relationship, basing it on a responsiveness

---

least, an experiential familiarity with the shared potentials of consciousness—a capacity that is exemplified in the work of each of these theorists.

[8] My interest and passions for intersubjectivity and contemplative education arise from a number of sources. As a dialogue educator and facilitator, I have taught post-secondary courses over the past eight years utilizing generative dialogue processes in Sweden, USA and Canada. My research, partly informed by these experiences, has been primarily of a theoretical and philosophical nature with an overarching interest in clarifying and inquiring further into the conditions for students to experience integral forms of transformative education mediated by deeper intersubjective dimensions of teaching and learning. As an eclectic Buddhist practitioner and meditator, I am interested in inquiring further into consciousness-related approaches to learning and related themes. This project is in part motivated by an interest in deepening and broadening the evolution of consciousness discourse in the contemplative education literature as well as improving upon my knowledge and expertise in these areas as a scholar-practitioner. In addition, as a personal coach, my interests in self-actualization have developed a strong interest in learning the skillful means and capacities needed to support the conditions for personal transformation in my students and clients. Finally, my interest in cultivating second-person forms of contemplative education is also motivated by my experiences in various communities of practice that applied presencing and other intersubjective practices to our collective process, where we discovered and co-enacted deeper creative possibilities that I believe have a yet untold significance in classroom life.

to and confirmation of the other, the other’s deeper humanity and the existing present-ness of the situation. Wood (1999) elaborates on the I-Thou relation:

> For Buber, I-Thou relations are unique, unpredictable, immediate, and involve the whole of oneself ‘bound up in reciprocity’ with the other. I-It relations are linked to the universal, are predictable, mediated by past experience, and involve only a part of oneself which stands at a distance from the object. I-It relations are third-person relations, so that for ‘It’ one could substitute also ‘He’ or ‘She’ of ‘They.’ (Wood, 1999, p. 84)

Distinguishing these two very different modes of existence, the I-Thou relation draws upon a second-person basis of connection that emerges through our encounters with others. In adopting the I-Thou attitude or stance towards relationship, there is a turning towards and acknowledgement of a more elemental and existential experience of another.

Throughout Buber’s works, he tends to sharply contrast the I-It relationship and I-Thou relationship. At times this leaves little room for more nuanced and paradoxical modes of being and meeting that are not exclusively apart of either archetype. Sidorkin (2000) elaborates:

> It is either I-Thou or I-It, all or nothing. There is nothing else and nothing in between. In his later work, Buber tried to enrich this binary model by introducing the notion of *Zwischenmenschliche*, or the interhuman. The interhuman consists of elements of every day life that may lead to a genuine dialogue, or, as Buber describes it, “I-Thou” relation. (Sidorkin, 2000, p. 10)

As a context that is “generated by the immediate presence that binds together a conscious “self” with a conscious “other.”” (Kramer, 2003, p. 78), the interhuman offers a key dormant dimension of intersubjective experience that learners discover through I-Thou meeting:

> When two individuals "happen" to each other, there is an essential remainder that reaches out beyond the special sphere of each-the "sphere of the between." In an essential relation the barriers of individual being are breached and "the other becomes present, not merely in the imagination or feeling, but in the depths of one's substance, so that one experiences the mystery of the other being in the mystery of one's own. (Buber, 1965, p. 170)

The interhuman involves relating to others as partners in a living intersubjective event, bringing about a context where I-Thou relationship may emerge (Buber, 1966). Given that the interhuman offers no smooth continuity, it has been largely ignored (Friedman, 2001). Yet, in aspiring to meet from the interhuman and confirming one another, in spite of whether one is in agreement or not, there is an occasion to stand one’s own ground while (in the context of our classrooms) we meet our students on theirs. In a classroom where an educator is exploring a collective form of contemplative pedagogy, learning from the context of the interhuman would be contingent on the educator’s quality and capacity for sustaining presence with her students. Additionally, it would depend upon her capacity to confer, share and invite students into fostering I-thou forms of relating *collectively* as an underlying process informing the inquiry. Buber’s characterization of the interhuman describes a subtle way of being with others from the condition of presence, where former barriers or boundaries between self and other soften, offering an *existential* referent in that it enables the self and the other to become more immediate, tangible and real.

Buber locates the interhuman sphere of the between beyond the domain of the conditioned socialized self which typically engages in I-It forms of relationship. For Buber, the interhuman cannot be reduced to an "it" or "thing" and emerges "in the presence of spontaneous mutuality" (Kramer, 2003, p. 104). Expanding upon the modes of mismeeting that typify I-It encounters, and forms of meeting with the I-Thou, Buber posits the "supreme meeting" (2003, p. 47) as indicative of special peak experiences in the deeper realms of the interhuman where it is possible to experience *pure relation.* From these moments of supreme meeting with students, one is initiated as it were into a sacred *relational* experience of second-person knowing through the interhuman realm of intersubjectivity.

Ironically, while Buber advocated for such encounters, he disliked groups as Sidorkin (1995) elaborates:

> Buber is right, most of the groups most of the time probably do suppress an individual relation. But a group might become a nurturing community, a special kind of group that is not hostile to, but inviting of the interhuman. As we can see, Buber states that the interhuman encounter happens within the group only as a *secondary* meeting, while the work of the group is the main concern. A nurturing community is the group where this hierarchy is reversed. It is a group where the interhuman is the primary concern, and what the group actually *does* together moves into a subordinated position. (Sidorkin, 1995, p. 5)

In this passage, Sidorkin uncovers a key insight concerning the importance of leading classroom interactions from the intersubjective domain of the interhuman. This becomes quite relevant in the context of second-person forms of contemplative education, as all conversations take place intersubjectively. Yet, contact with and inquiry informed by the deeper ontological domain of the intersubjective that Buber's interhuman signifies may be subtly eclipsed, inadvertently marginalized or skipped over in the effort to fulfill content objectives in the courses we teach. Reflecting on previous teaching experiences that draw upon collective forms of contemplative pedagogy, I have come to appreciate the importance of aspiring to speak and listen from Buber's interhuman sphere of the between with students as the primary context for orienting collective contemplative learning processes.

With the interhuman encounter as the primary basis for meeting, it becomes possible for both the educators to recalibrate their teaching stance and the students to in turn recalibrate their learning stance towards a shared I-Thou orientation. Honoring a primary commitment to fostering Buber's sphere of the between with our students helps bring about a shift in the classroom ethos towards becoming a more nurturing community (Sidorkin, 1995). In this sense, Buber's work offers a helpful insight into the transformative potential of addressing one another through deeper presence in the intersubjective encounter, which can give rise to an ontological shift in the context of our inquiry and learning within educational settings. By implementing contemplative second-person approaches that are not only aware of the relational and sacred implications of I-thou encounters with our students, but also committed to enacting the interhuman as a primary concern, I believe Buber's contributions to intersubjectivity can shed important light on one of the necessary preconditions for collective contemplative methods informed by the deeper ontological realms of the interhuman sphere of the between.

Nhat Hanh's Interbeing

Drawing from his Vietnamese lineage of Buddhism in the East and life experience in the West, Buddhist monk, scholar, poet, and peace activist Thich Nhat Hanh's teachings of engaged Buddhism speak to a broad cross section of people from various religious, spiritual, and cultural backgrounds. Known for his work with mindfulness in daily life, Nhat Hanh is a passionate exemplar of uniting Buddhist contemplative practice with social action and inter-religious dialogue.

Within Nhat Hanh's teachings, his depiction of interbeing (2000) is informed by the central Buddhist theory of *pratitya-samutpàda* (Nakagawa, 2000), which literally means *contingent origination*, but is often translated as *dependent co-arising*. From the perspective of interbeing we radically coexist and are fundamentally interrelated with what is "other" unlike the Cartesian dualistic account of human experience, in which we exist independently in and for ourselves. As a lens to help us experience the ground and fabric of relationality within and beyond the human domain to include all of life, interbeing depicts the self as an active co-participant in a greater shifting matrix of mutual causality and interrelationship. Within the Buddhist tradition, when *pratãtya-samutpàda* is deeply understood by practitioners, it helps bring liberation from the root of suffering and delusion insofar as the *separate* self-sense is seen through as an impermanent psychological construction, empty of any abiding or independent constitution (Nakagawa, 2000). *Pratãtya-samutpàda* also offers a classic phenomenal depiction of how we emerge through interdependent relations and how all events are deeply interwoven and mutually conditioned.

Nhat Hanh (2000) builds upon this classic Buddhist insight and goes a step further by emphasizing how the realization of interbeing gives rise to an increased sense of interconnectedness, bringing about a more inclusive and deepened ethic of responsibility for others. As such, his account of interbeing offers an important perspective for engaging with the underlying process-oriented nature of reality. By illustrating how our everyday experience of self and world are deeply interconnected, interdependent and interrelated, interbeing validates the underlying intersubjective ground of being that human experience is ultimately contingent upon.

When viewed within a contemplative educational context, interbeing brings attention to how the students, the classroom subject of inquiry, the process of inquiry and educator shape and co-constitute one another. As a "pedagogy of communion" (Nakagawa, 2000, p. 50), interbeing helps deconstruct our conditioned identification with our *separate* self-identity as an educator and, in turn reconstruct our primary identification with *interconnected* experiences of self and the attendant co-constitutive classroom processes. The practice of interbeing foregrounds the dynamic interrelated elements of the learning process with one's students, which cultivates compassion and an education of heart (Dalai Lama, 1999). Whether through a contemplative reconstruction of our student's points of view or a willingness to feel our student's distress concerning a particular injustice and resulting suffering on a particular issue, interbeing disrupts our traditional sense of agency and western self-sufficient ideals of individuality.

Upon closer inspection, interbeing offers the possibilities of what Wilber describes as "agency-in-communion" (Rothberg et al., 1998, p. 216). That is, an agency that is no longer being motivated by a traditional idealized masculine stance of autonomy that avoids, suppresses or denies communion. From the perspective of interbeing, our individual strength and source of empowerment are fueled by our connection(s) with others within greater fields of interrelatedness, further helping us see through the false Cartesian dualism of personal autonomy versus relationship. Bai (1999) elaborates: "The self dynamically flows into, out of, and with the other, creatively assuming a complex, polymorphous sense of agency. It is not the simple sense of agency wherein the subject (the self) does something to its object (the other)" (p. 4).

Through this *polymorphous sense of agency*, the tensions of individual agency and communion lie in the paradoxical dance of, on the one hand, becoming increasingly attentive to our interrelatedness with others (i.e., our students) without, on the other hand, binding one's sense of self to them. Such an intersubjective orientation can also help us avoid falling into either extreme of what Wilber (Rothberg et al., 1998, p. 216) frames as *pathological agency* (which avoids or denies communion) or *pathological communion*, where we become overly identified with relationality to the extent that we find ourselves submersed in orienting from the needs of others.[9]

How might interbeing advance the project of developing second-person contemplative pedagogy in higher education settings? Interbeing provides an intersubjective context and process that can be of great use in informing the development of second-person methods. By attending phenomenologically to the distinctive intersubjective space(s) we co-inhabit with our students, the educator learns (with practice) to see through the dualistic tendencies of his or her own consciousness—particularly in terms of how this reinforces different forms of separateness and fragmentation in group contexts of classroom learning. By forging a more distributed basis of connection with our students, the class subject and the processes of contemplative inquiry, seeing with the eyes of interbeing can help facilitate a shift into a deeper second-person intersubjective experience. As these elements coalesce, occasions for engaging with multiple contexts of self and otherness invariably arise. By modeling and encouraging a less rigid identification with our conventional identities, interbeing also offers a more distributed context of inter-relationality, which in turn establishes a broader ground and intersubjective context out of which we can lead the class inquiry. This helps relieve everyone of the individualistic if not narcissistic habit of blocking the intersubjective view by being in the middle of a conversation or steering classroom discourse with one's private agenda. By valuing and amplifying our shared experience of consciousness, the lens of interbeing brings into focus the more subtle unseen aspects and sinews of interrelatedness with our students, the subject and process of inquiry.[10] This helps us relax the habituated compulsion to know and deliver an authoritative view to our students.[11] In the context of classroom inquiry, interbeing can help students and educator regard the classroom as a place for occasions of interconnectedness and the co-constitution of shared meaning.

---

[9] While our culture suffers from both pathological tendencies, Wilber's integrated notion of agency-in-communion offers a helpful distinction to monitor our ontological orientations for being in the world.

[10] Given that (a) interbeing extends far beyond the context of intersubjectivity and (b) the urgent need for a more comprehensive ethic of responsibility towards others, in certain higher education classroom settings it will be constructive to broaden the scope of the interbeing lens by expanding beyond the students in the class to include greater contexts such as all humans and the more than human world.

In addition to the applications of Interbeing discussed above, educators may wish to impart a taste of the experience by introducing a guided visualization informed by Nhat Hanh's (1998) writings:

> If you are a poet, you will see clearly that there is a cloud floating in this sheet of paper. Without a cloud, there will be no rain; without rain, the trees cannot grow; and without trees, we cannot make paper. The cloud is essential for the paper to exist. If the cloud is not here, the sheet of paper cannot be here either. So we can say that the cloud and the paper inter-are. "Interbeing" is a word that is not in the dictionary yet, but if we combine the prefix "inter-" with the verb "to be," we have a new verb, inter-be. Without a cloud and the sheet of paper inter-are. If we look into this sheet of paper even more deeply, we can see the sunshine in it. If the sunshine is not there, the forest cannot grow. In fact, nothing can grow. Even we cannot grow without sunshine. And so, we know that the sunshine is also in this sheet of paper. The paper and the sunshine inter-are. And if we continue to look, we can see the logger who cut the tree and brought it to the mill to be transformed into paper. And we see the wheat. We know the logger cannot exist without his daily bread, and therefore the wheat that became his bread is also in this sheet of paper. And the logger's father and mother are in it too. When we look in this way, we see that without all of these things, this sheet of paper cannot exist. Looking even more deeply, we can see we are in it too. This is not difficult to see, because when we look at a sheet of paper, the sheet of paper is part of our perception. Your mind is in here and mine is also. So we can say that everything is in here with this sheet of paper. You cannot point out one thing that is not here-time, space, the earth, the rain, the minerals in the soil, the sunshine, the cloud, the river, the heat. Everything co-exists with this sheet of paper. That is why I think the word inter-be should be in the dictionary. "To be" is to inter-be. You cannot just be by yourself alone. You have to inter-be with every other thing. This sheet of paper is, because everything else is. (Nhat Hanh, 1998, p. 3)

While such visualization exercises can be helpful in bringing about a shift in our accustomed habits of perception and ways of apprehending and relating to the world, there invariably will be occasions when it can be challenging to experience interbeing with students. Nhat Hanh's depiction of interbeing offers a means for working with the resistances in ourselves to what is "other" in our classrooms, as well as to the elements in our students and ourselves that we may resist and for whatever reasons, cannot or refuse to openly engage with. By identifying and finding a basis to transform the elements in ourselves that prevent us from recognizing our inter-relatedness with our difficult students, we become more prone to experiencing our students and our selfhood as interdependent and thus our processes of inner transformation and our students' transformation as likewise interdependent.

---

[11] This does not suggest that professors are not also balancing content objectives, teaching aims, purposes and other considerations that shape the post-secondary classrooms.

De Quincey’s Three Forms of Intersubjectivity

> *Instead of being lone subjects in our own life's drama, we are ‘intersubjects' created by the original worldwide web - the web of intersubjectivity woven in the Great Cosmic Drama, in the Great Unfolding of Being. (de Quincey, 2005, p. 182)*

Christian de Quincey is a theorist in the field of consciousness studies and the philosophy of mind. His more recent work focuses on legitimizing second-person forms of knowing and inquiry by arguing for fundamental shifts in our understanding of human experience and consciousness. Like Nhat Hanh and Buber, in *Radical Knowing* De Quincey presents his thesis of intersubjectivity as both the ground and precondition that human consciousness arises out from. Like Buber, he tends to emphasize the interpersonal dimension of relationship given that communication is among his chief concerns. Tracing out the philosophical and spiritual roots of intersubjectivity in his work (2005), he argues overall that it has not been given sufficient attention as a legitimate ground of knowing and path for exploring consciousness.

De Quincey (2000, 2005) distinguishes among three types of intersubjectivity, each offering an important contribution to the project of bringing forth a second-person approach to contemplative education. He derives his first meaning of intersubjectivity from the basic Cartesian worldview where “individual subjectivity ontologically precedes intersubjectivity” (2005, p. 183). Communication in intersubjectivity-1 takes place primarily through sharing language and linguistic signals. Comparable to Buber’s I-It relationship, linguistic intersubjectivity is commonly found in academic culture where the prevailing pattern is to develop one’s own unique point of view “independently” of others. This can lead to a pedagogical orientation that privileges agency, where as educators we may find ourselves siding with those students who share a similar view to us. Prone to overlooking the entangled matrix of interbeing and corresponding forms of collective intelligence, from intersubjectivity-1 we teach from our established funds of knowledge as the meeting point or center of convergence in the classroom or online learning environment.

The meaning of intersubjectivity-2 refers to the psychological dimension of intersubjectivity, which, according to De Quincey (2005), is explored in the intellectual and feeling realm of relationship through presence. De Quincey remarks that intersubjectivity-2 focuses more on the interpersonal domain of communication, but not the deeper intersubjective context of an interaction. Here, participants’ subjectivity is still ontologically prior to intersubjective encounters. For the purposes of contemplative pedagogy, intersubjectivity-2 draws upon felt-relational forms of presence, providing an important intermediate depth of intersubjective experience that is comparatively more engaged than intersubjectivity-1. Given that intersubjectivity-2 relies on personal or interpersonal presence, the educator is focused on shifting the classes’ participation into presence, but as a means for affecting their learning of the subject, not transforming their sense of self to “understand the deeper co-arising and engagement of intersubjective subjects or intersubjects” (p. 281), which is the hallmark of the third sense or “intersubjectivity-3” (2005). For De Quincey, intersubjectivity-3 involves the radical shift from separate subjects interacting psychologically to a more profound transpersonal form of interacting that is also based upon shared presence.[12] However, in this mode of intersubjectivity, our interrelatedness with another is experienced as *primary* to one's ontological constitution. For De Quincey, this deep form of intersubjectivity contains the seeds of co-creative process and "relies on co-creative nonphysical presence, bringing distinct subjects into being out of a prior matrix of relationships" (2000, p. 2).

For the project of developing intersubjective approaches to contemplative education, De Quincey's intersubjectivity-2 and -3 offer important contributions. By drawing attention to the significance of felt-relational presence, intersubjectivity-2 offers an important intermediate context that focuses on the personal dimension of learning with others. In focusing on a shared transpersonal basis of learning with intersubjectivity-3, De Quincey identifies a path to generative interactions through the vehicle of a sacred co-creative relationship where our experiences of self and the world are chiefly mediated by engaging in presence with other centers of experience (i.e., subjects). Both forms involve learning to facilitate interactions beyond De Quincey's first mode of intersubjectivity where educator and students exchange language and inform each other (intersubjectivity-1). While De Quincey locates intersubjectivity-2 interactions as arising from independent subjects, his emphasis on felt-relational presence and incorporating the psychological dimension of learning are essential in creating the conditions for safety, compassionate listening and interpersonally mediated forms of co-creativity. For intersubjectivity-3, the aim is to experience the interhuman sphere of the between as ontologically prior to our individual subjectivities. Expressed in another way, the relational context or interhuman field becomes more prominent in one's awareness than our individual sense of separateness from both one another and this interhuman sphere of the between. By aspiring to learn together as *interdependent* subjects, our very identities become involved with the co-creative processes of conversation. It is not that individual meaning is no longer important. Rather, the emphasis of intersubjectivity-3 shifts to co-creating new *shared* meaning through collective felt presence and what is emerging through the class. My understanding of this intersubjective turn is that it involves listening and speaking from a subtly different self-location that is interwoven with, rather than separate from the interhuman field that envelops the participants. From this collective shift in attention and raising of collective mindfulness, in intersubjectivity-3 students and professor are more able to collectively experience its thinking processes together, rather than (a) simply verbalizing or downloading our thoughts when communicating, which is characteristic of intersubjectivity-1 or (b) overly relying on the interpersonal qualities of intersubjective experience as is characteristic of intersubjectivity-2.

---

[12] Though De Quincey does not elaborate on how to make the shift from psychological to transpersonal modalities of intersubjectivity, my experience is that each form involves a different quality of presence and self-sense of the individuals engaging within these interactions. In other words, from intersubjectivity-2 one is still relating primarily to another as a separate self, whereas in intersubjectivity-3 one is relating to another from an interconnected sense of self that is informed by Bai's (1999) notion of a more polymorphous sense of agency that arises in part from the field of relationship that one experiences one's self co-arising with others from.

De Quincey's philosophical project lies in legitimizing second-person forms of knowing (i.e., particularly intersubjectivity-3).[13] As he points out, "we tend not to notice the second-person perspective because it is right in front of our noses every day. It is the medium in which we most naturally live" (2005, p. 178). However, it is also a medium that is most taken for granted or that we are most unconscious of, too, hence the importance of his three definitions and emphasis on presence, shared meaning, relationality and collective ontology as keys to deepen and refine our practice of second-person forms of knowing and being. As De Quincey's three definitions arc towards an increased degree or levels of intersubjective depth, they mark a progression from separate individuals interacting towards a more unitive and interwoven movement of shared consciousness. The shifts from intersubjectivity-1 to -3 represent not only new possibilities for co-creative manifestation within contemplative classroom settings, but make specific aspects of intersubjectivity (i.e., communion, co-presence, shared meaning) progressively more prominent than the individual agency, presence and personal meaning of learners who are co-participating in the intersubjective event—a change in pedagogical approach that has yet to be accounted for within the existing contemplative education literature.

Wilber's Five Dimensions of Intersubjectivity

Over the past three decades, American philosopher Ken Wilber has developed a transdisciplinary and transcultural integral philosophy that draws from a wide cross-section of perspectives, methodologies and paradigms across a breadth of fields and traditions. Wilber's recent AQAL approach[14] (2006) serves as a model through which theorists and practitioners can explore an integrally-informed perspective to their work within their respective fields of knowledge. Integral theorist Sean Hargens (2001) has identified at least five types of intersubjectivity throughout Wilber's writings (1996, 1997, 2006). In contrast to De Quincey's three definitions, which address instances of communication and were developed out of his research in academic philosophy and consciousness studies, Hargens' account of Wilber's "types" of intersubjectivity are culled from a comprehensive review of Wilber's writings and are presented in terms that are internal to Wilber's integral paradigm. In this regard, Hargens provides a summary of Wilber's broad research into intersubjectivity by highlighting five distinct forms that intersubjectivity takes within Wilber's integral model.

The first form is "intersubjectivity-as-spirit" (Hargens, 2001, p. 13) with spirit being in this context, the ontologically prior, always present background or non-dual ground of being (Wilber, 2006). This meaning of intersubjectivity adds an important distinction to Nhat Hanh's account of interbeing and De Quincey's intersubjectivity-3. Where interbeing refers to the co-arising constituents and elements of intersubjective experience, intersubjectivity-as-*spirit* identifies the deeper undivided formless source of consciousness that our experience of interbeing arises in and out of. Intersubjectivity-as-spirit offers an important transpersonal referent to the realm of the absolute within each intersubjective experience, signaling the non-dual space or root context out of which our experience of interbeing arises. This distinction also becomes significant within De Quincey's intersubjectivity-3 insofar as it draws our attention to a dimension of awareness that is not mediated by second-person forms of knowing and being. While certain educators[15] may aspire to engage with their students in a manner where second-person forms of knowing are informed by non-dual awareness in the classroom, students unacquainted with non-dual experience will require being introduced to it through some form of pointing out instructions.[16]

---

[13] De Quincey does not address ways in which first and third-person forms of knowing might support his project of validating second-person forms of knowing. Instead, he tends to downplay third-person perspectives (2005), by claiming we need to set up experiments to induce the illusion of the separation between observer and observed "this stepping-back allows us to notice the third-person in action because it is not "normal"" (p. 178). He also downplays the role of first-person perspectives as being dependent on withdrawing from the world as in the case of meditation.

[14] AQAL is short form for quadrants, levels, lines, states and types—five key features of Wilber's (2006) integral framework.

The second form "intersubjectivity-as-context" (Hargens, 2001, p. 13) refers to the structural elements of intersubjectivity, which for Wilber is located within the lower left of his four quadrants (see Figure 1 below).[17] Hargens (2001, p. 13) identifies the intersubjective matrix of contexts as "physical laws, morphic fields, linguistic, moral, cultural, biological, and aesthetic structures." Hargens does not elaborate on how other structural elements from other zones[18] might influence our understanding of intersubjectivity. Such a consideration would involve taking into account the structural influences of Wilber's account of developmental lines,[19] where personal and interpersonal capacities, skills and intelligences influence the possibilities of specific intersubjective engagements between teacher and students or classroom life.

Intersubjectivity-as-context viewed in this light highlights developmental issues educators would benefit from considering in their work with contemplative education. Further research would need to establish which lines and levels[20] of development or capacities have a bearing on contemplative processes of education (i.e. stages of insight or concentration). Attention would also need to address the misconceptions around conflating *levels* of development with *states*[21] and *state-stages*[22] (Wilber, 2006) and to determine which contemplative practices are developmentally-contingent[23] and if so, in what ways. Both Hargens (p. 15) and Wilber (2006) point out that these background structures constitute the subject before experience and are therefore not accessible to direct experiential knowing. Given that not all students will be at the same contemplative capacity as their teachers and conversely in certain situations, intersubjectivity-as-context is a helpful consideration in refining our approaches to contemplative pedagogy.

---

[15] Though such an approach to second-person contemplative education will be unsuitable for many educators in higher education classrooms, it has been my experience that learning to locate the non-dual quality of unconditioned experience firstly in one's own experience as an educator and secondly (where appropriate) within one's classroom interactions will invite a beneficial quality of shared learning and communication.

[16] I realize that educators also unacquainted with the non-dual experience will also require being introduced to it. It is important to note that according to Buddhist traditions, one does not, technically speaking, "have" a non-dual experience, for this would be enacting a subtle dualism. Rather, nonduality is viewed as a radical realization that requires ongoing meditative practice to stabilize as a view in one's everyday consciousness. In spite of non-duality being traditionally conceived as the essential condition of enlightened consciousness, in recent years practitioners have moved towards adapting pointing out instructions to give people a taste of this unconditioned experience through various intersubjective methodologies such as Genpo Roshi's *Big Mind, Big Heart*, Peter Fenner's *Radiant Mind,* Andrew Cohen's *Enlightened Communication* among others.

[17] Alternatively, in the language of his 8 primordial perspectives (2006), intersubjectivity-as-context would be in zone four within the lower left quadrant.

[18] The eight zones refer to the inside and outside of Wilber's four quadrants.

[19] In educational circles, developmental lines are referred to as *intelligences* made known by Howard Gardner (e.g., kinesthetic intelligence, musical intelligence, emotional intelligence, cognitive intelligence, etc.). Picking up where Gardner left off, Wilber (2006) outlined at least two dozen of these lines as a key dimension of his integral AQAL theory.

[20] *Levels* of consciousness are abstract measures that represent fluid yet qualitatively distinct classes of recurrent patterns within Wilber's construct of developmental lines. Some examples of levels include egocentric, ethnocentric and worldcentric (Rentschler, 2006, p. 20).

The third type, "intersubjectivity-as-resonance" (2001, p. 14), arises out of mutuality of presence shared between people, reflecting De Quincey's intersubjectivity-2 and -3. Hargens elaborates upon *worldspaces* and *worldviews* as contexts out of which the resonance takes place. In terms of worldspaces, Hargens (p. 14) introduces the distinction of *ontological* resonance between subjects and for worldviews and *epistemological* resonance between subjects who share a common stage of psychological development. Both of these terms attempt to locate where intersubjective resonance is taking place within Wilber's AQAL model. However, these distinctions become problematic in practice. For example, epistemological resonance between two subjects does not necessarily presuppose a common level of psychological development. Hargens' claim that ontological resonance is contingent upon a shared worldspace is helpful in a broad sense and resembles De Quincey's ontological definition of intersubjectivity. However, once again identifying the specific shared worldspace that resonance is taking place within Wilber's integral system or any developmentalist's model is a speculative matter, even when subjects are in broad agreement with the interpretive frameworks being applied. What would be helpful for contemplative educators interested in exploring second-person modalities of contemplative learning is a more nuanced heuristic to differentiate between the different forms of resonance. Such a heuristic would not need to be developmentally contingent, but could rather represent the possible stage-processes that groups go through or the characteristic forms of resonance that distinguish different intersubjective contexts such as De Quincey's -1, -2 and -3 in classroom settings. Resonance is often a marker of mutual understanding. However, Hargen's (2001) portrayal of Wilber's intersubjectivity-as-resonance traces each form of resonance back to Wilber's AQAL model. Again, I am not convinced this captures the significant intersubjective qualities of resonance that would shed further light into the nature of different encounter(s), particularly within classroom settings where learning is the underlying objective.

---

[21] *States of consciousness are* temporary (from a few minutes to several days) and range considerably from ordinary to peak experiences including meditative states (induced by contemplation and meditation) and altered states (induced by psychedelic substances, demanding physical exercise, athletics, etc.).

[22] Rentschler (2006) defines *state-stages* as "states that unfold in a sequence, usually as the result of training. State-stages generally move from gross experience, to subtle experience, to causal experience, to nondual" (p. 30).

[23] This article will not address developmental considerations in educators, students or classroom life as this might pertain to contemplative education or intersubjective approaches. This is due in part to the sheer complexity of the subject but also the lack of established research in understanding how developmental awareness plays out experientially given the invisibility of these background structures and lack of clarity in understanding to what extent and precisely how successful applications of contemplative education are contingent or helpfully guided by such awareness.

The fourth type of “intersubjectivity-as-relationship” (p. 14) offers a further explication of types of relationship. Hargens offers two important sub-distinctions of *relationship-as-solidarity* (p. 14), where the basis of intersubjective interaction lies in the shared values, ethnicity, gender, interests and so on, as well as *relationship-as-difference* (p. 14), where one relates to another subject and makes the effort to reach across differences in the interest of arriving at a fuller understanding of one another or a given issue. This latter distinction has important ramifications in educational settings, in that the cultivation of this form of intersubjectivity flourishes when collaboration and shared meaning across difference take place, but also perhaps more importantly, enabling both educator and students to recognize one’s self in difference. Relationship-as-difference follows on Nhat Hanh’s account of interbeing, where the point of resistance in whatever we happen to disagree with is connected in some way to the point we are advocating for. While the deeper interwoven pattern that connects these points may not be initially evident to our students or us, this principle highlights the importance of the latent potential of intersubjectivity as a robust container for the transmutation of our understanding of conflicting and contradictory views.

The last category, “intersubjectivity-as-phenomenology,” touches on elements of De Quincey’s intersubjectivity-2 and -3 by focusing on the felt experience of intersubjectivity. Hargens associates the felt-sense with the previous three types of intersubjectivity: *spirit, relationship and resonance*. The felt-sense of spirit has an important implication in terms of deeper shifts in states of consciousness[24] (Wilber, 2006) that become more pronounced within intersubjective-3 engagements. Given the potential for deeper states in providing an ontological window into our deeper motivations and shared meaning (Wilber, 2006), the temporary emergence of transcendent states of consciousness and their potential to evoke deep feelings of sacred connection with life and the cosmos make the felt-sense of spirit a significant dimension of intersubjectivity that merits further exploration, particularly in the context of contemplative educational pedagogies. The felt-sense within intersubjectivity as relationship offers a widely subscribed to moral compass to navigate what educational philosopher Nel Noddings (1984) defines as an ethic of caring, which centralizes love in the particular, reciprocal, and personal forms of classroom relationship.

Recontextualizing Intersubjectivity Within Broader Epistemological Horizons

This article has attempted to convey the importance of second-person contemplative classroom processes, which draw upon the depth of shared relations and quality of intersubjective experience, expanding our scope of contemplative practice to include and build upon key insights of intersubjective theory is a natural next step. With the development of second-person approaches to contemplative pedagogy, as educators our approaches to classroom learning will increasingly ask for more distinct shared mode(s) of participation with our students—including key distinctions that have been outlined and developed throughout this paper.

---

[24] Wilber (2006) outlines five primary states of consciousness in his AQAL framework: gross waking states (everyday); subtle states; causal formless states; witnessing states and non-dual awareness. States of consciousness range considerably from ordinary to supernormal varieties. Similar to meditative states, intersubjectivity-3 engagements, varieties of Buber’s notion of supreme meeting and other sacred intersubjective encounters tend to evoke deeper states of consciousness.

Rather than proclaim the strengths of intersubjectivity and problematize other ways of knowing,[25] I believe a more fruitful course forward involves *first* establishing the contributions of intersubjectivity theory that could be helpful in developing a second-person contemplative educational approach as I have attempted to convey by highlighting features of each intersubjective theorist's work above. *Second*, as I address in the next section, I believe it is important to contextualize intersubjectivity as a distinct perspective alongside other primary epistemological perspectives—i.e., subjectivity, objectivity and inter-objectivity. However, in doing this it is crucial to acknowledge that intersubjectivity is more than an epistemological perspective with distinct processes and dimensions of knowing.

As I have pointed out in the above sections, intersubjectivity has an ontological dimension (Buber, 1965; Roy, 2006) with both an interpersonal (Nhat Hanh, 2000; De Quincey, 2000; Wilber, 2000) and transpersonal relational significance (Buber; 1965; De Quincey, 2005). Intersubjectivity is also a conversational field of inquiry (De Quincey, 2005) that is contingent upon second-person contextual structures (Hargens, 2001) and interwoven relational elements of self and other (Nhat Hanh, 2000) that influence any given interhuman encounter. Finally, intersubjectivity also has a phenomenological (Wilber, 2006) dimension that is experienced through co-presence (De Quincey, 2005) and resonance (Hargens, 2001) among other characteristics outlined above, as well as beyond these four accounts.[26]

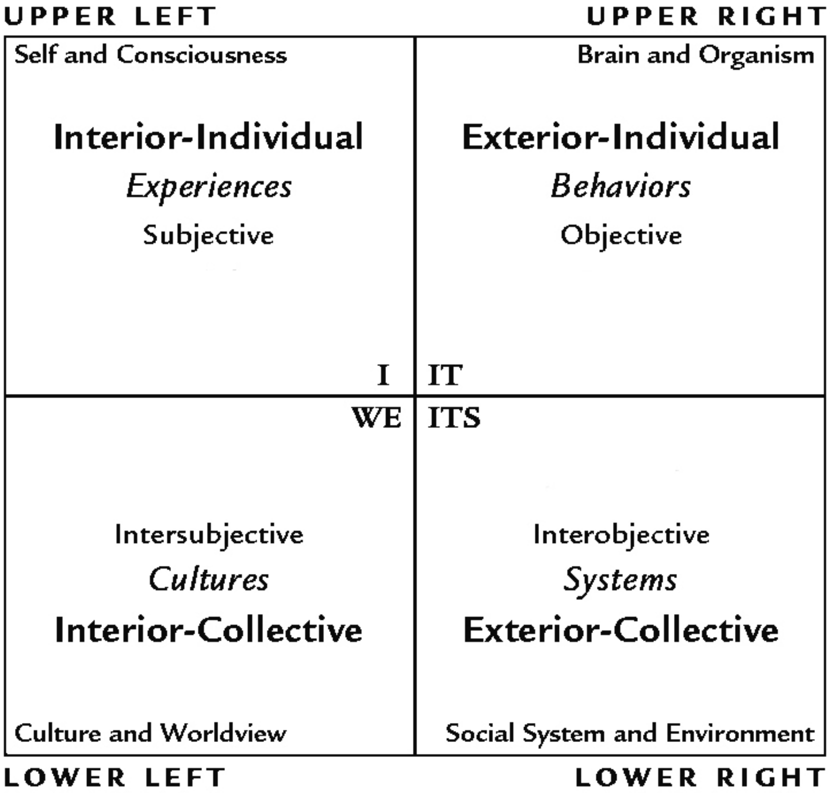
Keeping in mind these and other richly textured facets of intersubjectivity as we locate it heuristically as an epistemological perspective, we will then embark on our *third* step in considering what intersubjectivity might bring to the project of establishing second-person modes of contemplative education. In addition to preparing the theoretical terrain for such work, ongoing experimentation will be needed to gain a more direct understanding of the distinctive qualities, meaning and significance of intersubjectivity as a contemplative form of knowing and learning in classroom settings. Explorations of this nature could help identify a more nuanced and comprehensive understanding of second-person contemplative pedagogical approaches, experiences and their relevance for educator and students both inside and outside the classroom.

---

[25] As a result of the traditional marginalization or omission of intersubjectivity, problematizing first-person subjective or third-person objective onto-epistemological habits may have been an appropriate stance to take in certain debates. My hope is that we can turn the conversation towards a post-Cartesian inquiry that honors both *limiting* the problematic features and *including* the respective gifts of each perspective and way of knowing. By sufficiently differentiating and untangling these three epistemological forms in the context of our classroom pedagogies, we can then move towards a stronger integration of each, with further consideration for how first-person and third-person contemplative pedagogies might support the development of second-person approaches. Given that the deeper forms of second-person engagement are partly contingent upon first-person contemplative practice, there is value in proceeding with a more integral orientation here.

[26] In introducing the related yet distinct elements, terminology and conceptions of intersubjectivity, this article does not go into depth with either comparing or contrasting each theorist's perspective of the ontological nature of intersubjective forms of communicating, relating, communion, agency or other modalities relevant to teaching across the four accounts. Largely this is due to the limitations of space and scope of this particular project.

Returning to the first objective, to help establish intersubjectivity as a key epistemological perspective within contemporary teaching and learning practices, there is value in consulting with a more encompassing epistemological map that differentiates intersubjectivity from its neighboring perspectives. Wilber (2000) provides us with such a map in his account of the four quadrants in figure 1 below.



UPPER LEFT
UPPER RIGHT
Self and Consciousness
Brain and Organism
Interior-Individual
Experiences
Subjective
Exterior-Individual
Behaviors
Objective
I
IT
WE
ITS
Intersubjective
Cultures
Interior-Collective
Interobjective
Systems
Exterior-Collective
Culture and Worldview
Social System and Environment
LOWER LEFT
LOWER RIGHT

Figure 1. Wilber's (2000) Four Quadrants

Wilber's quadrants locate four primary perspective-dimensions of reality that co-arise: subjective (i.e., the interior of an individual), intersubjective (i.e., the interior of a collective), objective (i.e., the exterior of an individual) and inter-objective (i.e., the exterior of a collective). The quadrants essentially represent the broad range of interior and exterior perspectives within individuals and collectives. Each specific quadrant is a referent for one of these four primordial perspectives.

Wilber's four quadrants are useful to our purposes in several ways. By distinguishing each epistemological perspective in addition to their validity claims and criteria, we are in a better position to untangle methodological issues that invariably arise in our research. For example, if we are tacitly or unknowingly employing "objective" validity criteria to understand a contested intersubjective experience as a way of inquiring into whether it is true, we are proceeding incoherently. Insofar as the intersubjective experience we are investigating is contingent upon mutual understanding, shared resonance and co-presence, understanding the validity of the experience becomes an *interpretive* exercise, not an empirical one. By conflating the methods and measures of validity across different epistemological perspectives, the language and validity criteria naturally become muddled and academic turf wars ensue—hence Wilber's map helps locate and defend the partial merits of each first-, second-, third- and third-person plural perspective of knowing and their accompanying methodologies. In this way, Wilber's quadrants help prevent colonization from other perspectives or privileging one form of knowing to the exclusion or diminishment of another.

Given that contemplative education draws from the perennial world wisdom traditions (i.e., whose knowledge horizons are generally located in the left hand quadrants—particularly upper left) and recent scientific research (i.e., that is generally located in the right hand quadrants), contemplative education research in academic settings is attempting to occupy an uncomfortable position or movement between the more objective sciences and the more subjective and intersubjective interpretive social sciences. As a case in point, Wilber's quadrants offer a helpful augmentation of Roth's (2006) binary contemplative framework that differentiates first and third person methods. In turn, the quadrants offer us a more comprehensive epistemological map to distinguish and validate intersubjectivity as one of four broad perspectives of contemplative knowing. Differentiating intersubjectivity from its neighboring perspectives ensures that educational researchers utilize the appropriate truth claims and methods[27] required to coherently work with intersubjective approaches to contemplative education, as each perspective carries with it inherent methods for experiencing and interpreting the world (Wilber, 2006).

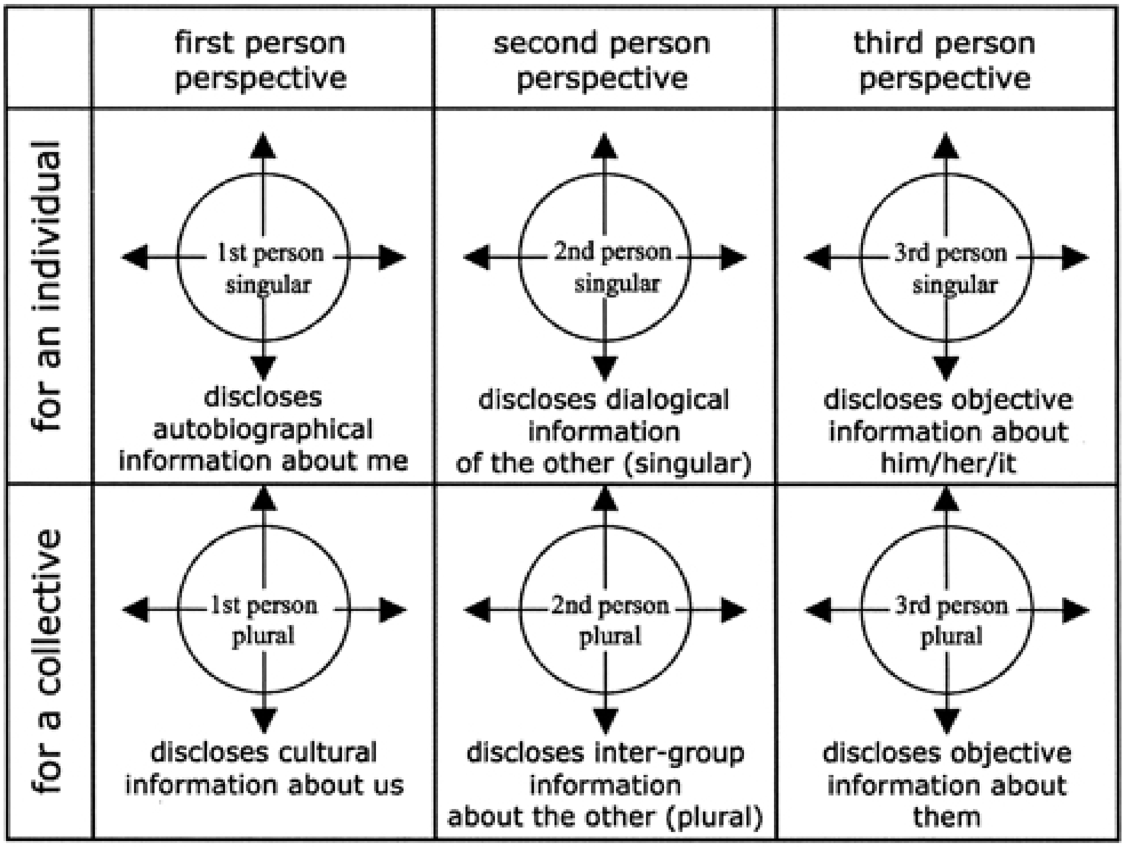
Nevertheless, while Wilber's quadrants are helpful in broadly differentiating these perspectives, they have the limiting condition of offering a more "structural approach and interpretation of reality" (Roy, 2006) than a process approach.[28] Roy (2006, p. 119) makes a helpful distinction between "epistemological categories of knowing" which help us apprehend reality and the related yet distinct "ontological ways of understanding" that are gleaned through deeper modes of consciousness and being. In this regard, Wilber's quadrants do not satisfactorily account for the ontological ways of understanding intersubjective reality that this article attempts to convey. Additionally, neither do Wilber's quadrants nor his eight native perspectives (2006) satisfactorily locate the second-person perspective or differentiate singular or plural forms of second-person knowing.[29] Integral theorist Mark Edwards (2005) has advanced a more nuanced account of intersubjectivity in his rendering of the three basic first-, second- and third-person epistemological perspectives.

---

[27] Intersubjective truth claims from the second-person perspective involve knowledge developed by a group of inquirers about some theme, issue or domain of inquiry. This second-person knowledge is concerned with the shared, intersubjective processes which groups of people explore when they meet in the context of discussion, dialogue, presencing and other inquiry formats. Epistemological validity in the intersubjective deals more with interpretivistic methods or procedures for conducting inquiry that are grounded in the second-person world-space of shared experience.

[28] Roy derives her process-model in part from process-theory, which is informed by intersubjective theory to the extent that a process-model is contingent upon a relational understanding of reality as comprised fundamentally of processes rather than things.

[29] Within Wilber's eight native perspectives (2006), he identifies the interior and exterior of the intersubjective by noting first-person and third-person accounts of *second-person reality*. However, he does not distinguish *a second-person perspective* or differentiate between the singular and plural forms of *second-person knowing* in his mapping out of the eight native perspectives.



first person perspective
second person perspective
third person perspective
for an individual
1st person singular
discloses autobiographical information about me
2nd person singular
discloses dialogical information of the other (singular)
3rd person singular
discloses objective information about him/her/it
for a collective
1st person plural
discloses cultural information about us
2nd person plural
discloses inter-group information about the other (plural)
3rd person plural
discloses objective information about them

Figure 2. Edwards' (2005, p. 280) Account of First-, Second- and Third-person Perspectives

By framing Edwards' epistemological map as an appendage to Wilber's quadrants,[30] in addition to legitimizing the intersubjective dimension of reality, we can now honor the second-person perspective more fully by distinguishing between second-person singular and plural varieties. In the context of contemplative education, Edwards' map becomes particularly useful in distinguishing intersubjective reality from the distinct second-person perspectives that co-arise within it. Given that the field of contemplative education is in its formative stages, legitimizing and further differentiating (a) second-person perspective(s), (b) intersubjective reality and (c) the neighboring first-person and third-person primary perspectives raises important foundational clarifications and questions in terms of how we proceed to develop the field of contemplative education. By differentiating and including single and plural varieties of second-person pedagogies alongside their first- or third-person counterparts, we can begin to more clearly demarcate the epistemological terrain underlying these different pedagogical orientations. As an example, without distinguishing second-person forms of contemplative pedagogy, deeper forms of intersubjective collective knowing may remain dormant, obscured or completely hidden from our awareness as educators. Acknowledging second-person forms of contemplative pedagogy will help locate and map out the respective depths of intersubjective reality, as well as deeper forms of intersubjective knowing than the conventional varieties that prevail at the physical-material and conceptual-mental levels of existence (i.e., intersubjectivy-1). By mapping out the different regions of intersubjective experience, further interpretive validity criteria can be established to determine to what extent if at all we are enacting distinct senses/experiences of intersubjectivity. Additionally, as second-person forms of contemplative education is a broad distinction, there is room for including the intersubjective insights and distinctions of Buber, Hahn, De Quincey, Wilber and others who have shed helpful light onto different contours and dimensions of intersubjectivity.

---

[30] For the purposes of my project in *legitimizing* and further developing second-person forms of contemplative education, I have drawn on Wilber's (2000, Figure 1) and Edward's (2005, Figure 2) frameworks as a way of establishing how intersubjective/second-person approaches to contemplative education are situated, *epistemologically-speaking*. This work is consistent with and in several cases informs the contemplative pedagogy heuristics that Roth (2006) and Sarath (2006; 2009) have developed in framing their approaches to contemplative education. As this article explores, specific shared experiences within the intersubjective/second-person domain of classroom life are *qualitatively distinct* from the modes of knowing and learning that emerge from the private-subjective first-person and public-objective third-person domains, hence the importance of distinguishing them. Some readers may find the technical presentation of Wilber's and Edward's frameworks to be incongruous or unsuitable to the above inquiry into the four conceptions of intersubjectivity. However, my intention in utilizing their frameworks is to provide further heuristic and conceptual clarification by locating these four accounts *epistemologically,* not to suggest that Wilber's or Edward's frameworks are in any way necessary to experience the different aspects of intersubjectivity explored above.

Establishing Critical Second-Person Forms of Contemplative Education

In the September 2006 contemplative education issue of the *Teachers College Record*, alongside Roth's (2006) call for developing pedagogies that support students' investigation of contemplative states of consciousness through first- and third-person approaches, Sarath (2006) briefly comments on second-person approaches of contemplative practices as a "movement from education's conventional focus on third-person knowledge toward a more inclusive approach that also includes second- and first-person approaches to knowledge" (p. 1817). He locates second-person educational approaches along an integrated continuum of first-person and third-person knowing and inquiry and points out that any subject can be studied through each perspective. Sarath describes his experiences with second-person approaches to contemplative education:

> I move into the intersubjective domain with exercises done in small groups that invite students to share and connect deeply with others. Common examples are exercises in which students reflect on, identify, and discuss inner feelings, behavior patterns, frustrations, and sources of fulfillment. Community based learning is another example of intersubjective learning that can both thrive within and feedback to strengthen a creativity and consciousness framework. (Sarath, 2006, p. 1836)

On the whole, Sarath offers brief third-person descriptions of the content of second-person interactions in the classroom, however he does not comment further on the process of second-person approaches to education other than it is "more process-oriented" (p. 1817) than first-person or third-person forms. Roth, on the other hand, advocates for *critical* first-person and third-person approaches to contemplative education.

> By critical, we mean that students would be encouraged to engage directly with these techniques without prior commitment to their efficacy. They would then step back and appraise their experiences to gain a deeper appreciation of their meaning and significance. Students will learn to identify contemplative states of consciousness both as objects and subjects of study. (Roth, 2006, p. 1788)

Roth does not address second-person approaches to contemplative education in this article[31] or in any of his published work to date. Given the academic heritage of valuing third-person forms of learning at the expense of other forms, one of Roth's key points of focus in this paper is to advocate for critical first-person methods of contemplative education.

Building from where Sarath and Roth left off, I am advocating for developing second-person methods of contemplative education that take into account the above perspectives on intersubjectivity. The interhuman encounter, the interbeing of students and educator, the shared presence of intersubjectivity-2 and -3 and the intersubjectivity-as-spirit and –resonance in the class field among other intersubjective distinctions further explicate the contemplative dimensions of this broader project. To the extent that not all forms of second-person education are oriented towards the depths of learning and co-creativity that the application of the work of the above theorists entails, there is a need for distinguishing critical second-person forms of contemplative education and pedagogy as a means for establishing a new theoretical domain of inquiry within the field. Additionally, such an initiative will also help students and faculty identify a broader spectrum[32] of contemplative pedagogy than if they had been primarily exploring first- and third-person approaches as advocated by Roth's (2006) framework.

Consider the following description of an intersubjective experience, which exemplifies a second-person contemplative encounter:

> There's nothing like the joy, freedom, and deep intimacy of intersubjective space … our shared and passionate attention to what wants to come into being didn't diminish, but rather it enhanced our senses, receptivity, deep intuition, as well as the faculties of thinking together, building on each other's ideas and inspirations, and profoundly appreciating the value of everyone's perspective. They became notes in a larger harmony that has a message that we can receive only when the chatter of the conditioned mind stops, and we share with one another what is perceived in that precious state. (Por, 2004, n.p.)

I believe Por's brief description conveys key aspects of intersubjective space that arise when the conditions for second-person education are present in that it draws attention to a distinct quality of feelings and attention, mode of shared thinking, a state of consciousness and way of being together with others in conversation. How might our current approaches to contemplative education facilitate intersubjective experience(s) for learners along these lines in a manner that serve the course's pedagogical and content goals?

---

[31] I will speculate that this omission is because second-person forms of inquiry are not an important focus of the proposed contemplative studies concentration at Brown University—the subject of Roth's (2006) article.

[32] A broader spectrum would not leave out second-person approaches, but include an array of first-, second- and third-person forms of contemplative study.

As an educator, my urgent felt-sense of the call for developing intersubjective methods of contemplative education arises in response to having witnessed and endured countless hours of classroom life shaped by "the most minimal sense of we" possible" (Balder, 2007):

> It is a functional "we" designed to serve the interests of private selves. There are, of course, advantages to our modern self-centered "public sphere," allowing for freedoms that were not possible in the mythic membership societies of the past, but these freedoms come at a cost. The self, in winning and maintaining its independence, is cut off from the whole in fundamental ways, which are frequently difficult to identify. (Balder, 2007, p. 1)

As a basis for fostering an *optimal "we,"* critical second-person contemplative educational approaches work with varied processes of collective contemplation and inquiry into the class subject that are shaped by subtle and emergent dimensions of intersubjective experiences. What discoveries await a graduate seminar or cohort group where conversations are oriented from a collective investment in speaking and listening that is attentive to what is emerging from the intersubjective worldspace of the class field of learning? By experimenting with second-person approaches to contemplative education that engage students in intersubjective forms of learning, thinking and being together introduced from the distinctions brought forth in this paper, as educators we bring long awaited attention to the deeper intersubjective spaces that await us and our students in daily classroom life.

Closing Remarks

To briefly summarize, Buber offers a helpful compass to orient second-person contemplative interactions with his distinction of the primacy of intersubjective learning processes unfolding from the interhuman sphere of the between, which establishes a transpersonal context and process from which to orient classroom inquiry. Nhat Hanh's description of interbeing conveys rich insight into the ground and fabric of intersubjective relationality, helping foster an inclusive and deepened ethic of responsibility for the intersubjective encounter with "other", whether our students, a differing opinion, perspective or some element of the cosmos one has neglected to include in our picture of inquiry and communication. De Quincey's three modes of intersubjectivity, particularly intersubjectivity-2 and -3, build on his epistemology of presence, relationship and collective co-creativity. Signifying different depths of intersubjective knowing, intersubjectivity -2 and -3 offer helpful markers of the respective levels of epistemology and reality that second-person experiences of contemplative education uncover. Wilber's intersubjectivity-as-spirit provides a referent to the deeper source of our human experience, which re-situates second-person modes of engagement within a greater emergent cosmology. Intersubjectivity-as-resonance in the context of our modes of knowing and being as well as intersubjectivity-as-relationship (i.e., relationship as similarity and difference) and the felt-sense in intersubjectivity-as-phenomenology also offer key distinctions to further explore in our critical contemplative classroom experiments with second-person education.

Alongside critical first-person and third-person contemplative methods, the related yet varied assortment of intersubjective accounts culled from the literature on intersubjective theory outline key aspects of the epistemological territory for developing second-person forms of contemplative learning and knowing together in the classroom. The purpose of this article is not so much to show how these distinctions improve upon existing second-person contemplative pedagogical methods, as there are presently few to draw from, but more to illustrate the need for a subfield of inquiry to establish and inspire the future development of second-person pedagogical approaches to contemplative education.

In framing these interpersonal methods pedagogically as “inter-subjects” of study from critical second-person perspectives that arise with post-Cartesian first- and third-person perspectives, my intent has been to cast new light on collective contemplative practice by recontextualizing this body of work within a more comprehensive epistemological framework and domain of inquiry within the emerging field of contemplative education. By presenting key elements from these four accounts of intersubjectivity, then introducing Wilber and Edwards’ epistemological maps to reinforce and advocate for the inclusion of these accounts within a broader critical framework of second-person education, my hope is this contribution will provide scholar-practitioners with useful distinctions to further differentiate and build upon second-person approaches to contemplative education.

The Status and Relevance of Phenomenology for Integral Research: Or Why Phenomenology is More and Different than an “Upper Left” or “Zone #1” Affair

Wendelin M. Küpers

Abstract: The specific treatment that Ken Wilber gives phenomenology in his model of integral theory requires a critical investigation. According to Wilber's model, different methodologies are situated in distinct quadrants or "domains of knowing," namely the subjective, objective, intersubjective and interobjective domains, labeled by their position in the model's matrix illustration, upper left, upper right, lower left, lower right. In this model, phenomenology is isolated in the UL quadrant, and even more specifically as the inside perspective of this subjective domain. What this means is that, according to Wilber's classification, phenomenology is an exclusive, rather than inclusive, approach that limits its field of inquiry and therefore its range of knowing also to an inside exploration of the subjective.

In contrast to this positioning, a critical reflection on the current status and usage of phenomenology in integral theory is provided. The goal of this undertaking is to show that phenomenology – particularly in its more advanced forms – is more and different than something to put merely into “upper left” quadrant or to understand only as a “Zone 1” affair suggested in the conventional integral model.

In the first part the paper outlines an introductory understanding and examines classical (Husserlian) phenomenology as well as illustrates some of its limitations. Based on various critiques and further developments of phenomenology, the status and usage of phenomenology in integral (AQAL) theory is discussed critically. Particularly, this concerns the ordering of phenomenology into a separate realm or zone, the status of consciousness, including the debate related to its structure and states, and inter-subjective dimensions as well as the relation to contemplation and meditation. In a second part the paper introduces the more advanced phenomenology of Merleau-Ponty that overcomes the limitations of the previous versions of phenomenology. Advanced phenomenology entails a strong proto-integral potential and as such contributes to compensating for some of the weaknesses and limitations of integral theory.

Furthermore, a third part proposes that such advanced phenomenology provides the foundations for an “adequate phenomenology” in integral research. Based on the specific ontological, epistemological, and methodological considerations, this final part and the conclusion outline some perspectives on what is called integral “pheno-practice.” The explicated criticism and the proposed pheno-practical approach might enrich integral research, improve its theory building and empirical testing by offering perspectives of a more inclusive, coherent and relevant nexus of ideas and possibilities for integrative theory and practice.

Keywords: Adequate phenomenology, integral theory, Merleau-Ponty, phenomenology.

Introduction

Following multiple historical predecessors and developed and promoted inside and outside academia by avant-garde thinkers like Jean Gebser, Roy Bhaskar, Ervin Laszlo, Edgar Morin, Basarab Nicolescu and Ken Wilber, integral approaches have emerged responding to different contemporary challenges. In a way the emerging revival and further development of integralism manifests and provides a systematic and systemic response and guide to the complex environmental, economic, societal, religious, political, educational, as well as scientific crises we intensifying face individually and collectively. Among other aspirations integral orientations and theoretical practices attempt to reach a required synthesis grasping the major insights of pre-modern, modern and post-modern worldviews and re-integrating modern differentiation between science, arts and spirituality as the three major realms of human beings' expression and construction of reality.

In this context, the all-encompassing but difference-sensible integral thinking and theory of Ken Wilber and corresponding research inspired by it, represents one of the most sophisticated and advanced integral philosophies for understanding and dealing with the problems and potentials not only for current but also future realities. Moreover, it provides a well-founded base for a much needed integral science, which allows not only including, but transcending conventional research orientations in a coherent and adequate way. Integral theory – as developed by Wilber – has already achieved important insights and results as well as found extending developments, refinements and practices. However, what is necessary is furthering and deepening a critical appraisal and evaluations of integral theory and practice. Appreciating the tremendous achievement of integral research to date, the following criticism tries to contribute to a specific advancement and theory building. Accordingly, the following paper – and research initiative which may be inspired by this – tries to provide a constructive critique. In particular this analysis concerns the status and usage of phenomenology in integral theorizing.

Generally, phenomenology is discernible as a specific style and "movement of thought" (Merleau-Ponty, 1962: xxi). It is characterized by a flexible and vivid way of inquiry, as it takes different directions, tries out continuously new ways of reasoning. Thus, it approaches the experienced phenomena in question and its various and inexhaustible dimensions of meaning and ambiguities perspectively. Therefore, phenomenology can be seen as an attempt to understand what experience is and means, better to say a formalized account of conscious experience and its implications.

However, what is called phenomenology is not a rigid school or uniform philosophic discipline with an undisputed set of dogmas. Rather there is a great diversity in various points of view of thinkers and approaches who and which could be classified under the general rubric of phenomenology. Consequently, as a philosophical movement, phenomenology is marked by a variety of different forms, themes, ideas, problems, and issues and further developments and variations. Therefore, the horizon of phenomenology cannot be taken in at a single glance or framed as one united school (Embree, 1997; Moran, 2000; Spiegelberg, 1982; Stewart & Mickunas, 1990). Based on outlining some selective but important issues out of the diverse scope, the following will argue that the status of phenomenology in integral theorizing needs to be rethought and extended for gaining a more adequate and comprehensive understanding.

Especially it will be shown that as a methodology phenomenology is more and different than an upper left or Zone #1 affair, as it is modeled in hitherto existing integral theory and methodology.[1]

After introducing specific ontological and epistemological positions and limitations as well as discussing criticism of classical phenomenology, further developments and refinements are briefly presented. Based on this introductory understanding the status and usage of phenomenology in integral research will be problematized critically. In a second part, then the advanced phenomenology of Merleau-Ponty will be presented as a proto-integral philosophy and finally perspectives of an adequate phenomenology and an integral pheno-practice are outlined.

All in all, this article proposes that a more complete accommodation of an adequately understood phenomenological science within integral theory building and integral research development opens up a more enriched and coherent system of enlightening ideas and relevant fields for its applications.

Part I: Understanding Phenomenology

What the following attempts to convey is an introductory understanding of phenomenology and its relationship to integral theory by indicating to some of its central themes, methodologies and applications. It would be beyond the scope of this article to describe phenomenology in a comprehensive way. The aim will be to show the relevance and potency of phenomenology for advancing a more integral research and practice.

In general, phenomenology represents a philosophical discipline that has been central to the tradition of continental European philosophy throughout the 20th century and still provides a relevant contemporary purview (see e.g., Hammond et al., 1995; Macann, 1993). Literally, phenomenology is the study of phenomena: appearances of things, specifically things as they appear in human experience. Thus, it concerns ways that humans experience phenomena, particularly the experientially realized meanings things have for them. Therefore the call *to the things themselves* (Zu den Sachen selbst) as they are given in experience marks in a nutshell is the program of phenomenology. However, this call is not a demand for a “realism,” because the things at stake are the acts of consciousness and the objective entities that are constituted in them, both forming together the realm of the phenomena. As its name connotes, phenomenology is, fundamentally, a philosophy which attends to *phenomena*. The term *phenomeno-logy* is derived from the two Greek words *phainomenon* (an “appearance”) and *logos* (reason or word). Accordingly, phenomenology is a reasoned inquiry: a method of scientific philosophy in general which tries to discover the essences of appearances which are anything which human beings can become conscious. More precisely the word *phenomenon* means *that which reveals itself*. Therefore, phenomenology refers in the more refined way of Heidegger´s ontology to the attempt to let the thing speak for itself, specifically: “to let that which shows itself be seen from itself in the very way which it shows itself from itself” (Heidegger, 1962, p. 58).

---

[1] Wilber (2006) differentiates eight complementary perspectives or hori-zones whose paradigms and methodologies are used to enact, disclose, and bring forth valid data for any occasion within a community of the adequate. Phenomenology is put with introspection into Zone #1 within the Upper-Left Quadrant (Subjective Intention).

The classical phenomenological approach focuses on the world appearing to us through our stream of consciousness as a configuration of meaning. Elements of consciousness, i.e., perceiving, willing, thinking, remembering, anticipating, etc., are our modalities of self-world relationship. They give us access to our world and to that of others by reflecting on the content (i.e., its meaning or the *what*), which we thus encounter, and also by reflecting on the process (i.e., the *how*). What makes an experience conscious is a specific awareness one has of the experience while living through or performing it. Specific refers here to a direct investigation and description of phenomena as consciously experienced, “without theories about their causal explanation and as free as possible from unexamined preconceptions and presuppositions” (Spiegelberg, 1975, p. 810). With this orientation, phenomenology refers not only to a philosophical inquiry, but serves also in an adapted way research purposes and methodological pursuits. Being a specific research methodology, it is striving to portray phenomena from the personal and contextual perspectives of those who experience them. Accordingly, classical phenomenology – as initiated by Edmund Husserl (1859 – 1938) – approaches phenomena by studying conscious experience as experienced from the *subjective* or *first person point of view* along with relevant conditions and horizons of experience, within the larger sphere of the unified field of a person's consciousness and existence; “the psycho-cosm” (Eckartsberg, 1981). Accordingly it basically represents a philosophy that considers anything appearing to consciousness as a legitimate field of inquiry (Stewart & Mickunas, 1990, p. vii).

As a distinct philosophical movement, phenomenology emerged largely from the philosophical views of Husserl, who was struggling against psychologism, historicism and scientism, in so far as they reduce the life of man to a mere result of external conditions acting on him. He was seeking to reaffirm rationality at the level of experience, without sacrificing the vast variety that it includes while laying aside (bracketing) all the processes of conditioning which psychology, sociology, and history reveal. Moreover, Husserl dealt critically with the Cartesian philosophy regarding the rational justification of knowledge. Instead of the Cartesian distinction between the subject and the object of thinking, he maintained that the two must be considered together (Husserl, 1963, 1964, 1989). Thus Husserl, like Heidegger, also early on understood that the phenomenology project could not exclude the objective domain even though the starting point and approach was from the subjective perspective.

Husserlian philosophy considers the unique and virtual experience of things themselves that is to allow experience to speak for itself through conscious subjectivity. With this aspiration, Husserl is part of a movement at the end of the nineteenth century and early 20 century to transcend the limitations of the materialist, empiricist and positivistic approach to science and philosophy.

Husserl`s call to return to the investigation of the things as they appear tried to overcome examining and explaining only their material conditions, extrinsic causes etc. without finding out what they are and mean intrinsically. He extended the Cartesian *cogito, ergo sum* (I think therefore I am) to *cogito, ergo die Welt ist* (I think, therefore the world exists). Accordingly, the objective world is “proved” through subjective identification. Thereby ontology is consequently founded upon epistemology, more precisely on transcendental (inter-)subjectivity that is a reflection of the possibility for knowledge and experience.

Husserl used the concept of experience to mean anything of which we may be conscious or aware of: perceptions of natural phenomena, affective states, desires, moods, but also ideas, mathematical entities, or values etc. All these are phenomena which one can be aware of are phenomena to be investigated. Consequently, phenomenology studies various types of immediate and given experience ranging from perception, bodily awareness, feeling, and volition to thoughts, memory, imagination, and social and linguistic activities.

Importantly, Husserl tried to investigate the formal qualities of the concrete reality which human beings become aware of as their experience. He was searching for an architectonic of thought, which would express and uncover the specificity of the world that is “the genesis and development of phenomena from their most primordial roots in pre-reflective consciousness to their most reflectively sophisticated exemplification in science” (Natanson, 1973, p. 5). Correspondingly, a phenomenologist distinguishes between how phenomena are experienced from how they appear in a subject’s awareness for investigating the structures of consciousness and essences.

Investigating the Structures of Consciousness and Essences

The program of phenomenology aims for disclosing and clarifying the *true* epistemic and ontological significance of consciousness. As mentioned before, phenomenology is specifically dedicated to describing and reconstructing the structures of experience as they present themselves to consciousness. This implies a systematic study of the structures of consciousness that enable consciousness to refer to objects outside itself. Thereby, phenomenology deals with phenomena that are with those *objects* as we experience them in consciousness and with our different ways of *relating* to these *objects* experientially as content of consciousness. Accordingly, phenomenology investigates conscious experience (as experienced) by analyzing the structure, that is the types, intentional forms and meanings, dynamics, and (certain) enabling conditions of various forms of experiences.

The basic structure of forms of conscious experience typically involves what Husserl – following antique and medieval precursors and Brentano – called *intentionality*. This orientation refers to the directedness of experience toward things in the world. It is a special characteristic, of consciousness that it is always one of or about something or someone. According to phenomenology, our experience is directed towards something through particular concepts, thoughts, ideas, images, etc. These modes make up the meaning or content of a given experience, and are distinct from the things they (re-)present or mean. Corresponding to the anti-representationalist stance of phenomenology, consciousness via intentionality reaches out beyond its own acts to the phenomena. However, it can do this only because it constitutes these objects as meaningful. Importantly, constitution for Husserl is not the recognition of a pre-established meaning or value. Rather it is the realized and reflected establishment of a meaning or value in the first place. By the study of consciousness in its world-directedness phenomenology claims to provide insights into not only the structure of subjectivity, but also into the nature of objectivity, thus about the world. In other words objectivity is co-constituted by structures, which are giving meaning-value.

In order to study the structure of consciousness, a phenomenological researcher distinguishes between the act of consciousness and those phenomena at which it is directed. Therefore, classical phenomenology makes a distinction between the perceiving act of consciousness (*noesis)* and the phenomena at which it is directed (*noemata)* that which is perceived. While the noetic refers to the act of consciousness (e.g., believing, willing, hating and loving); the noematic refers to the object (noema), as it appears in the noetic acts, for example as being believed, wanted, hated and loved etc. What we observe is not the object as it is in itself, but how and inasmuch it is given in the intentional acts. Accordingly transcendental phenomenology[2] is the study of the basic components of the meanings that are made possible by intentionality. This implies that something cannot be meaningful unless it is constituted accomplished by (transcendental) subjectivity. For that reason, traditional phenomenology is kind of *a priori science* of subjectivity to study human consciousness in its relation to its objects.

Corresponding to the underlying transcendental orientation, phenomenologically we can know nothing that is non-constituted; in other words there can be nothing, which is not given meaning by acts of a transcendental subject. The implication of this orientation is that phenomenology is not concerned with situating consciousness (as merely yet another object) within an already well-established naturalistic framework and captured by a corresponding objectivism. Rather consciousness is seen in connection with overarching transcendental dimension, which implies also non-psychological reflection. It is important to add that this transcendental subjectivity should not be taken as some kind of other-worldly, ghostly, homunculus. The empirical subject and the transcendental subject are not two different subjects, but rather two different ways of conceiving one and the same subject(ivity). The difference between the two refers to either one being aware of oneself as a causally determined known object, as a part of the empirical world, and on the other hand being aware of oneself as a knowing subject, as the limit of the world.

The underlying goal of phenomenological investigations is to understand essences or essential themes. However, knowledge of essences is only possible by suspending all assumptions about the existence of an external world and the inessential aspects of how the object is concretely given to us. This implies putting into {brackets} the pre-set *framing* that constitutes the ubiquitous background of everyday life. To access essences, what is needed is an unassumptive and non-intervening study of a personally or socially significant phenomena, which are investigated as an experience, rather than as a “conceptualization.” By holding off preconceptions, personal knowledge and habitual beliefs the stage is set, as it were, for a phenomenological description and reflection of the various counters and relations that make up the life-world and its meanings. Consequently, one of the key principles in Husserl's development of phenomenology as a means of philosophical inquiry is the methodological suspensions of all assumptions about the nature of any reality.

---

[2] Transcendental is used here in its Kantian sense to mean an investigation concerned with the modes or ways in which objects are experienced and known, as well as the a priori conditions for the possibility of such experience and knowledge. However, transcendental phenomenology focuses not on what things are, but on the ways in which things are given. For Husserl, this means focusing on phenomena (appearances) and the senses or meanings they have for us and asking how these meaningful phenomena are constituted. Constitution does not mean fabrication or construction; the mind does not fabricate the world. To constitute, in the technical phenomenological sense, means to bring to awareness, to present, or to disclose. That is objects are disclosed or made available to experience in the ways they are thanks to how consciousness is structured. Things show up, as it were, having the features they do, because of how they are disclosed and brought to awareness, given the structure of consciousness. Consequently, transcendental phenomenology attempts to reconstruct the structures, which are underlying and making possible these constitutive achievements.

Methodologies of Phenomenology

Based on the need for suspension, the phenomenological inquiry is specified by methodological procedures and techniques of epoché, bracketing, reduction, and as well as free variation.[3] These methodological concepts, although being often used synonymously, refer to the suspended judgment necessary for phenomenological inquiry. From a Husserlian philosophical stance, only by suspending our judging and a corresponding phenomenological clarification can inquiry proceed, as only this frees from masked assumptions about the nature of the phenomena observed. For Husserl this methodological freeing of the mind from the culturally prevalent habits of thought, and feelings brought with it a strange change in consciousness, which he called a “new universal direction for our interest” (Husserl, 1954, p. 147) which he interestingly compared to a spiritual “Umkehr” (turning or conversion) (Husserl, 1954, p. 140). By consciously investigating the phenomena of life that we habitually take for granted, the world changes before our eyes and reveals the mysterious lining of the all embracing world horizon and the entwining of each thing with universal being. The world then becomes the universal field into which all our experiencing, understanding, and doing are directed. To investigate the relational structure of consciousness and meaning of this plenum of the world as they reveal themselves to reflective consciousness became the task of phenomenology ever since Husserl.

---

[3] Epoché, (literally: astention) is borrowed from the Greek skeptics, refers to the questioning of assumptions in order to fully examine a phenomenon. The *epoché* requires the suspension of commonly held beliefs about one's object of study. By suspending our beliefs, we open ourselves to new experiences; we allow our object of experience to present itself to us in new forms. Bracketing describes the differential setting aside of some portion of an inquiry, so as to look at the whole. It engages in a process in which the *natural attitude* is placed aside such that the researcher may begin with the things themselves, that is in the phenomena as they show themselves in experience. (Phenomenological) Reduction – as a kind of attentive wonder at the world in which we live – phenomenological reduction is simply the consideration of only the basic elements of an inquiry without concern for what is accidental or trivial. It involves ignoring one's prejudices about the world and focusing on the essential aspects of one's object or subject of study. is a specific method of “Rückführung” drawing-back (re-ducere = to lead back) of what appears to how it shows itself, allowing a return to a presuppositionless world. Thus reduction reverses – *re-flects* – man's direction of sight from a straightforward orientation toward objects to an orientation toward consciousness. The aim of the reduction is to re-achieve a direct and primitive contact with the world as we experience it rather than as we conceptualize or construct it. What is left over then is the pure transcendental ego, as opposed to the concrete empirical ego. The reduction to the sphere of immanence, can then be followed by or in concert by heuristic, hermeneutic reduction, methodological and particularly the movement from fact to essence via eidetic reduction. Eidetic reduction requires a shift to consider things not as realities but as instances of idealities, as pure possibilities rather than actualities. With this the various acts of consciousness are made accessible in such a way that their essences--their universal and unchangeable structures--can be grasped. Foregoing everything that is factual and merely occurs in this way or that, this “Wesensschau” is a means of intuitively grasping the essence and essential structures. For Husserl, this second reduction is necessary to fulfill the conditions for genuinely rigorous science. By eidetic reduction Noema can be reduced to their essential (invariant) form or "essence." With this phenomenological interpretation steps back decisively from everyday perspectives and involvements to comprehend their encompassing intelligibility. Transcendental Reduction consists in a reversion to the achievements of that consciousness that Husserl, following Kant, called transcendental consciousness. The most fundamental event occurring in this consciousness is the creation of time awareness through the acts of protention (future) and retention (past), which is something like a self-constitution. To do phenomenology is tantamount to returning to the transcendental ego as the ground for the foundation and constitution (or making) of all meaning (Sinn). Only when a person has reached this ground can he achieve the insight that makes his comportment transparent in its entirety and makes him understand how meaning comes about, how meaning is based upon meaning like strata in a process of sedimentation. Finally there is free variation or imaginary variation of the reduced thing to a common variation or essence (eidos) that is changing - as far as possible - all kinds of aspects (e.g. color, shape, etc.) to see what is essential, what we cannot leave out.. These variations can be put into the service of whatever becomes the focus of the analysis: perception of

Realizing this phenomenological clarification can metaphorically be compared with using a brush, (a) negatively, doing away with the “dust” of entrenched interpretations or theories, etc., and (b) positively, polishing revealing the phenomena in their full brightness. This suspending and bracketing gesture transforms a naive or unexamined experience into a reflexive or second-order one, which is shifting from the natural to the phenomenological attitude. The result of these procedures is that a field of experience appears both less encumbered and more vividly present, as if the habitual distance separating experience and world were dispelled; which then can be further explored in imaginary variation as and communicated.[4] The methodological disengagement from the empirical is practiced in order to highlight consciousness itself and to approach conscious experiences of the world. It is only through the suspension of the natural thesis of the world, that consciousness attains by reflection a level of pureness, which transcends nature and which operates its transcendental constitution of meaning.

As a transcendental philosophy, Husserlian phenomenology is ultimately interested in the possibility conditions and foundations for justified knowledge; not factual, empirical, descriptions of psychological processes. To address this constitutional problem of how meaningful phenomena are brought to awareness or disclosed, transcendental phenomenology tries to uncover the invariant formal principles by which experience necessarily operates in order to be constitutive. As a transcendental project, phenomenology involves a search for a priori structures of consciousness. These structures are the conditions of possibility for any experience,

---

aesthetic forms, the manifestations of empathy, the structure of nowness for improvisation and so on. It is through these multiple variations that a new stage of understanding or intuition arises, an 'Aha!' experience which adds a new evidence and “vision” of connecting structures that carries a force of conviction.

[4] After investigating a particular phenomenon; attending to the mode of appearance involved; and watching the constitution of the phenomenon in consciousness as well as practicing free variation, the intuited need to be expressed and communicated. To stop at reduction followed by imaginary variations would be to condemn this method to private ascertainment. Therefore with a next component the gain in intuitive evidence must be inscribed of translated into communicable items, usually through language or other symbolic inscriptions. The materialities of these descriptions however are a constitutive part of the phenomenological approach and shape our experience as much as the intuition that shapes them. In other words we are not merely talking about an 'encoding' into a public record, but rather again of an 'embodiment' that incarnates and shapes what we experience.

including the experience of the objective world as well as the very idea of objectivity that forms the basis of science. According to Husserl, this transcendental sphere represents the inevitable juncture of object and subject of the thinking self and the object of one's thoughts – in any inquiry.

Even more in the systematic work of phenomenology the old traditional ambiguous antitheses of the philosophical standpoint like oppositions such as between rationalism (Platonism) and empiricism, relativism and absolutism, subjectivism and objectivism, ontologism and transcendentalism, psychologism and anti-psychologism, positivism and metaphysics, or the teleological versus the causal interpretation of the world can be resolved (Husserl, 1927).

For Husserl the objective truths of science must be recognized as grounded in the living acts of human consciousness in relation to worldly phenomena. Accordingly, man and the world are first and foremost in relation. Thus phenomenology is fundamentally about relationships and not about the subjective end of an encounter between a subject and an object. It is only at the subsequent, reflective level of logic that we divide them into separate entities.

With this orientation, phenomenology was conceived by Husserl as a foundational and far-reaching enterprise to secure the basics and methodologies of a rigorous ‘scientific’ investigation of the essential nature of consciousness and its generation of meaning in order to turn back to the world of living.

Return to Life-World

Where science claims to establish facts based on empirical observation, phenomenology seeks to describe the structures of the *“life world” (Lebenswelt)*, the world as it is lived and experienced by conscious subjects. The life-world is the world as it is lived by the person in her everyday life that is not a separate and independent entity. It is the realm where we share knowledge which is useful in its own way for “daily practices” (Husserliana = Hua. VI, 126), as well as “daily practical circumstantial truths” (Hua., VI, p. 135).

This life-world is also the unexamined foundation and matrix of scientific activity; and phenomenology makes these common-sense phenomena its object of investigation. “From a phenomenological viewpoint, the life-world is pre-theoretical and pre-scientific. . . . It is the foundation of all sciences” (Giorgi, 1997, p. 248). If science forgets the life-world as their foundation of meaning and base it “hang in the air groundlessly” (Hua., VI, pp. 48, 144). Furthermore, by presenting scientific images of the world as representing “reality,” modern science conceals the life-world that is the origin of scientific re-presentations. Therefore a return to the life-world is proposed by Husserl, particularly in his later important writing on the “Crisis of European Sciences” (1970). Emphasizing the challenges presented by increasingly one-sidedly empirical and naturalistic orientation in modern science, Husserl is showing the need for linking the basic notions of science back to their conceptual roots in the pre-scientific regions of the life-world which is the background, horizon (framework of interpretation), and foundation of cognitive activities.

To elucidate and systematically understand the dynamics of experience related to the principle of correlation in the life-world is the task of phenomenology. This focus on life-worldly phenomena, which is also closely related to intersubjective and socio-cultural processes[5], have become programmatic in the development of a more hermeneutically and existentially oriented phenomenology. It is a program, which aims at describing how phenomena present themselves in lived experience in human existence of what Heidegger (1962) calls “being in the world” (In-der-Welt-Sein). As the life-world is a social, political, historical, and cultural environment where human beings interpret, communicate, and socially engage in multiple communal spheres this opened up a series of questions and issues dealt with in further developments of phenomenology.

Critique and Further Developments of Phenomenology

The following gives an introductory overview of basic limitations and criticisms of classical phenomenology and the development of various phenomenological movements. Husserl´s original inspiration of phenomenology has undergone significant development and change through the work of his successors. According to Ricoeur (1953, p. 836), phenomenology is the story of the deviations from Husserl; its history, as it were, is the history of Husserlian heresies. Various criticisms have been raised concerning the partly supposed implicit Cartesianism, transcendental idealism, essentialism, monism and supposed solipsism as retained problematic metaphysical assumptions in Husserl´s substance philosophy. Accordingly, Husserl´s work has been interpreted as a radicalized neo-Cartesian philosophy[6] and essentialistic neo-Idealism following basic form of intentionality in the experience: subject-act-content-object, and trying to discover ideal form of phenomena (eideia) and stressing a priori conditions of knowledge. However, the image of classical phenomenology as being one-sidedly conceived as an investigation of a detached transcendental ego from whom its own body, worldly things, and other subjects were but constituted objects appears as a pejorative caricature, underestimating Husserl's endeavor (Zahavi, 2008, p. 662).

---

[5] In his later works Husserl showed that below the personal activity of the individual and transcendental ego there is a prior meaning-giving function, that of transcendental intersubjectivity. This one offers to each individual a set of prefabricated meanings handed down from history through the medium of language. We come to consciousness within a life-world, which has already been given meaning by a cultural originator of meaning, transcendental intersubjectivity. According to Husserl, intersubjective experience plays a fundamental role in our constitution of both ourselves as objectively existing subjects, other experiencing subjects, and the objective spatio-temporal world. Just as intentionality constitutes a self-identical object within the constantly changing flux of experience, so contingent intersubjective constitution can establish objects accessible to anyone able and willing to take on the scientific project.

[6] Although unlike Cartesian subjectivism, Husserl's phenomenology is not based expressly on the pure interiority of the self-conscious ego but on the consciousness of the world taken strictly as one's – the transcendental ego's phenomena. On the Cartesian model, the reality and truth of objective being, including that of other selves, lie originally outside the essential structure of consciousness understood as "representation" (i.e., as the subject's positing and securing of cogitations in self-certainty), and so against the presumed errors and uncertainties of everyday experience, philosophy must attempt to "recreate" this reality and truth on an absolute philosophical foundation. With the phenomenology of consciousness, in contrast, the reality and truth of objective being are in principle implicated originally in the essential structure of consciousness as intentionaland so have only to be explicated more originally. By means of such explication, then, the human beings that exist for one in everyday lived experience are not, as it were, made to disappear, as they are in Cartesian doubt. Rather they are transformed into alter egos having the ontic meaning of implicata. Moreover, as such implicata these alter egos are not simply a particular, possible achievement of intentional life but an intrinsic, essential dimension of it. Within the vitally flowing intentionality in which the life of an ego-subject consists, every other ego is intentionally implied in advance, implied not as real particular persons in the flesh, but as others in general, that is, as a transcendental intersubjectivity that precedes and makes possible all relations to actual others within a monadic community. It is the exploration of this transcendence which in principle distinguishes all radical phenomenology from Cartesianism.

Nevertheless, post-Husserlian phenomenology, including that developed by Husserl himself, is marked by attempts and self-critical moves towards over-coming classical phenomenology that is focusing primarily on the study of structures of subjective experience or consciousness in relation to phenomena as very base of research. Husserl's "identification of phenomenology with subjectivism [was] an unfortunate and unnecessary narrowing of its original objective, violating the ideal of freedom from the unexamined presuppositions" (Spiegelberg, 1975, p. xxiii).

Consequently, succeeding phenomenologists developed a resistance to Husserl´s turn to transcendental idealism and problematized the methodological limitations of classical phenomenology. For such philosophers, phenomenology should not bracket questions of being or ontology, as the method of epoché would suggest. They have loosened Husserl's strict requirements by recognizing that it is impossible to interpret social action without relying upon prior knowledge and experience.

> "In place of the Husserlian procedure which moves from the world of the natural attitude up to a higher, transcendental plane with a view to bring to light the transcendental structures constitutive of the objectivity of the entities encountered in the natural attitude, (starting with Heidegger) we find an alternative procedure which moves from the ontic level down to a deeper, ontological plane with a view to bringing to light the ontological structures constitutive of the being of the entities in question." (Macann, 1993, p. 63)

The basic pattern shift can be described as moving from value-free phenomenological reflective analysis operating under the self-imposed methodological disciplines to passionate value-engagement and existential commitment. This shift marks a move from the primacy of knowing to the primacy of enacted life praxis.

Both the subjects' descriptions and the researchers own characterizations of general meanings are socio-culturally embedded in articulated language. That is to say, they are already encrusted with the presuppositions and preconceptions of a culture. Being is always already embedded and related to a horizon of meaning, and therefore all approaches and findings are bound by historical and cultural perspectives. Researchers therefore cannot actually and totally bracket all they know or believe that they know about their phenomena of interest; hence the phenomenological reduction cannot be fully attained. According to Merleau-Ponty (1962, p. xv) "the most important lesson which the reduction teaches us is the impossibility of the complete reduction". A modified phenomenological suspension method is not, as in Husserl, to bracket off the world in order to discover the pure, worldless that is a-contextual structures of consciousness. It is rather, to use the distance supplied by the reduction as a heuristic device to reveal and interpret the genuine phenomena and the implicit pre-reflective background.

Husserl's original concept has taken flesh, in a variety of ways, some of which are hardly compatible with each other. With Heidegger (1962), phenomenology resolved into what he called "fundamental ontology" purging residue of Aristotelian and Kantian mentalism in Husserl´s approach. Philosophising on "In-der-Welt-Sein (being-in-the-world), Befindlichkeit (attunement in mood) and Da-Sein (t/here-being) and the corresponding development towards a hermeneutical phenomenology endeavors to disclosure of unconcealed temporal and historical "Being." This attempt to overcome conventional metaphysical orientations of philosophical tradition and raising the question of the meaning of Being as well as reintegrating ontological dimensions and Heidegger's analysis of became influential for many subsequent philosophical views and approaches (Dreyfus, 1991).[7]

Related to this ontological phenomenological orientation further streams of phenomenologies emerged. Among others there are "existential" (e.g., Sartre, de Beauvoir, Marcel), "hermeneutical" (e.g., Gadamer, Ricoeur), "ethical" (e.g., Scheler, Levinas), and "experiential" or "practice-oriented" orientations (e.g., clinical psychology, medicine, education or pedagogy, nursing, counseling etc. An important application is also what has been named "eco-phenomenology" (e.g., Brown & Toadvine, 2003). This kind of phenomenology tries to develop a middle ground between phenomenology and naturalism, opening up an access to the Nature and the natural that is both independent of the conceptuality of the natural sciences, and of traditional metaphysics.

Schütz's social mundaned phenomenology of acting and the social world having various provinces of meaning (Schütz, 1972; Schütz & Luckmann, 1989) became important for application of phenomenology to social sciences, sociology, social psychology, but also economics and organization studies as well as and methodologies like ethnomethodology and conversation analysis. Furthermore, phenomenology has been a source or given rise to various related philosophical movements such as "linguistical" and "post-structuralist" postmodern, philosophy (e.g., Barthes, Blanchot, Deleuze, Derrida, Foucault, Kristeva Lyotard), but also feminism, (e.g., Langellier, 1994) or culture critique (e.g., Fay, 2003). More recently, there are new bridges been built between phenomenology and "techno-science" (Ihde, 1979, 1986) and cognitive science (Baumgartner et al., 1996; Gallagher, 1997, 2003, 2005, 2007) and neuroscience i.e. “neuro-phenomenology” (Varela, 1996; Varela et al., 1991) as well as a naturalized phenomenology (Petitot et al., 1999; Petitot, 2000; Zahavi, 2004). The latter one is pursuing the integration of the disciplines, thus relating phenomenology and its refined accounts of consciousness with contemporary cognitive and natural science.

---

[7] Heidegger became one of the most influential philosopher of the 20th century in continental philosophy, but has been exposed to radical criticism, including his priority of ontology, his neglect of ethics and the body and embodiment as well as sexual difference. For the later Heidegger the essence of being human is the maintenance of an authentic openness to Being. Relevant for economics and organization studies, interestingly the later Heidegger problematized the technological-scientific-industrial modes and what he calls "calculative thinking," – in contrast to a meditative one – restless thinking directed toward manipulation, toward obtaining some specific result. Meditative thinking, however, requires patience and silence, being as well as doing. It requires that we somehow stop and recollect ourselves. It requires conditions in which we can practice innocent looking and listening, the kind of awareness that we experience when we truly, unselfishly love someone or something – when we love the truth. For real thinking depends on openness, openness to whatever is in front of us. And it must start with what is closest – our own being. It is only then, when we are truly open to ourselves, that what is true can enter our perception and reveal itself fully to us. It is only then that we can go beyond the "stimulus-response" mode of living, a mode of living that is suited to machines not people. It would be important to investigate critically Wilber's interpretation of Heidegger's ontology and hermeneutics, which is insufficiently classified as subjectivist form of hermeneutics (Wilber, 2006, p. 188).

In a second part of this article, I will outline in detail the important advancement of phenomenology by the philosophy of Merleau-Ponty, who is emphasizing the neglected role of the living body and embodiment in human experience. I will try to show how his reformed phenomenology provides a base for a proto-integral interpretation. But before that, there is the need to critically reflect on the status of phenomenology in integral theory.

Status of Phenomenology in Integral AQAL Theory

In the following I will discusses the status and usage of phenomenology in integral theorizing. This is not pursued in a spirit of fault-finding or narrow-minded judgmentalism, but scholarly, reasoned scientific critique for showing deficiencies and potentials of some ideas of the integral model as it has been developed by Ken Wilber. As a contribution for a discourse that aims at a critical appreciation, but also appraisal and evaluation of some propositions, assumptions and interpretations of integral theory. This kind of critical inquiry is motivated also by a quest for a true, good and perhaps more beautiful integration of phenomenology into the emerging body of integral theorizing. Hence it tries to contribute for the further development and refinement of the integral vision, by adding a voice to the integral adventure (Wilber, 2006, p. 170).

Generally, Wilber recognizes phenomenology as an useful, if limited, aspect of a more integral methodology, respectively a methodological pluralism (Wilber, 2000d, p. 153; 2000b, note 21 for chap. 14). However, the problematic status, which phenomenology gets in integral research is based on, what seems to me a highly selective reading and interpretation of “phenomenology” by Wilber. If a critical reader studies the definitions and understanding of Wilber’s interpretation of phenomenology, (e.g. 2000a, Vol. 6, note 28 for chap. 4, p. 583, Wilber 2000c not 21 for chap. 14 Wilber, 2000d, 152, and note 7; 2006 chapter 3, p. 64) it appears as only those aspects are brought into the front which fit into the constructed framework.

This does not do justice to phenomenology and to a truly integrated orientation. Focusing mainly on the classical phenomenology, variations are mentioned, though decisive further developments are ignored or underestimated. Although Wilber recognizes that the phenomenology of the I-space is a “rich and complex topic” the mentioned “short-cuts” and phaneroscopic ways taken (Wilber, 2003, Excerpt C, Endnote 28) in his quick introductory overview, are in danger of turning into aberrations. Furthermore the “liberties of simplification” (Wilber, 2003, Excerpt C, Endnote 29) may lead to distorting interpretations and complications, as only selective and fitting parts are chosen. Emphasizing merely partial or narrowed aspects could be misleading uniformed readers into an inadequate representation of phenomenology. In Wilber`s interpretation phenomenology is merely a “philosophy of the subject and subjective” (Wilber, 2006, p. 92).

It is true that (classical) phenomenology studies conscious experience as experienced from the (transcendental) subjective or first person point of view. But this positioning and the interpretations given all need to be qualified and specifically discussed and contextualized. In the following I will do this by raising some important issues. In particular;

- the "ordering" of phenomenology into one quadrant (upper left) or zone (#1),
- the status of consciousness, and the states/structures debate,
- inter-subjective dimensions in phenomenology, and
- the relation to contemplation and meditation.

The "Ordering" of Phenomenology into Upper Left Quadrant and Zone #1

For Wilber phenomenology stands as a "representative methodology" for the study of the occasions that arise in an I-Space" (Wilber, 2003, Excerpt C, II, 43ff). As a "general disposition" he puts phenomenology in line with human interest in consciousness like "introspection, meditation, contemplation, or simply feeling" (Wilber, 2003, Excerpt C, II, 43ff). For Wilber the phenomenological space is "an indigenous perspective that is embodied, embedded, enacted and enfolded in other spaces," (Wilber, 2003, Excerpt C, II, 46): a nexus of inter-holonic occasions.

Like the classification of phenomenology into the upper left quadrant, Wilber assigns phenomenology – in his further developed approach (Wilber, V) – as a representative methodology for the Hori-Zone #1 (Wilber, 2003, Excerpt C, II, 48), that is an interior reality seen from within its own boundaries. Again, he equates for the singular form of the inside of an "I" phenomenology, introspection and meditation all together as classic paradigms or injunctions that bring forth, enact and disclose first-person singular dimensions of being-in-the-world (Wilber 2003, Excerpt D, 12). Wilber interprets indiscriminately all of those many forms of phenomenology as "variations on zone-#1 approaches, some of which investigate particular types of interior experiences known as phenomenal states" (Wilber, 2006, p. 93). However, this supposedly clear assumed positioning is neither valid for "classical phenomenology" and even less true for advanced phenomenology and interrelational pheno-practice as outlined in the second and third parts of this paper.

Methodologically, Wilber equates bracketing with the "non-exclusion principle applied to interior domains" (Wilber, 2003, Excerpt C, II, 45). Focusing on phenomenological methods of bracketing cannot only be applied or limited to interior domains. Such usage does not cover the full-range of phenomenological methodologies and their fields of empirical application. Furthermore, it is possible to use phenomenological methods as lenses to make distinctions and to ask different kinds of questions, develop research designs and pursuit empirical research related to phenomena in various quadrants or zones as they are holonically interrelated fields.

The emphasis that phenomenology lays on the importance of the first-person perspective should not be confused with the classical idealistic attempt to detach the mind from the world in order to let a worldless subject or pure consciousness constitute the richness and concreteness of the world. Phenomenologically, the truth is not be found in the interiority of human beings since for Heidegger (1962) as "Dasein"[8] (literally meaning being-there/here) it is *in* the world and any knowing of phenomena can only be gained by means of inhabiting and being intentionally, actionally or otherwise related to and engaged in a world. Thus, the "subjectivity" disclosed by the phenomenological reflection is not a concealed interiority, but an open world relation; and phenomenology is interested in consciousness because it is world-disclosing (Zahavi, 2008, pp. 664-665, 675).

---

[8] Importantly for Heidegger (1962) Dasein must not be mistaken for a subject, that is something definable in terms of consciousness or a self. Being situated as Dasein is part of the being-structure of being human

Status of Consciousness and the States/Structures Debate

One important contentious issue of the role of phenomenology for integral research concerns the status, and in particular the states and stages of consciousness. Although states involve both consciousness and behavior, Wilber usually refers to states as subjective phenomenological patterns of consciousness (Wilber, 2000d). These subjective states may be comprised of feelings, thoughts, intentions and other experiential events, including subconscious or pre-conscious contents as well as occur as so called altered states of consciousness.[9] Furthermore corresponding to normal states there are transpersonal states of consciousness (psychic, subtle, causal, and non-dual), which in turn again are supported by a corresponding body (Wilber, 2000d, p. 151).

In order for temporary states to become permanent traits or structures, they must enter the stream of development. Thus, "any given broad state of consciousness (such as waking or dreaming) can contain several different structures (or levels) of consciousness" (Wilber, 2000d, p. 151). Within broad states of consciousness there are structures of consciousness, within which there are phenomenal states (joy, happiness, sadness, desire, etc.) (Wilber 2000c).

According to Wilber "phenomenology usually focuses on phenomenal states and thus fails to spot the existence structures of consciousness" (Wilber, 2000d, p. 152). As the structures of consciousness are not directly perceived by the subject they[10]

---

and as such permeates every aspect of our pragmatic activities and our social relations. Thus, the fundamental mode of Being is not that of a subject or of the objective but of the coherence of Being-in-the-world.

[9] Edward notes:

> Because they are often characterized as rather atypical occurrences, it might be added that altered states of consciousness (ASC) are usually defined as conditions where the self-system is temporarily transported into a non-normative condition. In this sense, states are often discussed as ASC in that they are different to the normative waking state of identification of the self-system. In terms of the AQAL framework, an ASC is one where the self-system temporarily identifies with a different level of consciousness, (and, in quadratic terms, with a different level of behavior, meaning/values system and social identity). An ASC can be naturally induced, self-induced or result from environmental factors. They can be consciously aimed for or accidentally stumbled on. They can result from behaviors, cognitions and images, social and interpersonal situations and cultural practices. They can be healthy for the development of the self-system and they can be harmful and inhibit growth. It all depends. (Edwards An Alternative View on States, in http://www.integralworld.net/edwards14.html)

Here Edwards criticizes that the integral theory model of states is committing the category error of falling into the Pre-trans Fallacy, when it proposes that individuals access transpersonal states and/or realms when they enter into the natural states of dream sleep and deep sleep.

[10] For Wilber consciousness (cont'd next page)

> are almost never spotted by phenomenology, which inspects the present ongoing stream of consciousness and thus only finds phenomenal states. This appears to be a significant limitation of phenomenology. That is, phenomenology usually focuses on phenomenal states and thus fails to spot the existence structures of consciousness…. (Wilber, 2000d, 152, see also Footnote 7)

Wilber regards the phenomenon of states – in contrast to stages (Wilber, 2006, Chapters 2 and 3) – as one factor among many others that can be used to understand the nature of individual experience: Having a conscious awareness and mindfulness, everybody experiences various states of consciousness, and these states often provide profound motivation, meaning, and drives, in both yourself and others. In any particular situation, states of consciousness may not be a very important factor, or they may be the determining factor, but no integral approach can afford to ignore them (Wilber, 2005, p. 15). State-based explanations of subjective experience are closely allied, therefore, to stage-based models of development. Where stages account for the structures of consciousness, states provide the content. Accordingly, integral theory's system of phenomenal states provides a framework for interpreting, understanding and explaining phenomena associated with the dynamic and fluid nature of subjective aspects of the human life-world.

However, it is not correct to allege that structures of consciousness are not "spotted" by phenomenology. Phenomenology does not only inspect phenomenal states, but investigates *essences* as invariant structures also of consciousness. Based on a deliberate anti-psychologism it is an intrinsic characteristic of phenomenological analysis that inquiry strives to be eidetic, that is, to distinguish the essential from the accidental or incidental (states). It is not just any constituent, implicit dimension or relation among aspects, or pervasive orientation that phenomenological analysis seeks to discern, but those which constitute the essential structural being of experience. Thus, phenomenology seeks to describe the experiential structures in their phenomenal purity and does not psychologise them, that is, it does not objectify and naturalize them. Thus descriptive analysis of states is part of a more comprehensive project of phenomenological investigations, which also aims at examining structures of consciousness.

In addition to descriptive phenomenology, in which phenomena and states of consciousness are explored, scrutinized and described so as to enrich the awareness of the richness of experience, essential or eidetic phenomenology involves a more profound exploration of phenomena and consciousness, with the goal of uncovering the essential relationships, and meanings embedded within them. For phenomenology, particularly intentionality, describes a basic structures of consciousness. With this focus one of the most radical stances of phenomenology is its recognition of the relational structure and characteristic of consciousness.

> …is not a thing or a content or a phenomenon. It has no description. It is not worldviews, it is not values, it is not morals, not cognition, not value-MEMEs, mathematico-logico structures, adaptive intelligences, or multiple intelligences. In particular, consciousness is not itself a line among other lines, but the space in which lines arise. Consciousness is the emptiness, the openness, the clearing in which phenomena arise, and if those phenomena develop in stages, they constitute a developmental line (cognitive, moral, self, values, needs, memes, etc.). The more phenomena in that line that can arise in consciousness, the higher the level in that line. Again, consciousness itself is not a phenomenon, but the space in which phenomena arise. (Wilber, 2006, p. 87)

Phenomenological inquiry posits that – as mentioned before – fundamentally consciousness is always structured and directed relationally, that is it is always consciousness “of” something or someone.

As phenomenal structures of experience are richly intentional, these involve not only sensory ideas and qualities of states, but complex representations of time, space, world, body, and the organized structures of lived reality in all its conceptual and non-conceptual forms. Thus conscious mental acts are not only about concrete appearances of material things such as trees, houses or computer hardware, but also past or future ideas like a conscious memory of the attack on the World Trade Center or a conscious anticipatory desire for a glass of clean and cold water. Thus the relational structure of consciousness to things encompasses also immaterial phenomena such as emotions, dreams, concepts or even seemingly irreal imaginations. By and through this recognition of relationality, the equal right of things towards which consciousness is directed is asserted. In other words, phenomenology has its starting point by assuming that consciousness cannot function independently of structural relations to “things” to be conscious of, which are interrelated to inter-subjective and objective spheres

Conscious experience presents us not with isolated properties or features but with objects and events situated in an ongoing world-contact, and it does so by embodying in its experiential organization and dynamics the dense network of relations and interconnections that collectively constitute the meaningful structures of a world of objects.

Phenomenologically, consciousness is a kind of medium through which various phenomena and dimensions appear and unfold.[11] Actually, this understanding is close to Wilber’s interpretation of consciousness: “Consciousness is not a phenomena but *the space in which phenomena appear*, and therefore “levels of consciousness” simply means levels of the phenomena appearing” (Wilber, 2003, Excerpt D 94, Wilber, 1997).[12] If consciousness is a such

---

[11] Part of the nature or structure of conscious experience is the way it is being experienced, that is the way they are lived through or performed. The essential structures or forms of consciousness maintain a specific tension in relation to its contents: For example the forms of temporalizing consciousness, i.e., the living present with its primordial impression, retention, and protention, are essential structures of consciousness that remain ever constant. Meanwhile, however, the contents of conscious experience (which, in a way, are the conditions of possibility for these structures’ existence), are by definition continually passing away. Consciousness itself, therefore, is necessarily a stable force and a flowing away, a standing and streaming.

[12] Wilber states:

> Rather, it appears that consciousness actually exists distributed across all four quadrants with all of their various levels and dimensions. There is no one quadrant (and certainly no one level) to which we can point and say: There is consciousness. Consciousness is in no way localized in that fashion….Rather, consciousness is a four-quadrant affair, and it exists, if it exists at all, distributed across all four quadrants, anchored equally in each. Neither consciousness, personality, individual agency, nor psychopathology can be located simply or solely in the individual organism. The subjective domain (Upper Left) is always already embedded in intersubjective (Lower Left), objective (Upper Right), and interobjective (Lower Right) realities, all of which are partly constitutive of subjective agency and its pathologies. It is true that the Upper Left quadrant is the locus of consciousness as it appears in an individual, but that's the point: as it appears in an individual. Yet consciousness on the whole is anchored in, and distributed across, all of the

an "opening or clearing[13] in which things and events arise" (Wilber, 2003, Excerpt D 95) and if basic levels of consciousness are what all concrete streams have (or can have) in common (Wilber, 2003, Excerpt D 94), then this has far-reaching implications and consequences. Of course, like other scientific disciplines or analytic philosophy, phenomenology offers not one, but many accounts of consciousness (Kriegel, 2007; Thompson 2007; Thompson & Zahavi, 2007; Woodruff Smith & Thomasson, 2005).

Understanding that the irreducible consciousness is embedded and distributed across all quadrants with all of their various levels and dimensions, then the upper left quadrant cannot simply be the functional locus of a consciousness (quadrant), which then methodologically can be approached by phenomenology (Wilber, 1997). A genuinely integral theory of consciousness requires to be a radical decentred and processual approach. Only such a dynamic understanding allows us to realize that consciousness is not an interior anything, nor an exterior anything, but that it permeates both and that is the space or better medium from and through interior and exterior subjective and objective dimensions arise and process.

Consciousness is always what is seen and felt (psychic-intentional) and embodied and enacted (behavioral) within a socio-cultural (the other) and systemic nexus. If we see that the phenomenological space or medium of consciousness is inherently related to the entire AQAL-space, then we need considering further advanced phenomenological approaches to consciousness and mind (e.g., Gallagher, 2007; Gallagher & Zahavi, 2005, 2008) and with this, more inter-subjective and inter-relational perspectives (see part I, II).

Inter-subjective Dimensions

Wilber alleges a general inadequacy of phenomenology for spotting intersubjective structure-stages. He states that phenomenological method cannot easily spot subjective structures (i.e., psychological structures in the Upper-Left quadrant, such as those discovered by Graves; Piaget; Loevinger; etc., *nor spot inter-subjective structures and inter-subjective stages* (in the Lower-Left quadrant, e.g., Gebser's worldviews, Habermas's stages of communicative competence, interpersonal moral stages, Foucault's interpretative-analytic side of the structures of power, etc.). As suggested in the main text, no amount of introspection by individuals will disclose social structures of oppressive power (e.g. Foucault), moral stages (e.g., Gilligan), linguistic structures (e.g., Chomsky), stages of ego development (e.g., Loevinger), stages of values (e.g.,

---

> quadrants – intentional, behavioral, cultural, and social. If you `erase' any quadrant, they all disappear, because each is intrinsically necessary for the existence of the others. (Wilber, 1997, pp. 71-92)

[13] Knowing about the problematic use of the metaphor of "space" which tends to be interpreted wrongly as container Wilber rightly uses – like the later Heidegger in a different way – the image of an opening or clearing:

> Consciousness is not itself a stream, line, module, function, or intelligence—it is not any thing or event or process of any sort. Consciousness is rather the opening or clearing in which things and events arise. A ´level of consciousness´ is simply a measure of the types of things and events that can arise in the first place; a measure of the spaciousness in which a world can appear; a degree of openness to the possibilities of the Kosmos; a sweep of the horizons within which phenomena can manifest; a measure of the awareness inhabiting each perspective, moment to moment to moment.(Wilber, 2003 Excerpt D 95)

Clare Graves), and so on – all of those are inherently invisible to mere phenomenology (Wilber, 2000d, 153, see also Footnote 7).

For Wilber "…phenomenological approaches tend to be strong in the "I" components but weak in the "we" components" (Wilber, 2000d, 153, Footnote 7). For him also the cultural phenomenologists (e.g. ethnomethodologists), although being relatively strong in the "we" or intersubjective components, do not cover sufficiently stages or structures of intersubjectivity, or when presented "phenomenology shades into neo-structuralism" (op.). According to Wilber phenomenological methods miss virtually all of the intersubjective structures and intersubjective stages (Wilber, 2000d, 153, Footnote 7; see also Wilber 1995, p. 771). Thus, for Wilber phenomenology has an "incapacity to comprehend *inter-subjective structures* not given in the immediacy of felt body meanings, and thus its incapacity to deal effectively with the *development* of consciousness and the social world" (Wilber, 2000c, p. 286, endnote 21. emphasis in the original). In Wilber's interpretation "phenomenology failed to take into account the *cultural embeddedness* and the intersubjectivity of all awareness" (Wilber, 2006, p. 64). For Wilber phenomenology is merely a "philosophy of the subject and subjective" (Wilber, 2006, p. 92), which needs to be supplemented – not replaced – with the philosophy of intersubjectivity.

However, in contrast to this critique and positioning, intersubjectivity is one of the main themes already of transcendental phenomenology (see Husserl 5th of the Cartesian Meditations and Hua XIII-XV of Husserliana). According to Husserl, intersubjective experience plays a fundamental role in our constitution of both ourselves as objectively existing subjects, other experiencing subjects, and the objective spatio-temporal world. According to Husserl, the "I" becomes conscious and particularly aware of "myself" specifically as a human person only in intersubjective relations (Husserl, 1973b, p. 175; 1952, p. 204). Furthermore developing as a person depends heavily upon social interaction (Husserl, 1973b, pp. 170-171).[14]

I and we and world belong together and are intertwined, partly as they reciprocally illuminate one another, and can only be understood in their interconnection (Zahavi, 2008, p. 681). Thus phenomenology considers the very constitutive nature of the Lower-Left quadrant and even exterior quadrants. Husserl already suggested a theory of intersubjectivity or social cognition that was based on an embodied, inter-modal perception. For him the perceptual experience of the other person involved a kinaesthetic reverberation of the perceived action of the other in our own sensory-motor system. According to Gallagher,

> Phenomenology tells us that our primary and usual way of being in the world is pragmatic interaction (characterized by action, involvement, and interaction based on environmental and contextual factors), rather than mentalistic or conceptual contemplation characterized as explanation or prediction based on mental contents. (Gallagher, 2005, p. 212)

The integration of inter-subjectivity shows that the social world has been systematically and methodologically considered in the development of the phenomenology project. Accordingly the philosophy of the subject and subjectivity is always already supplemented with the philosophy of intersubjectivity. Related to the AQAL-framework, the upper left needs its lower left, not to mention its upper right and lower right spheres (Wilber, 2006, p. 64). A more adequate understanding of phenomenology recognizes that the subjective space itself develops via inter-subjective patterns of dialogue and interpretive cognition (Wilber, 1995, pp. 28, 576ff, 583).

---

[14] My experience of the world as objective is mediated by my experience of and interaction with other world- engaged subjects. Only insofar as I experience that others experience the same objects as myself do I really experience these objects as objective and real. To put this point in phenomenological language, the objectivity of the world is intersubjectively constituted (i.e., brought to awareness or dis-closed).

Accordingly, further developments of phenomenology and as we will see, particularly Merleau-Pontyian interpretations have deeply investigated the complex patterns and structures of inter-subjectivity and inter-relations between subjects as well as (inter-)objective dimensions and conditions, as outlined in the second and third parts of this paper.

Phenomenology in Relation to Introspection and Meditation

Wilber equates for the singular form of the inside of an I likewise phenomenology, introspection and meditation as classic paradigms or injunctions that bring forth, enact and disclose first-person singular dimensions of being-in-the-world (Wilber, 2003, Excerpt D, 12). Putting phenomenology on a level with (non-methodical) introspection and meditation is to equalize approaches, which are different, incomparable and hence incommensurable. There is a tremendous difference between phenomenology, as a specific philosophical school and a “general movement” or “general disposition,” being “as old as the human interest in consciousness itself, whether we call it introspection, meditation, contemplation, or simply feeling” (Wilber, 2003, Excerpt C, 43).

Taking a step back, in order to better jump forwards in ways that otherwise would have been difficult to do, there is certainly a kind of parallel or common orientation between contemplative and phenomenological scientific research. By redirecting our attention to what is most directly given in experience, as (conscious) experience, phenomenology can help us overcome all kinds of mistaken identification. Phenomenology follows a kind of contemplative and in some ways even meditative attunement to the phenomenon in question. This is due to the orientation that it refers to more receptive and aesthetic forms of thinking and focusing attention, holding back from closure and from discriminatory analytic thinking in favor of a more contemplative-like process. In this form of thinking the mind does not “seize upon” the object to analyze and subdue it but attempts to behold it, to allow its reality, its beauty and its texture to become more and more present. But the stance and quest phenomenology was developed for and has been used by researchers, particularly social scientists, serves as a systematic, rigorous search for truth. Accordingly, the outcomes of phenomenological reflection are not just “insights” or epiphanies but thoughts, discourses and written texts, that is forms of interpretation of a processed and elevated experience.

Furthermore, phenomenology and introspection “enact, bring forth, and illumine the first-person singular dimensions of being-in-the-world” (Wilber, 2003, Excerpt C, 43) very differently than a spiritual revelation. Husserl called one of his originally speeches – which became later an important book – Cartesian Meditation (Husserl, 1960). However, this is not a meditation in the sense of a spiritual practice. Rather Husserl saw it as a scientific contribution and introduced in it a genetic phenomenology, which he defined as the study of how these meanings are built up in the course of experience. In particular, the sixth Cartesian Meditation deals with the question of how a phenomenologist can explicate a subjectivity that both belongs in the world and yet constitutes objectivity and its world and deals with transcendental inter-subjectivity, to overcome the solipsistic objection.

Already, classical phenomenology argued for a proper understanding of transcendence, for not falling into solipsism:

> Is phenomenological research therefore solipsistic research? Does it restrict the research to the individual ego and precisely to the province of its individual psychic phenomena? Not in the least. [A] misunderstanding of the particular meaning of transcendence and its exclusion leads to a confusion of psychological immanence (that which is precisely solipsistic) and phenomenological [immanence]. (Husserl, 1910-11, p. 154)

It is important to understand that phenomenological reduction is not an introspection, it is not "seeing inside," but a tolerance concerning the suspension of conclusions that allows a new aspect or insight into the phenomenon to unfold (Varela, 1996, p. 339). "Phenomenology is not another name for a kind of psychological self-observation, nor is it simply to be identified with a first-person description of what the "what is it like" of experience is really like" (Zahavi, 2008, p. 678).

Therefore the methods of phenomenology do not rely on introspective peering internally at one's passing stream of consciousness, but – as shown before – redirecting the focus away from the entire empirical natural world, including real psychological and introspective experiences, and to refocus the study of the mind on essences of conscious experience of various kinds.

At the heart of the phenomenological method is the assumption that human experience follows fundamental structural principles that express themselves differently and contingently. Experience is necessarily personal, but not necessarily private. Therefore, phenomenology is not a reiteration of introspective solipsism, for it assumes that the study of particular experience leads to the recognition of generative structures that are common to human beings more generally.

For this reason, the interpretation and radical designation of phenomenology as (solipsistic) introspectivism and equating it with contemplative literature is, if at all, only partially justified. [15] Moreover, the supposed link to introspective orientation of phenomenology does not consider further and advanced phenomenological developments, which disclose and take inter-subjective and inter-objective patterns, structures and processes into systematic account.

---

[15] In Husserl's private letters one can find statements showing his struggle with a religious and spiritual quest. "The life is at all hard and I long much for that peace, which must form the natural conclusion of this terrestrial existence. However, I feel not yet enough religiously prepared and the end of my philosophical life longs for the last religion-philosophical completion" (Husserl, Brief IX, 93, 1917). Interestingly Husserl lived in the "solid faith of the divine meaning of the world and mankind." (Husserl Brief III, 494). In a telling proclamation he stated: "Finally for me philosophy is my a-religious way to religion, as it were my atheistic way to God." (Husserl, B IX, 124). "It is my conviction that intentional phenomenology has for the first time made spirit (Geist) qua spirit the field of systematic scientific experience, thus effecting a total reorientation of the task of knowledge" (Husserl, 1970, Pt. III).

Inherently, phenomenology is not only related to art and aesthetics, but also to morals and intersubjective ethics as well as to "objective" bodily states and structures and behavior and inter-objective realties, thus linked to behavioral and "objective" science. Particularly, advanced phenomenology as outlined in the following part is fundamentally concerned with socio-cultural life as well as objective and inter-objective spheres.

With this orientation, the status of phenomenology in relation to hermeneutics, anthropology and structuralism, but also to autopoieses, empiricism and system theory as described in integral theory is questionable. Again this positioning needs to be investigated and scrutinized more thoroughly to enable an adequate integral post-metaphysics and integral methodology.

Part II: Advanced Phenomenology – Merleau-Ponty

The following outlines basic ideas of one of the most fascinating further developments and advancement of phenomenology, the philosophy of Merleau-Ponty (1960, 1962, 1988, 1995). He departs from the orthodox Husserlian conception of the purpose and scope of phenomenology. With him phenomenology realized particularly a *turn to the body and to embodiment* as a basic nexus of living meaning, as by virtue of being embodied we find ourselves always already situated to meaningful inter-relationships.

Correspondingly, Merleau-Ponty developed a rich variety of phenomenology emphasizing the neglected role of the body in human experience. Using Husserlian inspired methods of analysis Merleau-Ponty's overall ambition was to disclose the roots of rationality and Being. Close to Husserl he tried this through philosophy's efforts to reawaken an understanding of the original acts whereby humans come to awareness in the world. However, by extending Husserl's account of the "lived body" that is the body as it is experienced and experiences as opposed to the merely physical body, Merleau-Ponty resisted the traditional Cartesian separation of mind and body. Instead he developed the idea of the body-mind as the basic connection to the life-world, ever adjusting and constituting in inseparable bond with the vastness of experience and existence as a being-in- and towards-the-world.

Taking the body and embodiment as "base" his existential form of phenomenology addresses a wide range of embodied phenomena and bodily experiences, from perception, spatiality and motility of the body, to the body in sexual being and in speech and other embodied relationships to others, up to questions regarding temporality, and freedom. Correspondingly, Merleau-Ponty advancement of phenomenology strived for overcoming (or perhaps better to say undermining) the de-corporealization of the body and the neglect of embodiment, be refocusing on an extended understanding of experience.

Experience for him was no longer given to a subject, mind or consciousness, which could then be appealed to as substance within the world. On the contrary, the world is originally given and it is from this pre-subjective giveness that concrete definitions of the subject are formulated. For Merleau-Ponty the *body itself is already lived, meaningful and relational and intentional,* thus no longer merely a matter of cognitive consciousness. The life of embodied existence and interactive communication precedes and is the foundation for explicit and thematic consciousness. Importantly, Wilber confirms this embodied perspective as also for him "each state of consciousness is supported by a corresponding body, so that consciousness is never merely disembodied" (Wilber, 2000d, p. 151). [16]

Influenced and critically using insights by Heidegger and the Gestalt theorists, Merleau-Ponty is not only rejecting the modernist version of referentialist-representalism but critically refuting the dominating strands of Western philosophy and science; those being the empiricistic-objectivistic and the rationalistic-subjective paradigms. Both empiristic realism and materialism as well as rationalistic idealism (intellectualism), are reductionistic as they reduce live-worldly phenomena either to matter or to an idea.

Focused instead on bodily experiences and embodiment not as objects or representations but as constitutive and "open" media led him to an anti-foundationalism, anti-essentialism and non-dualism, and philosophy of *ambiguities,*[17] which marks his groundbreaking post-Cartesian and non-reductionistic approach.

With this orientation, Merleau-Ponty sought to rearticulate the relationship *between* "subject" and "object," self and world, mind and matter, culture and nature among various other dualisms through an account of the lived and existential body.

In terms of methodology, for Merleau-Ponty the phenomenological reduction remains incomplete or really incompletable. *Returning to things themselves* means for Merleau-Ponty going back to the way in which we experience the world before we begin to theorize about it. Returning to the life-world is to relate to the world in which an embodied knower meets in and co-creates with her *lived-in experience* the like-wise "embodied known" always already infused with meaning. Thus the program of the philosophy of Merleau-Ponty attempts to retrieve and integrate the experiential bodily processes and the embodiment as constitutive.

The embodied "subject" and his/her likewise embodied inter-subjective and "inter-objective" life-world are an extensive continuum, in which s/he is imbedded and actively and passively takes part. Therefore, neither subjective, inter-subjective nor objective dimension can be isolated from the dynamic process of embodied being and becoming. Mediated by the body and embodiment, human beings and "Being" itself "makes sense" of the inter-related realities of becoming in an on-going processes of transition of reality. As an unruly, unpredictable and unmanageable reality, the body and embodiment are decentring. Both are not only "mastering" subject and collectives, but also disrupting, undermining and escaping the purposive and boundary-drawing processes. With this orientation, bodily and embodied forces underlie the processual, dynamic and unfinished nature of any perceiving, feeling, thinking and acting.

---

[16] As for every state of consciousness, there is an 'embodied feeling' Wilber discusses gross, subtle and causal (formless) bodies as mode of experience or 'energetic feeling' which for him refer to supposed phenomenological realities as they present themselves to immediate awareness (Wilber, 2006, p. 25; 2000c).

[17] Because we are not capable of disembodied reflection on our activities but are a body-subject in an inexhaustible world we are living through, ambiguity is and remains as the heart of our experience. It prevails both in perception of things and all temporally situated forms of knowledge. We are always in the midst of the world and have no vantage point outside it. We can never achieve total clarity even in our reflective and critical orientation because we cannot fully penetrate the sources and origins of our meaning making, that is the primordial awareness in which meaning is always already constituted. Thus the irresolvable ambiguity is grounded in our bodily participation in being and on the paradox that we ourselves are constituted by the very being of which we become aware. As the world of lived experience is essentially indeterminate, ambiguous and opaque, it is not amenable to a complete and transparent analysis which is why for Merleau-Ponty, "ambiguity is of the essence of human existence [...] Existence is indeterminate in itself, by reason of its fundamental structure" (Merleau-Ponty, 1962, p.169). This orientation towards ambiguity and somewhat indeterminacy in Merleau-Ponty, leaves behind a philosophy of (self-)certain as classical phenomenology tend to be interpreted.

By means of our bodily insertion into reality, we are always already vitally responsive to the demands of our situation upon our body. This body moves in terms of pre-reflective "intelligence" and lived involvement, which exceeds our conscious awareness and control. Accordingly, there is a level of intentionality below that of explicit acts, which manifests itself in an active bodily engagement that is our primary rapport with the world.

For example "a movement is learned when the body has understood it, that is, when it has incorporated it into its "world", and to move one's body is to aim at things through it; it is to allow oneself to respond to their call" (Merleau-Ponty, 1962, pp. 138-139). An operative intentionality establishes and utilizes secret bonds of correspondence and interdependency, which constitute our reciprocal involvements. In this way of thinking the intentional arrow of classical phenomenology has become a two-way street of "interaction" as an "inter-experience" and co-constitution.

For Merleau-Ponty consciousness, the world, and the perceiving body are intricately intertwined and mutually "engaged" within an ever-present world frame and through the use of pre-conscious, pre-predicative understandings of the world's make-up. In ordinary perception we as body-subjects have a kind or pre-predicate, pre-objective and non-positing consciousness of our surroundings and our own bodies (Siewert, 2006, p.88).

Without falling into a pre-trans-fallacy,[18] this orientation opens up for a post-dualistic ontology, as explicated in the unfinished later works of Merleau-Ponty. Referring to a chiasmic, incorporated intertwining and reversibility of pre-personal, personal and interpersonal dimensions, Merleau-Ponty's indirect ontology of flesh, allows understanding phenomena more profoundly and relationally. For this understanding, we need to turn once again to the wonderment of this "eternal splitting open of Being into the touching and the touched, the seeing and the seen, the site of their differentiation as well as their union and intimacy" (Burk, 1990, p. 90). With this relational understanding it becomes possible to approach what does not appear, and yet which is the very condition for appearance.

---

[18] According to Wilber an uncritical use of a two-stage model of psycho-spiritual development can lead to one or both of the versions of the 'pre/trans fallacy': either mistaking pre-personal material as spiritual (the elevationist fallacy), or mistaking the transpersonal for pre-personal (the reductionalist fallacy) (see Wilber 2000a, p. 211). Thus there are two types, which either reduce the world of the Trans- to the world of the Pre- (PTF 1) or elevate the world of the Pre- to the world of the Trans- (PTF 2). The fallacy of conflating pre- and transpersonal realms can be related to both ontogenetic and phylogenetic development dimensions proceeding from pre-conventional, pre-rational, pre-egoic stages via conventional, rational, egoic stages towards trans-conventional, trans-rational, trans-egoic stages.

The patterns of meaningful being and action exist neither in the mind nor in the external world. They are neither subjective nor objective, but constitute rather a kind of world *in-between*, an inter-relationality of individual, social and trans-subjective practices. It is this between within an ontological continuity between ourselves, others and the natural world that needs to be considered. For Merleau-Ponty humans are integrated into the natural order, not as mere objects, but relations between humans and their world are intertwined or interwoven in the flesh of the world.[19] Within this fleshly being the in-between is as "fullness of void," understood as a creative and fulfilling emptiness.

Ultimately, it this in-between, which is the birth-place of intertwined individual identity, social and inter-objective knowledge, realities and creative relationships. With this kind of relational ontology advanced phenomenology is not only concerned with interiors, but provides a proto-integral interpretation, highly relevant for integral theory.

Advanced Phenomenology as Proto-Integral Philosophy

"Proto-integral" can be defined as both showing integrative potential, being on the way to an integral thinking and having the potential to further develop even compensate for weaknesses and limitations of conventional integral theory. Proto-integral potential means here, that phenomenology as a living and reflective philosophy, carries chances for an ongoing development towards serving and advancing integral research. Being proto-integral does not imply that phenomenology is a primitive or underdeveloped integralism. Rather phenomenology is a proto-integral in that it tries to make intelligible and integrate factual and possible lived experiences and realities in all its complex holonic interweavements and perspectives.

Furthermore, Merleau-Ponty's phenomenology is also proto-integral in that has opened up its philosophical reasoning to other disciplines including empirical studies, like psychology, cognitive science, neuro-science, linguistics, anthropology, sociology, political theory, cultural, literary and aesthetic theory etc. (e.g., Weiss, 2008).

Characterizing Merleau-Ponty's philosophy somewhat deprecatingly as "felt phenomenology" (Wilber, 2003, Excerpt C, Endnote 3) – which supposedly makes it seem difficult to cover intrinsic intersubjectivity as well as waves and streams – does not do justice, and even more is highly distorting and is undervaluing its proto-integral potential. Basically, advanced phenomenology does not (only) refer to the inner-world of transcendental consciousness and introspection. Merleau-Ponty utilized the phenomenological reduction espoused by Husserl, but without separating consciousness from the world, on the contrary he strives for re-integrating it as embodied. Accordingly, for Merleau-Ponty consciousness is always embodied consciousness. Furthermore, perception and experience interpreted by humans elicits meaning is embedded in a world that is physical as well as social. Thus human experience is actualized in the life-worlds of space, time, body, and human relation. Integrating the body and developing an elaborate understanding of embodiment this inclusive orientation provides the potential for reconnecting to the primordial origin, in a conscious and differentiated, yet reconciling way.

---

[19] Understanding "flesh, as a kind of originary absence" (Madison, 1992, p. 97) it is what makes the presentation of being-present possible, but which never presents itself as such. Thus, it is "non-space" of in-between, an "ecart," the gap, the separation, the differentiation between the touching and the touched, the seeing and the seen, mind and world, self and others. That gap of ecart, that space of corporeal difference is the "there is" within "the Being that lies before the cleavage operated by reflection, about it, on its horizons, not outside of us and not in us, but there were the two movements cross. . ." (Merleau-Ponty, 1995, p. 95).

With this proto-integral move, Merleau-Ponty's phenomenology offers a challenge to the internalism and mentalism of consciousness-bounded understanding. Integrally it shows, that consciousness exists only enmeshed in the world in which we do things and where we pursue social practices that facilitate our interaction with ourselves, each other and towards objects.

Particularly the aforementioned "inter-ontology" of a reversible chiasmic flesh-of-the-world, serves as basic constitutive and elemental medium of intertwined subjective, intersubjective and inter-objective processes. This relational and holonic orientation helps to overcome conventional subject-object dichotomy of retained Cartesian constructions. The danger of getting stucked in the somewhat implicit Cartesian dualisms in the heuristic analysis of the AQAL model requires a radical inter-relational holonic perspective.

Holonomically the whole is being intimately entwined with its parts and vice versa that is the whole comes into being through the parts, while at the same time the parts come into being through the whole. This implies that the whole can be encountered through the part, as well as parts can be seen in light and relation of wholes. Furthermore the whole can be qualified as which holds the parts together; or the way the parts belong together.

By going back to our actual lived bodily experience, we can (re-)discover the process of a holonomic inter-relating; a relational nexus of an "in-betweenism" (Kimura, 1988). Merleau-Ponty's indirect ontology of primordial *flesh* refers to a formative medium or milieu anterior to the conceptual bifurcation into the "subjective" and the "objective." It implies a chiasmic intertwining and reversibility, that allows for understand the holonomic process of what could be called inter-being (see also Nhat Hanh, 1998).

Merleau-Ponty´s indirect, ontology of reversible flesh reflects the inextricable intertwining of the body-subject with the world it inhabits – the inseparability of self-knowledge and object-knowledge in the midst of fields of situated, relational inter-corporeal in-betweeness at the brink of non-dual being. Metaphorically, this nexus refers to a textile or common tissue of meaning that is woven through all levels of experience, preceding and making possible all particular horizons and contexts. This elemental being manifests as a kind of silent and invisible ontological fond - out of which self, others, and things arise in reciprocal relations.

All inter-relational processes are always on the move between order and disorder that is always becoming; and never complete. As such it implies an active and ambiguous "immanent transcendence," carrying an utopian movement (Johnson, 2003).

With Merleau-Ponty, we can acknowledge the in-between of this becoming as a processual gap, as a corporeal difference (Weiss, 2000). Within this difference Being "lies before the cleavage operated by reflection, about it, on its horizons, not outside of us and not in us, but there where the two movements cross..." (Merleau-Ponty, 1968, p. 95). This living in-between, understood as creative and fulfilling emptiness is the speaking and knowing silence, pregnant with meaning.

Merleau-Ponty’s understanding of the relational constitution of becoming fosters a more processual integral perspective. Correspondingly, advanced phenomenology is helpful for the challenging undertaking to approach the inter-relatedness and dynamics of all spheres and entities within the integral framework. This implies for example a systematic up-grading of exteriors by holonomically interrelating internal, external, individual and collective interior meaning and exterior behavior as complementary. By this then behavior and acting as well as system exteriors co-create interior levels and states of consciousness as much as intentions and cultural dimensions among other interior co-create behaviorial and systemic realities. Accordingly, from an advanced phenomenological perspective, we need to see developmental values, depths and qualities also in the exteriors and in relation to the interior.

As Edwards (2004, 2005, 2009) has proposed, the right sides (“It” and “Its”) are not only an ongoing complexification of simple material and physical forms, but are multidimensional and an ongoing and dynamic process of creative emergence. Instead of the tendency to privileging interior (and individual) quadrants, and hence underestimating the relevance of the exterior (and collective) quadrants, what is needed is valuing the co-constitutive and co-creational inter-relationality of both and all. That is all forms of development and transformations are starting and are processed equi-primordially (“gleichursprünglich”) with both the interior and the exteriors as well as always already in-between both! Correspondingly, individual and social realities and processes are mutually inter-related and unfolding. Epistemologically and methodologically, this leads towards a kind of “inter-standing” (Taylor & Saarinen, 1994) the holonic “inter-be(com)ing” (Küpers, 2009). (Inter-)Being and Becoming thus “be(com)ing” takes places and realizes itself as an all encompassing “processual embodiment” which is more and different then a merely somatic interpretation, but refers to the very being *in* and becoming *towards* the world.

Actually, Wilber is using the very phenomenological term “being-in-the-world” for qualifying the major perspectives (I, We, It, Its) and the native or primordial perspectives (zones) as the inside and outside of interiors and exteriors in singular and plural. As he stated: “being-in-the-world is adequately nestled in endless networks of other beings in the world.” (Wilber, 2003, Excerpt C 45). With Merleau-Ponty‘s radicalized proto-integral phenomenology and relational ontology integral theorizing can even further and deeper consider the embodied relationality of its perspectivism.

For Merleau-Ponty’s advanced phenomenology the phenomenological space is an indigenous perspective that is embodied, embedded, enacted, and enfolded in other spaces, which for Wilber “makes the sum total of what is represented as the AQAL matrix” (Wilber, 2003, Excerpt C 46). Similarly, as for Wilber also for the later Merleau-Ponty “every perception of a sentient being is always already situated in relation to other sentient beings, and therefore every perception is actually housed in an indigenous perspective. Perception, awareness, consciousness, feeling-- none of those items exist per se…” (Wilber 2003, Excerpt C 46). In other words advanced phenomenology presents and situates perceptions and “knowledge of essences” and “universals,” never outside of a perspective. Like AQAL meta-theory, also according to the advanced later phenomenology and ontology of Merleau-Ponty, the Kosmos is built of perspectives, not only perceptions (Wilber 2003, Excerpt C 47).

As Wilber stated: "Integral Post-Meta-physics replaces perception with perspectives . . . all perceptions are actually perspectives, and all perspectives are embedded in bodies and in cultures" (Wilber, 2006, p. 58-59). Thus, sentient beings and perspectives, not consciousness and phenomena, are the "stuff" of the Kosmos (Wilber, 2003, Excerpt D). For Wilber (2006) there is no pre-given world awaiting perception only mutually disclosing perspectives awaiting (meaning creating) enactment that only exist relative to a sentient being; relative, to the subject that is doing the perceiving. And these subjects perceive corresponding to language systems consisting of signifiers that have specific referents, accessible only if those who are perceiving have developed to the level that contains the correct signified. In a process that Wilber (2006, p. 303) calls "mega-phenomenology" he outlines a schematic and generalized "GigaGlossary" that indicates world-spaces (on different altitudes) in which the referents of the major signifiers used by humans and capable of being "seen" by humans who possess the corresponding degree of consciousness to bring forth the correct signified.

However, embodied perceptions remain important as pre-reflexive way in and medium for manifested work of embodied consciousness. Therefore instead of merely replacing perception with perspectives (Wilber, 2006, p. 58) it seems important to recognize that both are mutually interdependend. Multidimensional, sensory, polymorphic and cultural perception, entrenched in historico-linguistic contexts and perspectives both are enacted as well as to take perspectives, requires perceiving them. In addition to emphasizing that all perspectives are embedded in bodies and in cultures (Wilber, 2006, p. 59), a phenomenological and phenp-practical approach integrates embodied perception with a perspectivism, that is perspectives are co-constituted and on-goingly co-created in a sensuous perceptional way, which hence make sense (Küpers, 2009a).

Against Retro-romanticism, but Differently!

Merleau-Ponty's critique against Cartesian dualism, separating subjects and objects, culture and nature, mind and matter, and his continuous emphasis on the relational flesh of the world, seems to suggest a revived romantic unity holism, similar to what some deep ecology approaches follow when they favour an all-encompassing identification of self with other species.

However, advanced phenomenology shares the well-founded criticism of integral theory related to retro-romantic approaches of questionable re-enchantment, which can be problematized as a single-boundary fallacy concerning the status of the somatic body (Wilber, 1995, pp. 697ff, 708). Conversely, advanced phenomenology does not make the somatic-sensory body mean experience in general or only a pre-conventional body. Therefore it is not falling into any descending one-sidedness nor regressive slides and fallacies re-contacting of body-id-in Gaia-approaches like Roszak et al. (1995) and other re-enchanting eco-philosophers tend do.

As understandable as a yearning for returning to a pre-reflective unity for the disembodied, alienated, rational modern and fragmented, relativistic postmodernism consciousness appears, there is no way back to a retro-regressive coincidence with nature or supposed pre-existing given Truths. Because the reversibility of being is always imminent and never realized in fact …" the coincidence eclipses at the moment of realization … " (Merleau-Ponty, 1995, p. 147) and relations to nature are always already culturally mediated.[20]

Rejecting any absolute claims on a specific, pure and authentic relation with "nature", Merleau-Ponty's phenomenology encourages an *a-Romantic* orientation and perspective on what nature is and mean. This does not exclude using Merleau-Ponty's phenomenology for investigating concrete, emotional and spiritual experiences people can have of the natural world, i.e. unbiased by either Romantic or dualistic worldviews (de Jonge, 2002).

Merleau-Pontyian ontology and epistemology provides indirect directions and approaches for example into the structures of relations between animals and humans, that go beyond an abstract division or mere utilitarian relations between the two. Accordingly, with Merleau-Ponty's phenomenology it is possible to discover many more ways and many more levels in which natural, humans and the "spiritual" world are related than traditional science or traditional philosophy could ever illustrate. Moreover, his phenomenology allows and embodies the development of sensitivities and senses of and for natural, human and "spiritual" qualities in their embodied incorporatedness and interconnectedness.

As referred to before, for this it will be imperative not to get lost in the pre/trans-confusion or supposed holistic but sub-complex unionism, and thus for advanced phenomenology and integral phenomenology differentiation is the necessary prelude to a deeper/higher and emergent integration (Wilber 1995, p. 472).

Here is not the space to discuss the complex status and application of Merleau-Ponty's phenomenology and his late ontology of flesh and environmental ethics and ecologies as for example outlined in the much discussed work of Abram´s (1997) spell of the sensuous or Toadvine's recent book (2009) on Merleau-Ponty's Philosophy of Nature.

But, what makes sense with regard to realizing a non-regressive phenomenological practice is a non-sentimental return towards actively developing our powers of reflective somatic consciousness (Shusterman, 2008) "so that we can achieve a higher unity of experience on the reflective level and thus acquire better means to correct inadequacies of our unreflective bodily habits" (Shusterman, 2005, p. 176). With Shusterman somaesthetic pragmatism offers a complementary perspective to phenomenological approaches, in that it provides more adequately a "full-bodied engagement in practical efforts of somantic awareness… generating better experiences for the future rather than trying to recapture the lost perceptual unity of a primordial past (Shusterman, 2005, p. 177).

---

[20] Already classical, transcendental phenomenology does not restrict empirical data to the range of sense experience, but admits on equal terms such non-sensory categorical data as conceptual relations and values. Phenomenology recognizes knowledge of the synthetic a priori, a proposition whose subject does not logically imply the predicate but one in which the truth is independent of experience, based on insight into essential relationships within the empirically given. In contrast to phenomenalism, it a position in the theory of knowledge (epistemology) with which it is often confused, Phenomenology – which is not primarily an epistemological theory – accepts neither the rigid division between appearance and reality nor the narrower view that phenomena are all that there is (sensations or permanent possibilities of sensations). These are questions on which phenomenology as such keeps an open mind – pointing out, however, that phenomenalism overlooks the complexities of the intentional structure of man's consciousness of the phenomena.

The Status of the Other

Discussing Groffian transpersonal experiences Wilber states: “all phenomenology fails: it takes the subjective and inter-subjective patterns doing the phenomenology for granted, and thus fails to disclose the processes and inter-subjective structures necessary for the experience to be able to unfold at all.” (Wilber, 1995, p. 771). As this was not correct in relation to Husserl, as shown before, this is neither correct to Merleau-Ponty, who remained close to and further radicalised the Husserlian concept of transcendental intersubjectivity. By this orientation the experience of the other has an integrative place in Merleau-Pontyian phenomenology.

From the perspective of advanced phenomenology it is through others that we develop into ourselves. Even more, it is through encountering the other that transformation as a holonic affair happens. There is always already a responsive inter-relational at work as an embodied social practice. Moreover, intersubjectivity is possible only because there is established an (pre-mordial) intercorporeality within the caring sensible.

Thus the cultural and historical world canot be understood in a way that is separate from the sensible and empathetic. Empathy, and dialogue as part of ongoing conversations are means of relating and articulating a sensible world that is “written” and “authored” already in human perception and expressed in language. Language in particular serves as a social medium that brings to full expression the mute inter-corporeal perception of the sensible, and, through this mediation, both are in a constant structuration, constant reversibility and interchange within the human experience of the lived world. We can enter the world of other human beings precisely because we are all part of a sensible and social world; a belonging that makes me believe that what another is seeing is but one more perspective on what I see, a variant of a common world rather than constituting another private world. Therefore, the reproach of a monological apprehension or prejudice is not justified. Wilber criticizes: “Rather, phenomenology (especially of the Merleau-Ponty variety) forms a type of foundational edifice … but its monological apprehension need to be supplemented with dialogical recognitions…” (Wilber, 1995, Endnote 738). He also stated:

> Thus, phenomenologists who claim that consciousness is always intentional (or always a consciousness of something), are still caught in a monological prejudice that abstract subjects perceive abstracted objects. They are “half-way” right, so to speak, which is that all manifest consciousness is always consciousness of. But that is still a low-order abstraction mistaken for the reality of the situation, which is that a first person is always already in a series of relationships with other first, second, and third persons, and awareness, consciousness, and feelings arise within those networks, not outside of them. (Wilber, 2003, Excerpt D Endnote 1)

However, an *adequate phenomenology*, as outlined in the following part, constitutively relates to dialogical and systemic perspectives, on second and third person levels. Analogue to an “adequate structuralism,” such an adequate phenomenology needs to be based on the insight that various phenomena follow patterns that do not themselves show up as phenomena, in naive immediate lived or even bracketed experience. An adequate form of phenomenology recognizes that the "subjective space" itself develops via inter-subjective patterns of dialogue and interpretive cognition (Wilber, 1995, pp. 28, 576ff, 583).

As discussed before, from the perspective of advance phenomenology the interior and the exterior, the individual and the collective are mutually interwoven with each other, they all co-create and communicate to each other and unfold together in a responsive and thus dialogical way. Accordingly a first person is seen as always already in a processual nexus of relationships with other first-, second-, and third- persons, which all are considered systematically in an integral "pheno-practice."

Part III: Perspectives on Adequate Phenomenology of an Integral "Pheno-Practice"

Pheno-practice here is understood as a special employment and application of (advanced) phenomenology, offering important perspectives on integral research and practice. Basically pheno-practice aims at further advancing classical phenomenology and its underlying, but limited ontological and epistemological assumptions and methodologies.

Like classical phenomenology, pheno-practice is driven by the intention to clarify and understand what is at issue; that is what appears as live-worldly phenomena and its various meanings as a complex inter-relating process. Pheno-practice is "practicable" as a style of concrete thinking and way to understand dealings with phenomenal reality. Thus, the practice of the pheno-practice refers to the ways in which human beings engage, individually or collectively, in grasping, holding, shaping, and forming the world in which they live, thus it is about meaning as an experience of everyday-life-world. With this orientation, situated practice is co-constituted in interaction of the embodied agents among each other and with the surrounding physical and socio-cultural environment. What kind of and how practices are realized is connected to the embodied conditions in which they emerge. Correspondingly, practice is an embodied, social, negotiated, complex process of participation (Wenger, 1998, p. 49).

Following the anti-essentialists critique against classical transcendental phenomenology, instead of reifying phenomena into external "objects," pheno-practice aims not to grasp the whatness of a phenomenon, but approaching the complex meaning relations involved. Pheno-practically, "essence" is a relational term that refers to intentionalities and responsiveness; that is to possible ways of encountering and relating before and while we understand or think them in conceptual thought or express them in language. Accordingly, a pheno-practical approach informs us that our primary and usual way of being-in-the-world is a pragmatic inter-action based on embodied personal, inter-personal as well as environmental and contextual dimensions.

Methodologically, a pheno-practical research approach takes a shift of mind to see interrelationships in their connections rather than linear cause-effect chains, and seeing processes of non-linear change rather than regarding snapshots for control and predictability. With this methodological focus, it emphasizes conditions of possibility and recognizes the multiplicity and interdependencies of poly-causal forces rather than simple causal explanation. This genealogical and processual orientation may then help to deal with the inherent problems and limits of atomistic, mechanistic and substantialist approaches, and simultaneously provides access to interstand relevant phenomena in the life-worldly practice.

Pheno-practice represents a specific integrally informed research framework and methodology, understood as a practice of researchers, striving to portray phenomena from the individual, communal and contextual perspectives of those who experience them and how they are embodied, while considering also the experiential involvement of the researcher. Thus, the primary focus, of pheno-practice, as a research methodology, is the understanding of the inter-relational structures, processes and meanings of lived experiential phenomena and perspectives. More than just applying specific methods of (classical) phenomenology and conventional qualitative research methods, pheno-practice provides also a base for a genuine integrative methodology of inter-relational practices for example for knowing and organization (Küpers, 2005, 2009). Pheno-practical methodology uses approved forms of co-operative inquiry (Heron, 1992, 1996) conducting research "with" rather than "on" people as co-researchers and creating a research cycle iterating through different types of knowledge, namely propositional, practical, experiential and presentational knowing for deepening experience and knowledge.

With all this an integral oriented pheno-practice provides a base for an extension of the conventional integral framework of Wilber (1999, 2000a, b), particularly concerning a more inter-relational understanding of developmental stages and lines in an holonic integral cycle, co-constituted by pre-subjective, pre-objective, pre-collective and pre-inter-objective dimensions

Developmental Stages and Lines in an Holonic Integral Cycle – H-AQAL

As known to the reader of integral theorists, the AQAL quadrant model uses a series of different developmental stages or levels and lines of development (Wilber, 2000c, d). Both levels and lines of development are essential aspects of personality with which people, but also "entities" need to understand themselves as well as for functioning and evolving properly further.

The *levels of development* refer to what is being developed (matter, body, mind, soul and "spirit") as generalized "waves" of existence. Thus, the levels are stages of development through which human beings proceed via a transcending, but also including, embracement and enfoldment (Torbert & Associates, 2004). With this facility the levels mark out new capacities and emergent qualities. Furthermore, these basic levels of consciousness unfold at different rates and can be seen as overlapping waves in a spectrum of consciousness.

The *"lines of development"* reflect innate capacities and functions within the stages. As such, they co-determine a person's ability to learn and perform successfully in various circumstances. The developmental lines concern complex developments, such as cognitive, emotional, interpersonal, behavioural, knowledge and learning developments or ethical/moral lines. Moreover, aesthetic competencies (musical, artistic, bodily-kinesthetic), among many others (Wilber, 2001, p. 246) are also part of this developmental process.

Lines develop over time through increasing complex levels of maturity, education and skill. But there are also "lagging lines" of development that represent specific areas of weaknesses or non-strengths. These under-developed capacities may be a limiting factor for the effectiveness of human functioning. Most of these lines develop in a relatively independent fashion at their own rate with their own dynamics. Some lines are necessary but not sufficient for the development of others; while some develop closely together (Wilber, 2000a).

Holonically both levels and lines of development are not only part of the upper left and right individual quadrants, but alike part of all collective spheres of cultures and systems. Moreover they develop simultaneously through all four quadrants. Inversely, quadrants exist in each and every personal, social or structural holon and show the relationships that exists within each holon. The inner and the outer as well as the individual and the collective co-evolve in an intimate cycle of mutual holonic interpenetration. That is a holonic identity arises as a result of the quadratic mutuality of both interior and exterior aspects of the holon. Such understanding allows an appreciation of the dynamic interpenetration of the inner/outer and individual/communal aspects, which occurs at each level of development for each and every holon. A holon brings these dimensions together in as a differentiating and unifying field of dynamic interdependence. The four perspectives of holonic reality do not merely co-relate or interact, they *co-create each other and co-evolve together*. Consequently, all reductionism via quadrant partiality needs to be thoroughly bracketed.

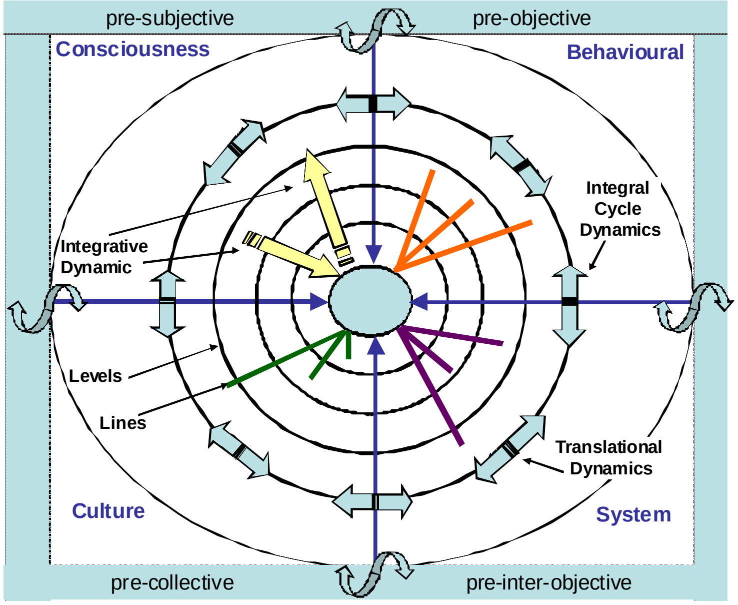

Figure 1. Levels and Lines of Development and Integral Cycle of Holonomic Pheno-practice

Holonomically, quadrants, levels and lines are energized by the dynamics of growth and integration and by what can rightly be called an “integral cycle” (Edwards, 2000, 2004, 2005, 2009). It is this cycle, which keeps all these elements hanging together in a coherent and dynamic system and co-ordinates the interaction between the four-quadrants and the holonic developmental levels and lines by an integral cycling and spiraling.

In addition to translational dynamics within each sphere and integrative dynamics, the integral cycle keeps all elements hanging together in a coherent and dynamic system. This capacity to analyze, categorize and synthesize the concept of an integral cycle in a pheno-practice a way of representing the mutual interpenetration of the quadrants and their constituent structures and the integrative and growth dynamic relationship that exists between the domains and its holarchic involutionary and evolutionary pathways. Moreover, being part of a comprehensive holonomic process, all quadrants stages and lines are also related pheno-practically to the constitutive *pre-subjective, pre-objective and pre-collective and pre-inter-objective dimensions*. These primordial pre-reflexive dimensions as described by Merleau-Ponty refer to the ways that pheno-practices are processed by pre-discursive capacities and experiential processes in a complex nexus of inter-relationships.

Based on this dynamic and holonomic understanding and as an integrative orientation pheno-practices gives equal attention to pre-personal, personal, interpersonal and transpersonal dimensions. It covers all, first-, second- and third-person perspectives of phenomena and its inter-relations and inter-dependencies. Rather than contending that any aspect or dimension is a (mono-) causal factor, an integral pheno-practice views all dimensions as constitutive of all others and accommodates them holistically in their inter-connectedness. Each of the four quadrants and the levels and lines of development would be incomplete without the others, and each depends on the others for its basic existence and sustenance. What is therefore needed is an approach that considers *Holonical(ly) All Quadrant, All Level, All Lines: (H-AQAL).* In these holonically intertwined spheres and through all its interrelations, the “be(com)ing-in-the-world” is energized, taking place and finding its time as embodied and enacted pheno-practice.

A critical pheno-practical reflection and practice is very much aware of the limitations and dangers of constructing or inventing a unifying representational scheme in relation to lived experiences, which are always more and different than what can be conceptualized. Therefore, the framework of pheno-practice, like the integral and other models, is just a perspective map, not to be confused with any ontological territory. But as a heuristic means pheno-practice might be helpful to appropriate a sense from what ultimately has already been understood and practiced. As as always preliminarily merely heuristic methododology it does not refer to an epistemically prior, unerring recipe that ensures compelling propositional results. Rather it understands method more literally as “following along a way” (i.e., “meta ton hodon”), thus it is a path that pheno-practical thinking and acting itself tentatively inscribes in attempting to disclose and come intelligibly close to the phenomena. Thus, the actual course of pheno-practical research is itself a lived experience notwithstanding following specific qualitative criteria of research for ensuring scientific rigor.

Thus not only may we situate lived experiences pheno-practically, we may also situate pheno-practical theorizing and ask ourselves where are we when we think? With this question, we are concerned about the experience of thinking itself and hence about where we stand and who we are in the very process of our pheno-practical theorizing.

Following a post-Husserlian orientation and a radicalized processual turn pheno-practical research investigates the influence that particular facts have on the emergence of (inter-)objects and of subjects and inter-subjective relations in their mutual interconnection. Accordingly, the central task in pheno-practical research is to demonstrate and makes approachable the reciprocal inter-actions and “inter-passions” among the inter-relational processes of reality constitution and situational practices within various modes of incessant tangled be(com)ing-in-/-towards the-world. This suits and advances integral studies as phenomena are constituted by inter-beings in a variety of situations, and events and activities.

As a genuine research frame-work, pheno-practice provides appropriate means for capturing and interpreting the dynamics of phenomena. In this sense, it strives to make accessible, describable, interpretable and practical the implicit and explicit settings and meanings of phenomena corresponding to the practical, processual, inter-relational understanding of and decentered perspective of phenomena.

The advantage of such pheno-practice is that it provides a useful approach to critic and counter-balance (gross and subtle) reductionistic approaches. Moreover, by offering integral and practical perspectives it also contributes to bridging the gap between theory and practice. Practically, each of the aformentioned elements of the integral framework (quadrant, level, lines, cycles) carries and demands various practical implications. These implications – not further elaborated here – are crucial for being realizing an integral pheno-practice in specific areas of application (Küpers, 2009).

Additionally, the practical implications helps also to respond to the conundrum of the entire phenomenological project: How can phenomenology be at once grounded in lived experience and faithful to it, yet transcend lived experience only to comprehend it, and in comprehending it, alter it essentially? How can phenomenology be simultaneously affirmative and transgressiv? On the one hand, phenomenology "seeks to recover a naive contact with the world" (Merleau-Ponty, 1962, p. vii) and to find truth essentially prefigured in lived experience itself. On the other hand, it "is not the reflection of a previous truth, but like art, brings a truth into being" (Merleau-Ponty, 1962, p. xx), transfiguring lived experience in the act of comprehending it essentially!

Although it relates and interprets meanings as already implicit in lived experience, pheno-practice does not simply iterate what is already given and understood in lived experience in the way that it is given and understood. Rather it seeks a transcending the understanding of the immanent, that is, it goes beyond lived experience to situate it, to conceive it more comprehensively, to judge it discriminatingly, and thus endow and transforms lived experience with new interpretation and meaning. This is possible, because pheno-practice is concerned with and relates respectively returns to already lived experience as the place where meaning originates.

Moreover, there is a transcending and transformative dimension already in lived experience itself, a dimension neither simply subjective nor objective yet in some sense always already understood. With this orientation, pheno-practice is more than simply describing things as they are given in themselves, neither as subjects nor as “objects.” Rather it strives for deciphering the origins of things in the whole system of experience, in order, as with art, "to show how things become things" (Merleau-Ponty, 1968, p. 181). In this respect, pheno-practice never purely coincides with lived experience in itself, but, by probing its ultimate horizons and seeking to grasp the englobing sense of what appears within them, renders lived experience anew and thus makes a transformative practice possible.

Though being faithful to lived experience, pheno-practice does not attempt to recover an experiential purity, as "one never returns to immediate experience" (Merleau-Ponty, 1968, p. 30). However, pheno-practice acknowledges that the intelligibility of the truth of lived experience precedes *a priori* the specific meanings realized within lived experience itself. Pursuing, pheno-practice constitutes a truth not yet realized, but within lived experience, thus altering the same: Expressed poetically: “We had the experience but missed the meaning / And approach to the meaning restores the experience in a different form” (Eliot, 1963, p. 208).

Accordingly, pheno-practice does not simply make clearer what is already known in lived experience. Nor does it simply abstract transcendental structures that account for the consciousness of “objects” in general nor for any actual “subjective” meanings within lived experience. Rather, pheno-practice elaborates fundamental possibilities of lived meaning inscribed as possibilities in the intelligibility of lived experience, as personal, interpersonal and “transpersonal” field of meaning. Neither simply copying nor complying with the realm of ordinary practical knowledge and ends, it seeks to discover an underlying “truth” ordinarily concealed or distorted in that realm; a truth in terms of which the essential meaning of the practical has itself to be determined. In this way, it neither repeats nor negates lived experience but reinstates it in its truth carrying its “immanent transcendence.” Through pheno-practical interpretation, lived experience comes, as it were, into its own for the first time as a conscious and transformative one.

Everyday dealings always have a prior context of meaning that situates and directs them, yet a meaning which recedes from focus in favor of involvements of members of organizations with the immediate objects of experience, cognition, and action. Presupposing a meaning already implicit in lived experience, yet that meaning is accessible and intelligible only by constituting it anew and thus transforming it. Consequently, pheno-practice locates transcendental truth in the original event of an immanent transcendence, the coming to be of the world as the integral context of lived meaning wherein, as embodied agents, we dwell, as spheres of meaning always already understood, arise, and differentiated in and through our human essence. One of the chief practical benefits of pheno-practice then lies in a re-form of and re-formulating of our understanding, which thereby in-forms as well as trans-forms the course of living.

The understanding that pheno-practical theorizing and research initiates and carries forward enables and situates what is done (or not done) in a more encompassing context of meaning. It thereby opens the possibility of acting more thoughtfully with a view to a more integral practice of wise conduct in life. Realizing transcendent meaning in immanent living experience effects a possible transformation, making possible well-founded and sustainable commitments.

Conclusion

The purpose of this paper was to situate in principle the "whither" and "whereabouts" of phenomenological theorizing in relation to integral theory and to develop perspectives and providing (ad)vantage points for further investigating integral dimensions.

The outlined advanced phenomenological and pheno-practical approach offers an important response to the following question: How can integral researchers situate themselves vis a vis their phenomena of interest in such a way that these most fully show themselves in and from themselves, and in their own ways of showing themselves in relation to the researcher? As described, the main purpose of phenomenology is a return to the "fundaments" of living experience as it happens, that is experienced space, time, body, and human relations as they are lived. Its aim is to relocate the primary point of contact between man and the world, to redirect philosophical attention to the primordial ways we perceive and enact the world.

Investigating the intelligibility of lived experience, phenomenology works systematically to recover the forgotten origins of scientific knowledge, to retrace a pre-objective intuition of "things themselves" and in their flesh and blood presence. A phenomenological and pheno-practical quest invites to rediscover the hidden intentionalities and meanings to examine their "essential" structures and potentials in an alter-native; proto-transformative manner. As a style of thinking, researching and enacting, phenomenology and pheno-practice can contribute to approach, re-conceive and interpret the experiential processes and practices within its complex inter-relationships. By purporting a return to the life-worldly experience pheno-practically, we can embark upon travelling "back forward" to what and how something appears, that is to the irreducibly relational and act-driven structure of experience.

In this sense phenomenology and pheno-practice are radical; a radicalism understood in the etymological sense of "going to the roots." Phenomenology is philosophical radical insofar as it seeks to penetrate beneath the abstractions and generalizations of science and practices and a culture dominated by science to reveal a underlying much richer world of lived experiences. In doing so, phenomenology is also socially and political radical, since it necessarily challenges both the hegemony of science and details of predominant scientific world views. While relating to lived experience, as a critical force, advanced phenomenology and pheno-practice are questioning wthat goes beyond everyday phenomena and conversations and concerns to comprehend them radically. By being a perpetually critical (self-)reflection and unfinished, and thus a continuous provisional "science of beginnings" (Stewart & Mukunas, 1990, p. 5) phenomenology pursues a tentative orientation which demands not only necessarily appropriating and reappropriating respectively letting go consciously its own beginning and the previous course of its thought.

Moreover, it calls us for re-learning to sense and look at the life-world as we encounter it in immediate experience; gaining fresh perspectives in seemingly familiar situations. Like all solutions in science, which radically reframe an open problem instead of trying to solve it within its original setting, phenomenology and pheno-practice have a "re-evolutionary" potential that is neither revolutionarily destructive nor evolutionarily conservative, but re-constellating radically the evolutional enfoldment. Accordingly, it can contribute to possible attempts for finding better and more adequate interpretations or alternative metaphors for experiences in a different and more creative way. Oscillating in the between of being and becoming, the stable and the fluid, the structures and the processes, established and emerging patterns, routines and creative action pheno-practice becomes an transformative inter-practice (Küpers, 2009).

Venturing “pheno-practically” into embodied, and with this emotional, cognitive as well as cultural and systemic dimensions of life-worlds, may be critically not only inquiring into, but also changing predominant practices and habits. With this transformational potential, it may provide viable means for researchers and other practitioners to generate theoretical and practice-related relevant insights and realizations for different embodied realities.

In a way, advanced and adequate phenomenology and integral pheno-practice are themselves answers to the question of finding methods which enable us to think and interrelate at the same time the externality and internality and their holonic interrelationship. From a post-Husserlian and integral perspective, the discussed phenomenologies are of course only *one* among others of the possible and philosophical and methodological approaches. In contrast to what Husserl sought, phenomenology does not have privileged foundational status. A self-critical phenomenology and pheno-practice must explore crucially its own phenomenality and relativity as one form of gaining knowledge and truth among others. Part of this necessary reflection is the effort to examine critically its own scope and limits and determine its meaning and ground. Accordingly, the "results" of phenomenology and pheno-practice have their force, not as a set of fixed claims passed on as correct doctrine, but as an interpretation of meaning appropriated and renewed in continued questioning and interpretation.

Nevertheless, advanced and adequate phenomenology and pheno-practice provide a highly significant potential for furthering integral research and practice. This kind of matured phenomenology and its pheno-practice are ready to take its “true-but-partial seat at the integral round table” (Wilber, 2003, Excerpt C 47). Facing the limitations of the classical phenomenology bound to a philosophy of (monolological) consciousness and of transcendental subjectivity, the discussed phenomenological and pheno-practical quest is part of the search for developing a post-metaphysical stance and understanding of holonic integral inter-connections and scientific and life-worldly practices.

As part of this quest, advanced, adequate phenomenology and a corresponding pheno-practice point to and invite to enter and pass through the gates into landscapes to be explored further. Both offer a map to orientate in the vast territories of be(com)ing-in-the-world. They help to navigate the journey through and towards unknown terrains. In their adequate forms, they holds considerable potential for guiding conventional integral studies out of its conceptual enclosures, methodological devices and habit-routines that often bind and unnecessarily constraints its approaches explanatory and interpretative power. By fostering an investigative questing for inter-standing phenomenal and relational ways of emergence, a phenomenological and pheno-practical philosophy and methodology offers supplementing and innovative research and practice options for approaching and relating to phenomena and events in more integral ways.

Correspondingly, there is a need for more rigorous theory building, further analysis and of course empirical testing. For example the combined use of phenomenology and pheno-practice may be used for additional research on various practices and processes for example related to embodied knowing and learning, aesthetics as well as organizing and managing respectively leaders and followership (Küpers, 2002, 2004, 2005; Küpers & Edwards, 2008; Küpers & Weibler, 2005, 2008).

Furthermore, combination invites further research on developing an integral methodology and integral methodological pluralism which recognizes and investigates embodied multiple realities, while acknowledging and incorporating different ways of knowing, and holonomic interrelations, valuing dynamic balances at many stages, levels and cycles. The integral methodological pluralism linked with advanced phenomenology and pheno-practice provides an even more refined epistemological orientation, which allows developing innovative conceptions of scientific research, and a more inclusive understanding of knowledge. Complementarily, the proposed pheno-practice contributes to corresponding meta-paradigmatic practice following the regulative principles of non-exclusion, unfoldment and enactment for conducting holonic research and integrating experiences as well as knowledge for achieving a post-relativistic multi-level inquiry, which is capable of taking different perspectives in an integral fashion.

It is hoped that the advanced phenomenological and pheno-practical research approach as discussed here provide actual possibilities to re-assess and investigate the deeper relevance and put in to a further developed integral research and practice. As such it can be used to supplement illustrate, highlight, interpret, deconstruct or re-conceive the experiential, structural, and processual dimensions of phenomenal processes. Even more, it partakes in and advances also more integral, creative and sustainable practices and well-be(com)ings (Küpers, 2005a).

Leaving behind the reductionistic “flatland ontologies” (Wilber, 1995) and researching phenomenologically and pheno-practically embodied personal, inter- and transpersonal dimensions and “lived experience” (van Maanen, 1990) in its complex holonic interplay is a challenging endeavor. But a worthwhile one, as it may contribute not only for the contemporary epistemic odyssey in research and practice as a passage out of pre-modern swamps of regression and between Scylla – the rocks of dogmatic modernity – and Caribdis – the whirlpool of dispersed post-modernity. Incorporating an adequate phenomenology and embodied pheno-practice into integral research may contribute to a better equipped and more critical journeying of this important endeavor. Offering important and enriching orientations both encourage and foster travelling into the enigmatic spheres of yet unknown possibilities of realising integral research and practice.

Not only are phenomenology and pheno-practice more and different than an “Upper Left“ or “Zone #1” affair, they also provide a tremendous proto-integral potential ready to be actualized. Truly integrated in integral research together they invite entering the within and the in-between of embodied selves, groups and communities their local cultures, regional realities and societies, natural environment and ecologies and even beyond those for realizing world-centric futures and unfold spiraling moments of our up-and-coming aborning cosmos.

What is the Integral in Integral Education?
From Progressive Pedagogy to Integral Pedagogy

Tom Murray

Abstract: Integrally-informed educational approaches have much in common with progressive (including reform, alternative, holistic, and transformative) approaches, and share many of the same values. One function of the integral approach is to provide an overarching model within which to coordinate different progressive methods. Though integral adds much more than that, descriptions of integral education sometimes sound like progressive educational principles recast with new terminology. This essay attempts to clarify what the integral approach adds over and above progressive educational theories. After an overview of progressive pedagogical principles, the integral approach is discussed in terms of integral as a model, a method, a community, and a developmental stage. Integral as a type of consciousness or developmental level is elaborated upon as consisting of construct-awareness, ego-awareness, relational-awareness, and system-awareness, all important to the educational process. Finally, challenges and support systems for realizing integral education are discussed.

Keywords: alternative education, education, pedagogy, integral education, progressive education, second-tier.

Introduction

> *Education is everything. We don't need little changes, we need gigantic revolutionary changes. Schools should be palaces. Competition for the best teachers should be fierce. They should be getting six-figure salaries. Schools should be incredibly expensive for government and absolutely free of charge for its citizens, just like national defense. That is my position. I just haven't figured out how to do it yet.*
> (Aaron Sorokin, The West Wing)
>
> *Education is a private matter between the person and the world of knowledge and experience, and has little to do with school or college.*
> (Lillian Smith)

"Integral" means many things to many people, and the same is true for "Integral Education." In one sense, integral has become a generic attractor for progressive (or reform or alternative) educational theories of all flavors. For educational practitioners and scholars, any particular school of educational thought may feel constraining and bound to a particular model or founder. The integral approach can embrace (and support a critical evaluation of) most of the values and deep principles embodied in progressive thought, and is thus not only compatible with them but offers a generous and welcoming meta-container. The integral model situates progressive educational ideas within a larger transdisciplinary web of ideas about culture, psychology, philosophy, science, etc., and also cleans up some shortcomings. Any particular theory can fit

SOME RIGHTS RESERVED

comfortably within the integral camp and have the elbow room to grow – and to play (not take itself too seriously). Likewise, the community (communities) of people who are drawn to integral theory seem to be "on board" with the key assumptions of progressive pedagogies, and, more importantly, seem to be more likely than not to embody what these theories are pointing toward.

Many who have been inspired by a variety of particular progressive pedagogies find their way to the comforting and energizing umbrella of "integral," which supports what they have in common and provides space and perspective on where they differ. Clearly "integral education" is more than the sum of these various theories (or the overlap among them). But it is not always clear exactly what "integral" has to add over and above these other theories. If you ask someone interested in the integral approach to education to describe it the response may not sound very differentiated from other progressive approaches, or it might be a description of other theories peppered with an "integralized" vocabulary, or repackaged in an AQAL model. When the integral approach to education is described in this "old wine in new bottles" fashion, as I have heard it described, especially by those enthusiastic and new to it, its legitimacy in the eyes of experienced educational practitioners, administrators, and theorists is jeopardized.[1] Therefore I think that it is important that those of us who write about or teach integrally-informed pedagogy are able to clearly differentiate it from existing progressive models, and articulate the "value added."

"Integral" can be seen as pointing to four things: a (meta-) *model* or framework (a system of concepts for interpreting the world), a *methodology* (a set of injunctions or principles for inquiring about the world), a *community* (the embodied group or groups of people using integral models and methods), and/or a set of skills or *capacities* (a developmental stage that points past modern and post-modern cultural perspectives, and past formal operational modes of thinking). In this article I will address each of these perspectives on what being integral means, in the context of education.

The central audience for this article are practicing educators and those who work with educators (such as administrators, curriculum designers, educational tool designers, and those who teach teachers) who are using or interested in integral approaches. The article may also be useful for integrally-aware readers in training, coaching, leadership, and other fields involved in intentional learning. My overall goal is to help us clarify, to ourselves and to others unfamiliar with integral theory, who we are, where we come from, and where we seem to be going as "integral educators." I start with a birds-eye overview of key principles of progressive pedagogies, then describe what the integral approach adds to these in terms of a model, a methodology, a consciousness, and a community. I discuss integral community in the context of responding to the challenges of realizing the visions of integral education. Along the way I will try to illustrate some elements of the integral approach by applying it "in situ" in my analysis. I assume that the reader has at least a passing familiarity with Ken Wilber's Integral Theory and the AQAL and Spiral Dynamics models (see Wilber, 2006, 2000; Beck & Cowan, 1996).

---

[1] For about 20 years I have participated in instructional technology R&D that applies new learning and cognitive theories to advanced computer learning environments. I have also taught graduate classes and facilitated teacher training workshops that explicitly use constructivist, inquiry-based, and other progressive pedagogies. My entry into the integral theory community about five years ago was motivated by interests in philosophy and systems approaches to the social sciences, not by education per se. I eventually connected with educators drawn to integral theory, and found that for some of them integral theory had been their primary doorway into the wider world of progressive pedagogies. The things that excited them the most about this new "integral" approach can turn out to be principles that are well-established (nothing novel) within progressive educational communities.

Integral + Education: Background

Though it is a new/emerging field, much has been written already on integral approaches to education. "Integrative Learning and Action: A Call to Wholeness" (edited by Awbrey, Dana, Miller, Robinson, Ryan, & Scott, 2006) focuses on how aspects of spirituality and "new ways of knowing" can be integrated into education. "Integral Education: Exploring Multiple Perspectives in the Classroom" (edited by Esbjörn-Hargens, Reams, & Gunnlaugson, in press) focuses on higher education and also takes various perspectives on the field as a whole. "Integral Education in Action" (edited by Dea, in preparation) is designed as a more practical (less academic) treatment aimed at practicing K-12 educators. Each of these books contains material that originally began as published articles in journals, conference proceedings, and other venues, so there have been several dozen papers in the field (Moltz, in press, gives an overview of related research studies to date).

For the interested reader, the chapter topics in these books include the theoretical and pragmatic roots of integral approaches to education (Esbjörn-Hargens et al.), case study reports of using integral approaches (all three books), specific advice for the K-12 teacher (Dea, in preparation), and a diversity of theoretical perspectives on integral education (Esbjörn-Hargens et al.).

This article contributes to this evolving inquiry by trying to clarify what integrally informed approaches to education add over and above progressive approaches, as no publication to date has had that specific focus.

Progressive Pedagogies

The mind is not a vessel to be filled, but a fire to be kindled.
(Plutarch, On Listening to Lectures)

Education is an admirable thing, but it is well to remember from time to time that nothing that is worth knowing can be taught.
(Oscar Wilde)

Education, therefore, is a process of living and not a preparation for future living.
(John Dewey, My Pedagogic Creed)

I will start by summarizing what I mean by "progressive" (or reform or alternative) pedagogies and educational approaches.[2] The term is mean to include the works of thinkers such as John Dewey, Jean Piaget, Lev Vygotsky, Rudolf Steiner, Paulo Freire, John Holt, Ivan Illich, Parker Palmer, Maria Montessori, Jerome Bruner, Jack Mezirow, and Howard Gardner, who developed alternative pedagogical theories in response to the perceived deficiencies of traditional institutional education, theories of learning, and social knowledge creation modalities. The theories and models coming out of these educational leaders include constructivism, Montessori schools, Reggio-Emilio schools, Waldorf education, transformative learning, un/de-schooling, and situated learning. It is not my goal here to compare or contrast each of these, but to point to what they share in a general sense, and how one can approach their totality and their differences as a system.

Below I list a number of categories of pedagogical methods, which are each elaborated upon in the Appendix.[3]

- Holism
- Multiple intelligences
- Creativity
- Individuality
- Constructivism
- Developmentalism
- Zone of proximal development
- Meta-learning
- Adaptivity/differentiation
- Learning by doing
- Empowerment and liberation
- Situated learning
- The ethical classroom
- Transformative education
- Community/service-based learning
- Lifelong learning and emergence
- Teacher presence and embodiment
- Participatory curriculum development and research

---

[2] I will use the terms progressive (or integral) "method," "approach," "theory," "principles," "world view," and "pedagogy" rather interchangeably in this article. They all point to more or less the same thing, highlighting different aspects of the thing. (I use the term "framework" only for Wilber's theory.)

[3] Though I personally agree with the importance of all of the principles and value-orientations listed, and even though many of the descriptions in the Appendix are written in prescriptive prose, it is not my intention in this essay to promote or prescribe any of them. In fact, like most educational principles, conclusive empirical proof of the efficacy of these progressive principles does not exist. Though many studies exist and some lend significant support, others are inconclusive or counter-supportive, and "the jury is still out" in terms of having abundant empirical proof. (Alas, this is true of almost every theory in education, therapy, economics, etc. – putting social science theories to work must happen with a humility befitting their limitations.)

The descriptions of these progressive approaches (see Appendix) comprise *theories* of learning (claims about scientific truths), prescriptive *practices*, and educational *values* (claims about how people should act and be treated).[4] Most progressive pedagogical models emphasize a handful of the above principles and values and are compatible with most of the others. While the Appendix simply lists these approaches with an explanation for each, I considered including an analysis that would compare and contrast them and categorize them into themes, but decided against this. Each of these principles points to an entire literature of inter-referencing papers and an entire community of practitioners and scholars, complete with journals and conference meetings. Further, each theory has become the central construct for a world of real practice. Since implementing theories into real educational contexts tends to require fleshing out a wide range of universally encountered concerns, in practice the full articulations of each of these approaches has much overlap with the others.

These progressive approaches cover a wide range of concerns echoed in integral theories:

- Addressing the many aspects of being human: body/mind/emotion/spirit;
- Including multiple holonic orders: the individual, aspects/parts of the individual, the classroom, the wider community and society;
- Allowing for multiple ways of knowing: in terms of "quadrants"– subjective, objective, intersubjective; and types – multiple intelligences, and so-called masculine and feminine modalities;
- Giving full attention to both internal realities (values, visions, feeling, motivations, relationships) and external realities (measurement, action, physical health, educational infrastructure);
- Seeing knowledge in terms of the coordination of perspectives (including critical approaches to knowledge and power, epistemic or meta-knowledge, and dialogic approaches).

As we will see later, though the above illustrates a significant overlap and compatibility between integral and progressive approaches, there are things the integral approach adds (for instance, except for a few exceptions, progressive approaches do not incorporate principles from modern theories of dynamic systems, adult development, or cultural evolution).

If you are a progressive-thinking individual you may find the list of progressive approaches quite appealing and bemoan the fact that public education is so far from these ideals.[5] If you are a teacher you may be thinking: "how the heck can any one person learn all of those principles – much less *practice* them?"

---

[4] I do not bother to try to differentiate truth claims from value claims here, though doing so is important in its own right (see Stein, 2008).

[5] The progressive educational principles, models, and value-orientations were developed in a social and cultural context that was critical of mainstream institutional forms of education. In the mirror image of each of the principles is a pointer to some elements of traditional education seen as detrimental, such as: knowledge presented as fragmented bits or in disciplinary silos, inadequately connected to real life practice and concerns; cognitively impoverished metaphors for learning such as the "pipe line" model; rout memorization, teaching to the test, and standardized curricula; hierarchical and oppressive forms of personal and institutional relationships; capitalistic, materialistic, and bureaucratic educational systems (see Feldman, 2008).

We will address the challenges of learning progressive (and integral) methods in the last Section, but here we can say that any teacher skilled in progressive pedagogical methods will be implementing a bit of this and a bit of that, and have familiarized themselves with a few but not all of these principles. The massive interconnectedness of these principles means that a skilled teacher might be working in alignment with many of these principles implicitly, as a matter of intuition more than explicit theory-application. It also means that a teacher in training can assimilate the gist of many of the principles simultaneously through mentoring with a skilled practitioner. This is not to say that a full understanding does not come from traditional academic-style study of the theories, from reading texts, taking advanced study classes, and attending conferences. Also, as we will note later, understanding and using progressive vs. traditional modalities (as well as integral modalities) assumes a certain set of developmental competencies.

Where's the "Integral?"

A main theme of this essay is that nothing in the progressive pedagogies listed above points to the uniquely "integral" part of integral education (or what integral theory brings to education). Above I said that integral can be understood as a (meta) model or framework, a methodology, a community, and/or a stage or phase of human development. Below I will explore each of these perspectives on what is integral about integral education.[6]

The section on models will focus on AQAL. The section on methods will mention "methodological pluralism," but also point to epistemic sophistication, and will be illustrated in the succeeding section using polarity mapping methods to coordinate the system of pedagogical principles. The section on integral consciousness includes discussions of second tier developmental capacities and integral consciousness as a state or way of being in the classroom. Then models of cultural and meme evolution are discussed, in part to related traditional, modern, progressive, and integral idea and value systems, and also to warn against the dangers of overusing such models. Finally, I discuss the difficulties in learning/teaching integral pedagogies and integral consciousness, and mention integral communities of practice in this context.

AQAL: A Framework That Transcends and Includes Progressive Pedagogical Principles

…Education forms the common mind. Just as the twig is bent, the tree's inclined.
(Alexander Pope, Moral Essays, 1735)

---

[6] It is worth noting that while Ken Wilber's Integral Theory (capitalized here) with its AQAL model is by far the most well known and influential integral model, there are many who identify their work with "integral" (not capitalized) who do not primarily base their work on Wilber's work. By integral theory, model, or approach I usually mean the body of work being developed in the greater community of integral theory and practice.

> *I think people are starved for a truly holistic and genuinely integral approach to the world—in psychology, in spirituality, in politics, in education…[Alternative] education in this country is at a crucial turning point. For several decades the counter-cultural and "new paradigm" thinkers imagined, with good reason, that they were fighting a lonely battle against conventional education. But in the last five years or so, everything has profoundly changed. Mainstream institutions…are now quite open to integral studies…*
> (Ken Wilber, from Shambhala Publication's "Interview with Ken Wilber")

For many readers "Integral" is, if not synonymous with Ken Wilber's work, strongly identified with it. Though Wilber's work consistently and brilliantly points to postformal, dialectical, metasystematic, and even (I hesitate to use a term so overused in the integral community that its meaning is ambiguous) "non-dual" ways of perceiving the world, Wilber has chosen to frame or package his ideas in terms of a formal-looking model with seemingly precise categories. His AQAL model, which includes the Four Quadrants (or 8 Zones), 8 Developmental Stages or Levels, 3 primary States, and a variety of Types of human capacities, should be familiar to most readers (see Wilber, 2006, for a description). (I assume that Wilber and his associates choose to foreground such a model because its benefits in allowing integral theory to "stick" with wider audience, and appear applicable to a larger range of domains, outweighs the problems (mentioned later) of using formal structures to promote postformal ways of knowing.)

AQAL is a meta-model that can hold within it the full set of progressive education principles, allow them to be compared, and set them in a larger meta-theoretical context. It can be the "kitchen sink" into which all of these ideas are thrown, and, more than being merely a conceptual container, it organizes them and clarifies core elements. Some of the listed principles focus on the understanding and development of internal mental, emotional, or spiritual capacities (the upper left quadrant); some prioritize collaborative, community, or ethical elements (lower left); some emphasize in-the-world action, the creation of artifacts, or physical embodiment (upper right quadrant); and others highlight the systemic factors in classrooms, the institutions of education, or social and political realities (lower right quadrant).[7]

Integral theory explains the massive overlap among the principles. In real systems (including people, groups, and societies) all four quadrants interact. In fact they are four sides of the same coin (if a coin could have 4 sides). The I, We, It, and Its of a system arise and develop simultaneously (they "tetra-emerge"). The four-quadrant model (and Wilber's eight zones or primordial perspectives) can be used as a diagnostic tool for assessing whether there are missing components in an educational situation.

AQAL's exploration of states vs. stages helps teachers in thinking about how to design experiences that induce states of mind that support learning. AQAL's elaboration of distinct lines and levels of development, types of intelligence, and states of mind (or consciousness) together incorporate the intuitions articulated in theories of multiple intelligences and the holistic approaches to mind, body, emotion, and spirit. This helps the educator avoid over-emphasizing any particular learning modality or pedagogical theory. In a later Section I examine the merits of evolutionary, developmental, and systems-theory approaches, which are central to AQAL and all integral approaches.

---

[7] One could describe the major insights of the integral approach in terms of two elements. The first is a deeper appreciation for and understanding of the *interior dimensions* of reality which have been neglected in many aspects of modernity. The second is in bringing the rigor of systems theory to holistic and transdisciplinary approaches. Systems theory brings insights about *structural complexity*, as in the understanding of systems as nested holons and with co-arising interior, exterior, individual, and collective components; and it adds insights about *dynamic complexity*, which includes the evolutionary and developmental perspectives so central to the integral approach.

Upper Left (I) *Educational Experiences* Contemplative Critical Somatic	**Upper Right (It)** *Educational Behavior* Skillful Practical Active
Lower Left (You, We) *Educational Culture* Connective Perspectival Ethical	**Lower Right (Its)** *Educational Systems* Ecological Social Global

Figure 1. Esbjörn-Hargens' Twelve Commitments of Integral Education

As an example of how the AQAL map can illuminate and organize educational themes, consider Sean Esbjörn-Hargens' (2007) table of "Twelve Commitments of Integral Education." It illustrates what he calls the "essential dimensions of an integral approach to education" by situating a mind, body, and spirit element in each of AQAL's four quadrants. The table describes twelve "forms of engagement…modes of interaction [and/or] ways of knowing the world."

Integral Methodology: Perspectives, Knowledge Building, and Dialog

> *Education is the journey from cocksure arrogance to thoughtful uncertainty.*
> (Kevin Huenison)
>
> *Education would be much more effective if its purpose were to ensure that by the time they leave school every student should know how much they don't know, and be imbued with a lifelong desire to know it.*
> (William Haley)

The AQAL model is as limited as it is powerful – in fact some of its limitations are *because* it is so powerful. It can trick one into thinking that it represents an accurate picture of reality when in fact, like all models, it is one interpretation of reality, presenting one way to categorize the elements of one's experience and understanding. When one tries to use it in complex real-life situations one sees that surrounding its clear and insight-producing distinctions are grey areas, square pegs one is forcing into round holes, and a diversity of opinions about the exact meaning and implication of the model's categories (these difficulties come unavoidably with any conceptual system). Wilber entreats us not to "confuse the map for the territory," yet assuming that reality reflects our constructs instead of the other way around is an ingrained human tendency difficult to avoid.

The integral approach (as articulated by Wilber and many others) provides something deeper than a categorical framework within which to neatly organize one's untidy reality: it suggests a certain attitude for how one can approach knowing, conceptualizing, and theorizing. It suggests not so much what *is* true about the world but *how* people can work together to discover what is most true, just, and useful in a particular context (i.e., it includes an epistemology as well as an ontology). This method or way of thinking is not as well-defined as the AQAL model, so the description of it will be something we circle around and weave through, rather than a crisp diagram of a model.

There is an increasing acknowledgement that in the modern context education should involve not only the learning of "content," i.e. information and specific skills, but also the learning of more general ("higher order") skills and knowledge. Among these are "learning how to learn," i.e. self-directed learning that reflects upon what one should be learning and how the learning process is going, and "epistemic" (or meta-) knowledge, i.e. some understanding of how knowledge is arrived at and the limitations of knowledge (Schoenfeld, 1985; Mayer, 1998). The integral approach requires this type of meta-level perspective on knowledge, method, learning, and doing.

The relevant modern (or postmodern) insights about knowledge include:

- *Complexity*. Many aspects of the world are highly complex. We need concepts from systems theory (such as co-evolution, chaos, non-linearity, and self-organization) to understand (1) the world in general; and (2) educational and learning processes in particular (Reigeluth, 2008).

- *Meta-perspectives*. For citizens to address the complex problems of modern society, educators must help learners develop higher level skills such as meta-cognition (thinking about thinking), meta-knowledge (knowledge about the nature and limitations of knowledge), meta-learning (learning how to learn), meta-dialog (dialog about how we engage in dialog). (See more in Murray, 2008.)

- *Knowledge as personal*. Knowledge, understanding, and "truths" are, at least in most instances, constrained by the world view, experiences, biases, perspective, developmental level, etc. of the speaker and listener (Polanyi, 1962).

- *Multi-methdology*. Different methods of observing (or inquiry or experimentation) lead to different conclusions or claims. Different disciplines tend to use different methodologies, leading to different conclusions about a phenomena. Each of these conclusions can be seen as valid perspectives on a complex reality, as opposed to opposing camps battling for the truth (Norgaard, 1989).

- *Indeterminism.* Terms, concepts, rules, models and theories all have a certain degree of "indeterminacy," i.e. fuzziness, uncertainty, or ambiguity in their meaning (Murray, 2006). It is often important to pay attention to the grey areas at the boundaries of seemingly precise categories or rules (Lakoff & Johnson, 1999; Mervis & Rosch, 1981).

- *Negotiation, ethics, and power*. Knowledge is constructed, or "negotiated," via communicative processes situated in authentic contexts. Truth-finding is an evolutionary process requiring dialog (Lave & Wenger, 1991; Habermas, 1998). Knowledge also has important moral/ethical aspects (Habermas, 1999; Kögler, 1992). The quality of knowledge building outcomes can depend on how carefully the knowledge building process pays attention to elements such as freedom, equality, empathy, sincerity, inclusivity, reciprocity, integrity and mutual regard.

How does a learner, "knowledge worker," or educator deal with the added levels of complexity and indeterminacy that come when she begins to acknowledge these insights? An additional set of methods are needed.

All of the insights listed above fall into what one could call a post-modern or progressive understanding and world view. As mentioned above, what I am listing under progressive blends into what I am calling an integral level (– as one example of the "indeterminacy" involved in creating categories). What constitutes the difference? For me, *progressive* involves identifying and describing the problems with traditional modes, leading to a critical attitude that is suspect of all claims and perspectives. It involve a discerning analysis about the nature of the problem(s), but for dealing productively with the problem it gives only vague advice or ends with acceptance or despair that things are so complex, unknowable, subjective, etc. An *integral* perspective, while not pretending to any easy or complete fix, does more to understand the nature of complexity itself, the nature of indeterminacy itself, and the nature of subjectivity itself, and is able to use this higher level of understanding to improve upon the situation.

If every perspective is like a lens or filter which distorts perception and inference, then we can correct for these distortions *to the extent* that we understand something about the lens or filter itself (turning subject into object, as Kegan frames it). At the integral level one is not only learning and using a set of pedagogies, but adopting a critical (and "appreciative") meta-perspective on those pedagogies. One is also noticing how one's *self* (including one's values and assumptions) fits into the system of teacher-applying-pedagogy-within-an-educational-system.

Returning to the theme of integral as a method or practice, many integral-level methods have been suggested for dealing with the issues (insights or problems) listed above. I will describe a few approaches:

> *Methodological Pluralism.* There are many types of perspectives on any situation, and getting a usable handle on something requires looking at it from multiple angles. Wilber has said "everyone is right," to indicate that all sincere perspectives and modes of inquiry, while fallible and limited, have something valid to offer. This "methodological pluralism" (Wilber, 2005; Murray, 2008; Norgaard, 1989; and see Feyerabend, 1975) is a multi-

methodological approach to scientific inquiry.[8] It includes a more precise understanding of the appropriate application of a range of methodologies (including objective scientific methods, subjective phenomenological methods, and intersubjective hermeneutic methods), the types of knowledge claims that each method can and can't make, and the relationships and synergies between them for mixed-method approaches.

Indeterminacy analysis. One can do more than simply acknowledge that concepts, models, and theories have limitations and involve fuzzy (or subjective or context relative) meanings. When one proposes a model, makes a claim, and uses a concept one can analyze how it degrades at its fuzzy boundaries. For example, if one uses the concepts like "holon" or "sentient" or "progressive" to construct clear categories, rules, or models, one can explain (even if parenthetically) how the claim changes under different possible interpretations of the central categories. This could include mentioning examples far from the central meanings (see Murray, 2006).

Polarity mapping is one method for dealing with the polarities, paradoxes, and dynamic nonlinearities found in everyday decision making. It is described and used in the next Section. (See also Murray et al., 2008 "Tools for Dealing with Uncertainty, Ambiguity, and Paradox.")

Methods related to ethical factors. Many processes exist for dialog and decision making that incorporate and value the inclusion of multiple voices and perspectives – to list them is beyond our scope here. Also, many knowledge building or inquiry methods contain both critical/analytical elements and dialogical/ethical elements. Elbow (2008) advocates balancing critical thinking ("the doubting game") with systematic or methodological believing ("the believing game"). He points out how critical thinking is often used as a tool to defend one's cherished beliefs, and suggests that we earn the right to doubt only after making an effort to enter into the other's world view (a skill also called "cognitive empathy"). Gaining a distance on one's strongly held beliefs is an exercise (exorcise?) involving ego. If one delves further into it, this also involves dealing with shadow elements. The integral community is familiar with many methods for gaining perspective on and loosening the grip of ego (for example contemplative practices) and shedding light on shadow elements (for example see the 3-2-1 Shadow Process in Wilber, Patten, Leonard, & Morelli, 2008).

There is space here to give only the few above examples of methods that are compatible with or implied by the integral approach to knowledge and education. The main point is that an integral approach should include methodological ways to deal with the problems in knowledge, indeterminacy, power, etc. noted above. Such methods should value and systematically incorporate multiple subjective, objective, and intersubjective perspectives.

---

[8] The AQAL model also describes a methodology called "Integral Methodological Pluralism" which basically advocates that a robust inquiry into a phenomena will include all or most of "eight primordial perspectives" based on the four quadrants (Wilber, 2006). Esbjörn-Hargens (2007) includes a description of applying the eight perspectives to educational research.

In the Fourth Grade?

The above descriptions may sound rather sophisticated, esoteric and philosophical. Indeed, as we will discuss later, fully working at an integral level requires a certain level of developmental skills. However, even though these skills mature later in life, they begin to develop early in life, and educators can do much to nurture this developmental process at all ages and stages. Let us briefly consider at how the philosophically rich issues and methods mentioned above can be simplified and brought into a fourth grade classroom. Imagine that the students are working collaboratively to research what to do on a school trip to Washington D.C. They gather information from diverse sources and have facilitated classroom discussions to decide upon (1) what is the case (e.g. how much gas will cost) and (2) what should be done (e.g. whether to stay at a campground or hotel).

If the activity is facilitated well, students can be learning: that knowledge is complex and perspectival; that knowledge has subjective (what I think), objective (what Wikipedia says), and intersubjective (what we all agree upon) facets; that words and rules may not have one single meaning and can be interpreted differently in different contexts; that biases and assumptions are hidden in beliefs and preferences; and that it takes a triangulation of different perspectives and inquiry methods to arrive at an adequate understanding or solution. It is not hard to imagine a teacher fashioning simplistic forms of Integral Methodological Pluralism, Polarity Mapping, contemplative practices, the Believing Game, and even indeterminacy analysis that apply to this age group.

Three Ways to Use Integral (or Progressive) Methods

I will mention three levels at which one can apply integral (or progressive) methods and models. First, one can teach them *explicitly*. That is, the students know that they are learning and using, for example, "the AQAL model" or "systems theory" or "the Believing Game." Second, teachers can learn these methods and models and use them *implicitly*. They can bring their knowledge of integral (or progressive) methods and models to bear in designing and running educational activities without explicitly mentioning these models or methods to students. In this case *teacher educators* would be facilitating teachers in learning these methods and models. Third, administrators, curriculum designers, or teacher educators can use integral (or progressive) methods and models to design the materials or environment that teachers work within.[9] Here teachers (and secondarily students) are benefiting from these methods and models without necessarily having learned them. These three levels are possible when teaching young learners, adults, and also for teaching teachers.

The point here is that integral (or progressive) methods and models can have a strong impact even if the student, or teacher, is not aware that they are being used. As we discuss later, integral is as much a type of consciousness or awareness as it is a set of models or methods. An integral learning environment might have an indefinable but recognizable look and feel, or texture of breadth and depth. It has been argued that people who work or learn under the implicit umbrella of a world view, milieu, approach, or type of consciousness will implicitly assimilate some of that world view or consciousness. I propose that when students or teachers are immersed in curricular, social, or administrative environments that are integrally informed, that the seeds of integral consciousness are being planted and nurtured.

---

[9] In addition, we can differentiate methods and models that were *designed* through integral consciousness from those that require integral consciousness to *understand* and adopt. It takes a higher level of development to conceive of and design a professional development program for, for example, constructivist pedagogy, than the level of development required to understand and implement constructivism in a classroom.

Returning to the list of 18 progressive pedagogies mentioned above, we can see that integral suggests a way to deliberate *about* these approaches. Though up to now I have emphasized the overlap and compatibility of these principles, there are real differences among these principles. Next I will illustrate one of the methods mentioned above: Polarity Mapping. It will also serve as an example of an aspect of integral *consciousness* (covered in the following Section), incorporating skill in dealing with complexity and apparent paradox.

Progressive Pedagogies as a Dynamic System of Principles

> *I believe that school makes complete fools of our young men, because they see and hear nothing of ordinary life there.*
> (Petronius, Satyricon)

> *[Public education is] the single most important element in the maintenance of a democratic system...The better the citizenry as a whole are educated, the wider and more sensible public participation, debate and social mobility will be…The most difficult and the most valuable is a well-educated populace.*
> (John Ralston Saul, Doubter's Companion: A Dictionary of Aggressive Common Sense)

> *The difficulty is the perception that [one is] dealing with a problem that can be solved by choosing either one or the other…fear of getting stuck in the opposite pole gets you stuck in your own pole…paradoxically, opposition becomes a resource.*
> (Barry Johnson, Polarity Management)

We already applied an integral sort of methodology above when we focused on utilizing the grains of truth in each principle ("they are all right"), mentioned how they tended to mutually support each other, and saw them as a complex system or dense meshwork of co-defining ideas. We can continue by shifting focus from the commonalities to the *differences*. Each principle emphasizes a particular theoretical perspective or value – they are ideals. Over-emphasizing any one principle or value may cause another to be minimized. Practical applications require tradeoffs and balancing acts. We can use "polarity mapping" (see *Polarity Management*, Johnson, 1996) to explore this situation. Here are some of the polarities or dialectical tensions within our set of progressive pedagogies:

- *Self-determination vs. helpful hierarchy*. There is a polarity between student empowerment and discovery vs. the need for teachers to skillfully employ guidance, limitations, expertise, and leadership. Traditional schools often underestimate learners' abilities to self-steer their learning experiences, but how far into the background does the teacher step?

- *Individual freedom vs. group needs*. There is a polarity between methods that focus on the individual student (meeting her needs, giving her a voice, supporting her autonomy, respecting her complex personal history) vs. methods that emphasize the group, the community, and caring about the needs of others. Sometimes a student's needs must go unmet for the greater good of the class. But at what level does that approach become oppressive?

- *Equality vs. special treatment*. There is a polarity between the desire to treat all students equally vs. the fact that students have a range of capacities and motivations. Should the most capable and motivated students be given extra resources? Should the most underprivileged students be given extra resources? If yes to both, where does this leave the middle?

- *Support vs. challenge*. There is a polarity between acknowledging the wonderfulness of every impulse and creative product that a student produces, supporting self-esteem and learning enjoyment, vs. the benefits of challenging him by providing cognitive or emotional disequilibrium. When and how does one tell a student that he is wrong, needs improvement, or is not stepping up to his potential?

- *Creativity vs. rigor*. There is a polarity between supporting creativity, play, and intuition, vs. teaching logic, critical thinking, rigor, and discernment. Both can be taught, but in any given activity or course one may be highlighted at the expense of the other.

- *Process vs. product*. Progressive pedagogy stresses learning to learn, higher order thinking skills, and the importance of good problem solving reasoning over getting the right answer. But usable knowledge must include some amount of "facts" and memorized procedures; real world performance often needs the "right" or "best" solution. How should education balance these poles?

- *Change vs. stability*. Progressive pedagogy values adaptation, dynamic flow, and customization. Yet to some degree people flourish when they are given clear stable constraints, rules, and/or boundaries. How predictable should the classroom experience, including teacher expectations, be for students?

- *Cognitive (mind) vs. social and affective (heart)*. Developing wisdom includes developing capacities of both heart and mind, and their skillful interpenetration. But in designing curriculum or activities priorities must often be made to focusing primarily on content and cognitive skills vs. social/emotional skills. In addition the educator must decide how these priorities influence her methods of evaluation, grading, and feedback (e.g. what type of evaluation and feedback to give to the student who tries hard and is a good team player, yet fails to grasp key subject matter concepts).

Now, in many situations the dichotomies described above are imaginary in the sense that the human needs that seem to be in conflict are in fact not, and there is an elegant solution that can satisfy both sides. However, these polarities are also real, in that real life decisions will often unavoidably benefit one side of the equation at the cost of the other. The perennial advice around such polarities is true: that practical application involves balance and compromise, and a forswearing of ideology and dogmas, even progressive dogmas. Postformal, integral, or "dialectical" consciousness can take us a bit further still. (Note that the above polarities are *within* the set of progressive pedagogies. As we discuss later, there are additional polarities to be mapped/managed/balanced when we include a full spectrum of traditional, modern, progressive, and integral pedagogies).

As described in polarity mapping theory, opposing poles of some situations are interdependent and mutually defining, rather than either/or choices or opposite ends of a spectrum (Johnson, 1996). Effective learning environments need change *and* stability, creativity *and* rigor, support *and* challenge, etc. Moreover, real systems are dynamic, so that a working solution at one point it time may not apply later. Let us say a teacher correctly evaluates a situation and decides to move in the direction of supporting more creativity (vs. rigor). After they begin to do so they will not know how *far* to go in that direction until they have gone a bit *too* far and the downsides of creativity and the importance of rigor start to come alive. Even if they find a perfect balance, when they move on to the next topic in the curriculum, or accept that additional student who just moved into town, or when the warm winds of spring start to blow through the winterized classroom windows, the appropriate balance point will shift.[10]

The solution is the development of a "dialectical intelligence" that is capable of constant (or frequent) assessment and awareness of the situation and flexible adaptation (Basseches, 1984). This includes an understanding of the dynamic tensions between the polarities and a perception of the whole as a dynamic system. This skill is one element of what we are calling "integral consciousness" or "second tier capacity."

Integral Consciousness

To teach is to touch the heart and impel it to action.
(Louis Sullivan, Kindergarten Chats and Other Writings)

We teach who we are…Good teaching comes from good people.
(Parker Palmer, The Courage to Teach)

Like progressive pedagogies, the integral approach has some roots in the Human Potential Movement (and in Humanism more broadly; see Hampson, in press). Both approaches (a) value multiple "lines" of human capacities and needs, (b) acknowledge how each person has a unique set of them, and (c) speak to the possibility of more fully realizing these capacities and needs. Yet unlike most of the progressive pedagogies, the integral approach draws heavily from both developmental theories and transpersonal psychology (with some clear exceptions indicated in the descriptions in the Appendix). From developmental theories we gain an appreciation not only of the abilities and limitations of *students* according to their developmental profiles, but we also gain an appreciation of the developmental requirements that the integral approach places upon *teachers* (in general, and upon oneself). From transpersonal psychology and its humanist and spiritualist threads (including "transformational learning"), we gain a valuing of the psychological and spiritual wholeness and adeptness of the individual teacher (which is itself developmental).

---

[10] In addition, just introducing a pedagogical change will affect the classroom system in unpredictable ways. A teacher takes a measurement of the class, compares it to some goal, sets a bearing in some direction and implements the change. But as soon as the change is implemented the landscape changes and both the measurement and the bearing are uncertain (in a type of social Heisenberg Uncertainty Principle; and see Reigeluth, 2008).

As mentioned in the introduction "integral" points to a capacity (a level of skill development also called Second Tier by Wilber, and closely related to Kegan's Fifth Order Consciousness) as well as a model and a methodology. In fact the most complete or appropriate application of the integral models and methods described above *requires* a certain developmental capacity.

Progressive teacher educators tend to realize that learning new methods requires personalized mentoring, patience, and the trial and error of extended practice. But still they are often befuddled by the difficulty some have in learning progressive methods. They may attribute it to a stylistic bent, or a learning (or communication) personality type, or cognitive type, or a deficit in "the system." However, though they have some appreciation of how constructivist and developmental principles apply to children, there is usually a lack of appreciation for the importance of (and limitations imposed by) adult development (along cognitive, epistemological, dialectical, social, and self lines). Thus, in strongly emphasizing adult developmental and transformational themes, the integral approach has much to add to progressive approaches. In this section I will describe some characteristics of integral or second tier consciousness as this developmental level applies to education. In a later section I will discuss more about the challenges in supporting practicing educators to develop this type of awareness.

Caveats Regarding Developmental Lines and Levels.

Before going further I need to back up and offer some caveats about the constructs of developmental "lines" and "levels" (or stages), constructs which appear prominently within the integral community. Both are approximate constructs that only roughly point to the complex phenomena that is human capacity and development. For example, even though for explanatory purposes I refer to Traditional, Progressive, and Integral pedagogies, these categories are fuzzy, and many of the principles indicated in our list of progressive methods reach well up into integral.

Regarding lines, some theorists hold that the sorts of developmental lines discussed in integral theory are largely artificial constructs, and that human skills/capacities do not form along neatly differentiated lines.[11] We speak, for example, of dialectical, emotional, epistemological, social, ego, and moral developmental "lines," but the capacities referred to have significant overlap, the distinctions being necessary evils to facilitate collective inquiry into the phenomena.

---

[11] Kurt Fischer, a leading developmental theorist, claims that skills develop (both genetically/phylogenetically and developmentally/ontogenetically) in response to the demands of real life task situations. He claims that "the skill level that a person displays…cannot be considered independently of the context in which that skill is assessed" [and also the context in which it was learned and the task the skill is meant to address] (Fischer & Farrar, 1987, p. 647). Some primitive human skills such as those dealing with reproduction, eating, and territory, seem to operate fairly independently of each other because the task situations or life-needs they address are relatively independent as well. Very specific and independent tasks also give rise to well-defined skills. But complex human social tasks/contexts such as teaching, communication, parenting, and leadership have massively overlapping characteristics such that

Regarding levels, though research shows that development tends to progress in waves (rather than linear progressions) that involve sub-stages of horizontal differentiation or accommodation followed by sub-stages of synthesis, generalization, or integration, these are observed rigorously only in tracking specific skills.[12] More encompassing levels like those referred to in Spiral Dynamics or Kegan's Orders of Consciousness contain many interacting skills (or lines), each developed at its own level, so assigning one single level to an individual is, though sometimes useful, also problematic. I will say more about the limitations of cultural value meme levels in a later section.

Give all of these caveats, the concept of general levels of development has significant explanatory and theoretical power. Just as it is useful to speak of traditional vs. progressive worldviews and ways of knowing, the concept of integral or second tier capacity points in a general way to an important territory of human capacity.

Aspects of Integral Consciousness

So what *is* this Integral Consciousness or Second Tier Capacity, and how does it relate to education?[13] Though there is no concise definition of these terms, the literature points to several aspects of this broadly defined stage of development.

Developmentalists have found that learning involves not only the accumulation and coordination of knowledge and skills, but a progression of qualitatively different relationships to, and capacities for, learning and meaning making. There exists a plethora of developmental models mapping various interrelated sets of developmental capacities (Wilber, 2000b compares some of them, as does Harris, 2002). I will draw from Robert Kegan's model, focusing on his "Fifth Order Consciousness," which has significant overlap with the concept of second tier thinking, and was derived from empirical studies.

Kegan (1994) describes five such "orders of consciousness." The progressive/alternative/reform/holistic pedagogies mentioned in this article are associated with Kegan's Fourth Order (and reach into his Fifth Order). Integral approaches are more centrally Fifth Order. Applied to the domain of education, learners at Kegan's Fourth Order are "self-directed" (or self-authoring, co-creative) learners who can examine themselves and their culture,

---

the skills developed to meet these needs should be expected to be equally interdependent and difficult to separate.

[12] These sub-stages also involve a dialectical oscillation between stable comfortable states and states of un-constituting and reconstituting disequilibrium.

[13] Steve McIntosh has published a book titled "Integral Consciousness" (2007). Though the book makes important contributions in several areas, I will not use it in this discussion because its use of "consciousness" is more about what one believes and values than about human skills and capacities. For McIntosh integral consciousness about an "integral worldview…a way of seeing and living [arising] from an enlarged set of values framed by an expanded understanding of cultural evolution" (p. 12). This sense of being integral is discussed more in my Section on "Cultural Evolution."

develop critical thinking and individual initiative, and take responsibility for their learning and productivity (p. 303). At full Fourth Order consciousness, individuals will have mastered skills such as these and, in the process, are likely to become advocates of such skills and be identified with them, believing that this level of skill is superior to others. Typically they will have practiced and identified with one or a small number of progressive schools of thought (from the many listed in the Appendix).

At Kegan's Fifth Order individuals begin to reflect upon whole belief systems, even their own Fourth Order beliefs, as limited and indeterminate systems. They begin to dis-identify with any particular belief system, and experience themselves as embodying a variety of evolving belief systems, surfacing in different contexts. Questions of "who am I" "what do I believe" "what is true" and "what is right" cease to have one best or optimal answer ("it depends!"). Rather than responding to situations by looking for optimal or "win-win solutions" (a Fourth Order approach), Fifth Order individuals see themselves as co-evolving constituents of each situation, and expect a problem situation or dilemma to transform *them* (they may continue to search for an adequate solution or approach to a problem—each developmental level transcends *and includes* prior ones, as Wilber notes).

Wilber and Beck & Cowan describe this "second tier" level of development as one in which individuals develop a working understanding of the developmental process itself and see the value of all developmental levels (all world-view systems) as coexisting within themselves (and others).

Kegan's model maps the interweaving development among cognitive (it), interpersonal (we) and intrapersonal (I) capacities.[14] Cook-Grueter's (2000) developmental framework describes second tier capacities called construct-awareness and ego-awareness, which are closely related to Kegan's cognitive and intrapersonal lines. In addition, Wilber's AQAL theory posits a systemic "its" perspective (or quadrant) in addition to the objective (it), intersubjective (we), and subjective (I) perspectives. Thus, I propose the following model for integral (or second tier) consciousness:[15]

- *Construct* aware (cognitive; "It" dimension),
- *Systems* aware ("Its" dimension; also a cognitive capacity, but reflecting on systems and networks of relationships as opposed to mental constructs),
- *Ego* aware (self/ego/will and being/spirit/essence; "I" dimension), and
- *Relationally* aware (emotional/social/ethical/interpersonal intelligence; "We" dimension).

---

[14] Also, though each developmental line influences the others at all levels, it would seem that at higher levels they become more blended or merged. There are clear implications for ego/will development implied in cognitive and emotional/social development at higher levels. Both coming to grips with the limitations of one's mind and opening to wider circles of compassion work to moderate the overactive ego.

[15] This four part model is offered as a rhetorical aid rather than a theoretical model—it covers the range of capacities I will refer to better than the other models cited. Being systems-aware is not strictly about Wilber's 4th quadrant, it is about perceiving systemic and meta-systemic relationships within and between all aspects (and all quadrants) of a situation.

I will only briefly describe each of these capacities here. Both the construct-aware and the systems-aware capacities are cognitively oriented and will be lumped together in much of what follows. One way to describe the cognitive skill spectrum is that it comprises a movement further and further away from linear black-and-white thinking, toward more sophisticated and nuanced modes of reasoning. This includes a deeper understanding or wider perspective on the function of language and thought itself. The developmental literature mentions three overlapping skills that, described below, can help understand second tier cognitive development.

Construct-awareness (Cook-Greuter, 2005) is basically what was described above as a flexible approach to the uncertainties, ambiguities, and paradoxes of concepts, language, and knowledge (it is closely related to what has been called dialectical intelligence (Basseches, 1984) and epistemic wisdom (Murray, 2008)). It is needed for integral-level methodologies such as the polarity mapping method described above. Cook-Greuter describes it as "becoming aware of the profound splits and paradoxes inherent in rational though [in which] good and evil, life and death, beauty and ugliness may now appear as two sides of the same coin."[16] *Metasystematic reasoning* refers to an ability to flexibly coordinate multiple whole systems of ideas (Commons & Richards, 1984; Ross, 2005). It is "meta"-systematic because it goes beyond the capacity to conceptualize and work systematically with ideas and within a system of ideas, to being able to move among and perceive reality through (or by coordinating) multiple systems of ideas. *Vision logic* refers to the ability to use forms of reasoning that are beyond formal logic and systematic thought (Feuerstein on Gebser, 1987). This includes reasoning *about* logic and its limitations, and also flexibly and intentionally tapping into more intuitive, unconscious, or "gestalt" ways of thinking (Keat's called it "negative capability").

Ego-awareness is easier to explain using non-technical language (Kegan's model highlights ego development and Cook-Greuter's model focuses on ego development). Cook-Grueter (2005) describes it thus: "This is the first time in development that the ego becomes transparent to itself. Final knowledge about the self or anything else is seen as illusive and unattainable through effort and reason because all conscious thought, all cognition is recognized as constructed and, therefore, split off from the underlying, cohesive, non-dual truth." Social/emotional "intelligence" is a significant aspect of integral consciousness, and in this model is implied as part of both ego-awareness and relational awareness.[17] *Relational awareness* will be explored more in the next section.

***Being* an Integral Teacher**

Embodying integral consciousness may not be as mysterious, sophisticated, or esoteric as it sounds. This inner capacity is touched when a teacher finds herself in a bit of a "pickle" in the classroom, for example, when two students are unable to work well together, and she is about to respond in her usual way, but then decides to pause, becomes quite inside and asks "OK, what is really called for here? What is the best for this class and for me right now?" – and then receives a quiet but sure insight about this social and interpersonal system that comes with that "aha!" sense of relief and confidence about what to do. This level of development also involves a way of being "with the flow" of life in which one can be consistently committed to concepts, values, and relationships, but also be able to gently and cleanly let go, listen deeply, and adapt when reality does not meet one's expectations or desires.

---

[16] Construct awareness also calls one to become "post-metaphysical" and avoid the "myth of the given" by loosening the grip that concepts, ideals, and models hold over one when one oversimplifies and distorts one's perception of reality to make it fit those concepts, ideals, or models. Integral consciousness includes coming to understand how one's own mind works, and perceiving one's thought patterns, beliefs, and shadow material as objects of awareness and inquiry.

[17] Kegan & Lahey (2009) and Goleman (2006) discuss the critical importance of social/emotional intelligence in real life situations, and how cognitive and social/emotional intelligences inter-penetrate and inter-depend.

As the above indicates, higher levels of personal development point not only to sophisticated or "higher" capacities, but to increased *depth of being* (related to ego-awareness). This involves being in touch with deep sources of self-knowing, intuition, empathy, compassion, and presence that is associated with wisdom and transpersonal modes of awareness. Otto Scharmer (2007) suggests that when one releases one's cognitive preconceptions and emotional attachments and settles into a state of open awareness and presence, one can unleash powerful potentials for creativity and growth.

The development toward these forms of wisdom involves an increasing ability to step outside of oneself and one's emotions, biases, and attachments. Such development along the "self" or "ego" line is implicated in all ethical/moral systems (including religions). It is not difficult to appreciate the importance of being able to put one's ego aside and have some sort of objective perspective on it when operating in a classroom, parent-teacher conference, or teachers' lounge. (For a more in-depth treatment of integral consciousness as a way of being in the classroom, see Chapters by Willow Dea and John Gruber in Dea, in preparation.)

This picture of integral consciousness is as much about a teacher's *state* while in the classroom as her *stage* of development. But finding consistent access to such states and understanding how to make the most of them implies a certain developmental stage. These states/stages of higher wisdom imply a certain ease, generosity, and humility that is usually developed in the course of life's challenges, as indicated in the following section.

Regular Old Consciousness

An obvious question is: "how does an educator interested in self-development move toward these capacities we are calling integral consciousness?" Later I mention the suggestions being investigated in the integral community, but here I will say something about a state we could call "regular old consciousness." So-called "integral consciousness" and related advanced levels of skill and states of awareness might be great to have, but with all of us there is much to be gained by noting what keeps us from being "normally" aware, alive, and intelligent in the classroom. Think about those days when you are relaxed and confident, enjoying your work, feeling connected to students and peers, knowing that your thinking is not clouded by emotional reactions, exhaustion, distractions, or worries. Gosh, that sounds good, doesn't it?

First, we can say that achieving a more sustained and sustainable degree of this "normal for a good day" (NFAGD) consciousness is more important and more achievable in the classroom context than working toward anything that sounds highly developed, super-sophisticated, or spiritually advanced.[18] Second, sustaining NFAGD consciousness is both a prerequisite for developing higher level capacities, and also implicates many of the same methods of practice. So working on sustained NFAGD consciousness is in many ways being on the exact same path as developing integral or second-tier capacities. Human development is a pretty natural process, as well as a very gradual one. It requires adequate *support*, which includes just minimizing the stuff that gets in the way of NFAGD, and sufficient *challenge*, which practicing educators don't have to worry about having – what could be more challenging than teaching?

Working on NFAGD consciousness is in part about horizontal development, leaning more deeply and consistently into existing skills, and in part about the work of healing, remediating, or tuning prior developmental levels.

Cultural Evolution and Individual Development

> *I have argued that blame, scolding, and punishment in public schools…can be successfully defended. Students have a duty to learn, and can be held responsible for violating whatever rules, policies, or instructions are enforced to ensure that they do so.*
> (Charles Howell - Education, Punishment, and Responsibility)

> *No use to shout at them to pay attention. If the situations, the materials, the problems before the child do not interest him, his attention will slip off to what does interest him, and no amount of exhortation of threats will bring it back.*
> (John Holt)

> *A bad teacher punishes, a poor teacher complains, an average teacher explains, a good teacher teaches, a great teacher inspires.*
> (H. Narasimhaiah)

I have described the integral approach in terms of both models and methods, and have noted that in a very general sense embodying the integral approach requires a certain developmental level of consciousness or capacity in several interrelated areas (including cognitive, relational, and ego). Integral theories point not only to a particular developmental level but also address developmental processes across an individual's life. They also strongly refer to the evolution of human capacities, values, and world-views (or cultural memes) through history. As this focus on individual development and cultural evolution is strong in integral approaches and is rarely seen in progressive approaches, I will go into it in a bit more detail in this section.

There are dozens of theories of human development and cultural evolution that integral theorists draw upon, and, in assuming the reader has some familiarity with one or more of them, my goal here is not to describe any of these in detail, but to summarize some of the main principles they share in noting what integral theory has to add over progressive educational approaches.[19]

---

[18] Discussion in the integral community tends to highlight vertical development (through successive stages), but there is also a high value placed on horizontal development. Development can not be rushed. Developmental theorists advise teachers and learners that at each developmental step individuals need plenty of time and practice to assimilate new skills and expand their scope to of application.

In the prior Section I described development in terms of three general threads of development: cognitive, ego (/self/will), and relational (emotional/social/ethical/interpersonal). Here, as a way to further clarify integral consciousness, I will describe the developmental path as is passes from traditional/conventional through progressive into integral/second tier. We will see how each of these three threads has a particular character related to reflective understanding and humility.

Development as a Path Through Disequilibrium and Humility

In the *cognitive* domain, one develops the capacity to understand increasingly complex situations, perceiving more subtle patterns, more diverse alternatives, and more abstract concepts. But at some point understanding becomes limited to how well one understands the instrument of understanding, the mind itself, including the fallible nature of concepts and generalities and the many ways that reason is unavoidably biased (Lakoff & Johnson, 1999; Wittgenstein, 1953; Murray, 2006). At first this leads to a profound dissonance as the foundations of certainty in knowing are shaken. Eventually one comes to an acceptance and appreciation of the limitations of one's knowing, and in so doing develops the skills in uncertainty, ambiguity, and paradox mentioned above.

In the *relational* domain, development progresses in several ways: an increasing awareness of one's emotional state and how it affects one's thinking; a deeper skill in empathy (and the imaginative capacity to put ourselves in another's shoes); and a widening understanding of the vulnerability-imbued interdependencies of social interactions. As this happens, the sphere of who one identifies with and has compassion for extends ever further out, allowing for, for example, compassion for one's "enemies" or those living lifestyles very distant from and different than one's own. This leads to a second form of profound dissonance. As one opens to the pain and suffering of wider circles of relationship, one can become over-sensitized and immobilized in situations that require difficult choices and compromises. Eventually one develops the emotional resilience and wisdom to make choices for the good of the whole (or the highest good, as one estimates it) even though a decision will cause some to experience pain or discomfort. One also develops the wisdom to (partially) discern how one's own assumptions or projections onto a situation cloud how one perceives the experience of others (that is, one's own unresolved psychological issues can lead one to draw faulty conclusions that others are suffering or are not suffering). This type of development focuses and purifies social and ethical actions.

---

[19] Except for the application of theories of childhood development (and the general understanding that learners construct their knowledge) there is scant application of the insights of evolutionary and developmental theories to the pedagogical principles generally accepted by progressive educators (in the Appendix). The notion that evolutionary or developmental history adds significantly to an understanding of the human condition seems obvious to integralists but it is only in the last century or two that the concept has found roots, and it is still a long way from being fully appreciated (Pinker, 1997). Some psychologists, scientists, and philosophers are still developing elaborate theories of how and why phenomena such as learning, motivation, or socio-political forces in educational systems operate without acknowledging that these phenomena owe much to evolutionary and developmental forces.

In the domain of *ego* development progresses from impulsivity through compliance with social conventions, and then into self-authoring where one increasingly becomes the master of one's beliefs, values, goals, body, and relationships. But again, at some point a dissonance is reached. One can only exercise so much control over one's life, one's body, and even one's thought processes and beliefs. One becomes awake to the profound levels of chaos and vulnerability in life – seeing that aspect of oneself that is like the small boat tossed by the waves or currents of forces large and unfathomable. One may imagine those forces to be random, impersonal, or divine, but in any case they are beyond knowing and control. On the other side of this dissonance is a will that comes from a deeper place of "knowing without knowing." It is a place that is more like listening than thinking or planning (though thinking and planning also happen), from which one taps or feels into a deep intuitive source.

These three general lines of development (cognitive, self and relational) have similar paths (though an individual might develop along each of them at a different rate). They all pass through egocentric/pre-conventional and ethnocentric/conventional/traditional phases to a more mature phase, but then, if development continues, must pass through an uncomfortable disequilibrium before emerging on the other side with an integral or second-tier type of flexibility.[20] For all three lines the transition out of the dissonance phase has an aspect of humility – a way of perceiving and coming to peace with one's limitations (and with life's inscrutabilities, paradoxes, and mysteries).

Having this perspective on development can allow teachers and teacher educators to shepherd learners through the difficult transitions on the way to second tier skillfulness.

Development of Skills vs. Values

The parallels between how individuals develop and how cultures or societies seem to develop is so striking that a number of theorists (including Wilber, Kegan, Torbert, Beck & Cowan, and Gebser) see individual development as recapitulating cultural evolution. There seems to be definite (but hard to capture precisely or empirically) relationships between the *capacities and skills* that individuals have (along cognitive, relational, self, and other lines) and the *values and world views* that they adopt. That is, the depth and complexity with which one can understand self, others, things, and systems (and thus their flexibility and adequacy in responding to life situations) has some influence upon what one is aware of and values. So in the integral literature we see terms like Traditional, Modern, Postmodern, and Integral along side with preconventional, conventional, and post-conventional; and ego-centric, ethnocentric, and world-centric.

These constructs can be applied (or misapplied) to students, parents, peers, administrators, local communities, and institutions. The menagerie of evolutionary/developmental terms not only describes different (but, again, overlapping) *skills and capacities*, but also describes an evolution of *values and worldviews*, each system mixing skills vs. values to a different degree. Though conflating skills and value development is somewhat problematic (see Stein, 2008), it has explanatory power, so we will proceeding with due caution.

---

[20] In fact there are sub-stages of disequilibrium that mark the transitions from any level to the next, but we ignore that here to focus on a particular manifestation of disequilibrium.

Caveats on Inferring Individual Development from Cultural Values

Wilber's AQAL model and the Spiral Dynamics model include the familiar color-coded developmental levels (e.g., red, blue, orange, green, and yellow value-memes representing ego-centric, traditionalist/ethno-centric, modern techno-achievement-oriented, post-modern/progressive, and early integral. These culturally scaled systems are able to emerge historically only when enough individuals in a given society reach a certain level of individual development (along cognitive, relational, and/or self lines). But once these cultural modes are established individuals at *any* level of development might find themselves attracted to them, often for differing reasons.

For example, if one encounters a student, colleague, or parent whose value system is predominantly progressive, one cannot use that fact to make a reliable estimate of their developmental level. There are ego-centrics drawn to the progressive culture because of its promiscuity and ethno-centric progressives who hold onto progressive beliefs with the fervor of a religion. Therefore I suggest not using the Spiral Dynamics model (or similar ones) to judge developmental level or capacity (or be extremely cautious in doing so).

It is best to think of individuals as having some degree of capacity in a *range* of developmental levels (Beck & Cowan, 1996 p. 63). Though some levels (Kegan calls them "meaning making structures") predominate in a person, individuals tend to function at different levels depending on the context. It is more difficult to access higher levels of development in situations that are more novel, complex, or emotionally challenging. The same individual can display a wide variety of developmental levels—in stressful vs. non stressful situations; and in groups that embody awareness and support vs. groups that reinforce developmentally inferior mindsets. In a sufficiently nonthreatening, familiar, and supporting context it is easy to imagine even a 12 year old showing the precursors so many second tier skills, such as: realizing that they have a bias about a subject and trying to step outside their ego and worldview to enter into another worldview (ego-awareness); or engaging in a polarity mapping analysis of a situation (construct-awareness).

All of this is not to ignore the real challenges and imperatives of human development, but to suggest that the seeds of integral consciousness can be planted and nurtured much earlier than might be thought. As implied above, applying and deepening these skills is often more limited by emotional and social factors than cognitive ones.

Transcending and Including the Traditional and Progressive

As noted by Wilber and others, many who advocate progressive (or post-modern) principles seem to be at war with the developmentally prior mind-sets called traditional/conventional and modern. We say that Green has a problem with Blue and Orange. The integral or second tier perspective allows one to understand the deep value of all levels and world views.[21] As I have indicated above, some progressive modalities were developed in reaction to the excesses of traditional value orientations, but all too often in progressive classrooms (or policies) the pendulum swings too far. The section on mapping the polarities of progressive educational principles implies that traditional/conservative (and "modern") values are as important as progressive and integral ones – it is a matter of maintaining the right dynamic balance.

---

[21] The thrust of the "integral movement" (if I might call it such) is to help more people (especially people in leadership roles including teachers) transition from a progressive ("green meme" or Kegan's Fourth Order) stage into an integral (or Fifth Order) one. The overall thrust is to support all humans of all levels to thrive at their current level and, when that level is not meeting their needs, transition to a higher one;

As practicing teachers know all too well, on the playing field of the real classroom traditional values such as basic skills, memorization, respect, self-control, loyalty, conformity, responsibility, and accountability, etc. are essential (as are modernist values such as efficiency, achievement, measurable standards, and resource accumulation; and pre-conventional/egocentric values such as self-protection and enjoyment).[22] The integral approach can help teachers *integrate* what progressive models prescribe with the realities of the classroom. It also helps teachers *understand* how particular students, classrooms, and even communities, have developmental differences that require very different pedagogical approaches. And it can help teachers empathize and *communicate* more effectively with students, principals, parents, etc. who have value systems different than one's own.

From Being There to Getting There: Pathways and Communities for Integral Educators

> *I am of the opinion that my life belongs to the community, and as long as I live it is my privilege to do for it whatever I can.*
> George Bernard Shaw
>
> *There can be no vulnerability without risk; there can be no community without vulnerability; there can be no peace, and ultimately no life, without community.*
> M. Scott Peck

To recap, integral models and methods can help practitioners coordinate a panoply of progressive pedagogical principles and can help them re-evaluate the importance of good old traditional and modernist pedagogical principles and values. The integral approach also adds meta-perspectives that can be used to more adequately and systematically address the values and goals behind progressive pedagogies. Adopting integral pedagogies involves not just the application of methods, but new ways of thinking (and meaning-making and being) that we are calling integral consciousness. I have also described how embodying integral or second tier capacity is part of a developmental journey. Now we ask: How does an educator step onto and develop along this path, and/or help others do so? What difficulties is one likely to encounter and what support strategies are available?

A full answer to these questions is beyond the scope of this essay, and because integral education is a very new domain of inquiry, these questions are still in early stages of being

---

however, the programs and rhetoric of most integralists indicates that the main audience are those at levels just below and above the second tier or integral threshold.

[22] And see Kegan, 1994, p. 57 on fundamentalist vs. humanist and developmental vs. non-developmental educational approaches.

explored by practitioners and scholars. In my brief comments I will start by addressing the challenges faced. Do you want the good news or the bad news first? —OK, I'll start with the bad news.

But first I should be clear in stating that, though I have been involved in progressive education and teacher training, have been part of the integral theory community, and have personally used integral approaches in teaching and learning, I have very little experience training others to use integral approaches and pedagogies in their work as educators (or leaders). Thus my comments here come from my analysis of what other intrepid explorers have reported, as well as my own intuitions about using integral approaches. See the references cited below for case studies and lessons learned firsthand in the trenches.

OK, now on to the bad news. Second tier consciousness is rare—and learning integral level pedagogical methods and teaching with integral consciousness is difficult. In fact, just moving from traditional to progressive pedagogical approaches is challenging. For most practitioners it requires teaching in ways that were not experienced in one's years of formal education. Kegan (1994, p. 274) in discussing trying to support the Fourth Order self-authoring/co-creative word view, notes how the literature "reflects a goodly amount of frustration, disappointment, surprise, and even, at times, disdain toward the large numbers of adult students who have difficulty achieving or who do not achieve these [skills]."

Above I mentioned the phases of humility-inducing disequilibrium that await those on developmental paths. Harris notes about supporting the adoption of second tier capacities:

> learning to reflect on and alter one's perspectives and behaviors can arouse feeling of fear, loss, guilt, anxiety, and anger. These emotions, if sufficiently strong, can elicit counterproductive defenses that block further learning. [Educators] lack strategies to help people manage the emotional distress when the old order is shaken… (Harris, 2002, p. 19)

(She follows by saying that "developmental theory offers a perspective that may help address this gap).

Supporting an integral (or progressive) approach is not just a matter of introducing new methods (Fosnot, 1996). Practitioners with stable progressive (or conventional) world-views may find it extremely difficult to "grok" or appreciate many integral (or progressive) educational principles, much less learn and adopt them (and see Steckler & Torbert in press; Gunnlaugson in press). Empirical evidence indicates that only a small percentage of people are at an integral or second tier developmental level (about 1/2 to 5% depending on how it is defined) (Wilber, 2006).

In addition, the classroom and institutional *logistics* of new liberating instructional approaches can be complex and can meet with resistance from peers, parents, and administrators.[23] During those frustrating days in the educational trenches one begins to appreciate the deceptive allure of the traditional hierarchical one-size-fits-all "factory model" of learning!

---

[23] Kegan notes that "the distinguishing feature of contemporary culture is that for the first time in human history, *three* mentalities [i.e., orders of consciousness] exist side by side in the adult population" (1994 p. 303).

Now for the good news, or at least some glimmers of hope. Actually I have been offering these glimmers of hope throughout the essay:

1. I noted how the integral approach could be used at the systemic level (administration or curriculum design), implicitly at the classroom level (using but not teaching about integral concepts), and explicitly (teaching integral ideas). So many can benefit while not explicitly learning about in integral approach.

2. Though it may be rare to find individuals with a developmental center of gravity at second tier, the skills and capacities of second tier begin to show up much sooner, and can be modeled and nurtured. I hinted at how integral pedagogical principles could be brought into a fourth grade activity of planning for a school trip.

3. I described how an individual can exhibit a wide range of developmental mind-sets depending on the level of stress, support, and developmental scaffolding of the context and group they are in. It may be difficult to advance a person's developmental level per-se, but it may be much easier to create contexts that allow learners' existing integral skills to flourish and expand.

4. I have described the integral approach as including models, methods, and capacities (skills or consciousness). *Models* must be explicitly learned. *Methods* are more powerful when explicitly learned but they can be learned somewhat through informal modeling and practice, where an approach or world-view is passed on through apprenticeship or even "osmosis" (unconscious learning). Integral *consciousness* is even more susceptible to being passed on informally through witnessing of and participation in contexts that embody it.

5. I described how educational practitioners could cultivate *states* and personal practices that support NFAGD (normal for a good day) consciousness, which, when it becomes connected with deep inner listening and cognitive empathy in the classroom, creates horizontal development and directly supports some aspects of the vertical development into integral consciousness.

The integral approach to education has many facets. It can involve using models like AQAL and methods like Integral Methodological Pluralism to support a metasystematic understanding of many pedagogies or of the multiple systems one is embedded in as a teacher. But these facets are for the cognitively oriented among us—those who like theories and abstractions and big-picture models (I must count myself among them). But the integral approach also involves a consciousness with "softer" facets, such as ego-awareness, construct-awareness, relational-awareness, and vision-logic that are really just ways of describing a type of wisdom—a wisdom just as likely to be observed in people who speak simply, don't display scholarly linguistic skills, and have no taste for abstract models.

I will share a story as a further illustration of item 2 above. Recently I was spending time with a 7 year old girl and her 5 year old brother who are close friends of my family. We were on an outing and watching two older children about 20 feet from us doing tricks on bicycles. The girl was observing with the keen eyes of an ethnographer. The boy wondered aloud about how they did those tricks, and where they got their bicycles. Since the older children seemed quite safe, I suggested that he could go over and ask them, and that I could help. Unsurprisingly, he felt too shy to do so and said "you do it." I asked "are you feeling too shy to ask them?" and he nodded, and again said "you ask them." I said I did not really want to do so by myself, and that perhaps I was feeling shy also.

Upon a moment’s reflection I added: "I could help you find out, but actually I'm not very curious about it. It’s like there is a part of me that gets curious and a part of me that gets shy, and when the curious part feels stronger inside than the shy part, then I might go over and ask someone something, but right now the curious part is not very strong and the shy part is medium strong." I was trying to teach something in that moment, and was actually saying it for the benefit of the girl, who is a bit precocious. Appropriate to his age, the boy was not particularly interested by this observation, but I could see that the girl was taking it in, absorbing it like a sponge.

I don't have a follow-up story illustrating how she assimilated it, but I would not be surprised if she began to work with this concept of having different parts of oneself that are in a constant state of negotiation and balancing. Even though the ego-awareness skill of disembedding from one's thinking enough to reflect on multiple inner "voices" is a second tier skill that many adults do not seem to have (especially in the contexts we think they need it the most!), the story illustrates that people can begin to learn such skills quite early in life.

So even though a small percentage (1/2% to 5%) of adults are centered at the integral developmental levels, the percentage of people who have a readiness to begin to develop some of the second tier skills is much larger (perhaps 25% of the population, probably at least 50% of teachers). There is much that the average teacher can gain from working with integral principles, including a more systemic and flexible understanding of classroom and institutional dynamics, a deeper more flexible understanding of thinking, learning, communication, and knowledge in general, and, as indicated above, a greater ability to coordinate and utilize a range of progressive pedagogies. They can also be supported in gaining a more flexible perspective on themselves and their teaching.

At the level of classroom activity, curriculum, and school system design and administration, the developmental and systems-level insights of the integral approach addresses how belief and value systems become stabilized and resistant to change through communicative processes and social structures. These insights can support sustainable transformation in classroom, school, family, and community systems (whereas an over-simplified grasp of these human systems, which can occur when progressive methods do not include integral level insights, can lead to solutions that cause more harm than good).

Communities of and for Integral Educators

To repeat our questions: "How does an educator step onto and develop along this path, and/or help others do so? What difficulties is one likely to encounter and what support strategies are available?" Above I described challenges and reasons for hope about the general question of helping educators (and their students) acquire and/or use what the integral approach has to offer. Next I address the question of what an educator (or teacher trainer) can do personally.

First let's state the obvious advice, the unsurprising basics that bear repeating: apply the attention and effort required to take good care of yourself—body, mind, and spirit. Balance high expectations that energize, with sufficient doses of compassion and acceptance for what is—with your students *and* yourself. Keep learning to deepen and broaden your understanding of yourself and your professional work.

Easy, yes? You may be thinking: "do you have *any idea* how busy a teacher's life is??" Eating well, exercising, getting enough social/emotional contact and R&R to "stay sane"—not to mention any sort of contemplative practice—seem hardly the norm for the average teacher. Verily, our social structures, from the expectations and compensation levels set up by educational institutions, to the cultural materialism and work ethic that keeps citizens on their daily tread mills, do not support this type of self-care and growth, especially for educational professionals. But you would not be reading an essay like this if you were not interested in stretching outside the status quo. So one additional crucial thing on the common list of suggestions is to build in community and peer support for your efforts.

As mentioned, there are communities of learning/practice associated with most of the progressive pedagogies in our list.[24] One "value added" of integrally-informed communities of learning/practice is that they explicitly value whole-self (mind/body/emotions/spirit; interior-I, exterior-it, relational-we, and systems-its) approaches to personal and professional development, and have developed methods and workshops toward this end. For example, see material on Integral Life Practice (Wilber et al., 2008). Many localities have integral salons or MeetUp groups.

---

[24] A look at the web site for the American Educational Research Association (the "world's most prominent international professional organization," with 25,000 members and holding an annual conferences attended by thousands), shows that among its 163 Special Interest Groups are many focusing on progressive topics, including: Action Research; Conflict Resolution; Confucianism, Taoism, and Education; Constructivist Theory; Cooperative Learning; Critical Educators for Social Justice; Ecological and Environmental Education; Holistic Education; Leadership for Social Justice; Multicultural/Multiethnic Education; Multiple Intelligences; Peace Education; Postcolonial Studies; Queer Studies; Service-Learning & Experiential Education; Social and Emotional Learning; Spirituality & Education. There are also a few that align with topics central to the integral community, for example: Chaos & Complexity Theories and Systems Thinking in Education. Surprisingly few mention developmental issues. Only one (Adulthood and Aging) mentions adult development, and three others mention developmental studies (Early Education and Child Development; Rasch Measurement; Constructivist Theory, Research, and Practice).

The integral approach, unlike approaches used in most other learning communities, contains an explicit inquiry into psychological growth and healing, and into contemplative practices (for example, the 3-2-1 Shadow Process and Big Mind voice dialog, Wilber et al., 2008). These are tools that can help clear away the psychological detritus that stands between one and the clear and easy states of mind implied by NFAGD consciousness, and the deeper states and stages implied in integral consciousness.

Though the integral movement has deepened and widened significantly in recent years, communities and programs supporting integral education are far from plentiful. Though a number of organizations exist that help professionals understand and use specific integral models, particularly AQAL, there are far fewer systematized opportunities to develop integral methodological skills or integral consciousness. For more information check out the websites for the Integral Institute, JFKU's Integral Studies Degree Program, Fielding Graduate University's Integral Studies Certificate Program, the California Institute of Integral Studies, Next Step Integral, and Pacific Integral (and see O'Fallon, in press, and Esbjörn-Hargens, in press, describing some of these programs).

Conclusions

Don't worry that children never listen to you. Worry that they are always watching you.
(Robert Fulghum)

Live as if you were to die tomorrow. Learn as if you were to live forever.
(Gandhi)

This essay has explored what the integral approach has to offer above and beyond progressive (or alternative, or reform) educational theories, principles, and values. We began with a kitchen-sink overview of progressive pedagogical principles and values. Educators who associate themselves with a subset of these principles and values and are wondering how to understand them as a whole, struggling with how to deal with the dialectical tensions among them and between them and traditional pedagogies, or intuiting that there may be a higher perspective, are likely to find something of value in an integral approach and integral community.

The "value added" by the integral approach was described in terms of integral as a *model*, a *method*, a developmental *stage*, and a *community*. The AQAL model was discussed as the most popular integral model being used, and I gave an example of its skilled application. I suggested that, though AQAL is useful and powerful, employing integral methods and consciousness is more important than using any particular model. I elaborated on the primary principles that integral emphasizes that progressive approaches do not: the development of human capacities and evolution of human meaning making (or world view) systems. The teacher with an integral perspective on human development will serve as a stronger facilitator of progressive (and integral and traditional) pedagogies. Successfully applying integral models and methods requires a type of consciousness or meaning making capacity, and I described "integral consciousness" in terms of higher levels of *construct*-awareness, *ego*-awareness, *relational* awareness, and *systems*-awareness.

In this paper I attempted to illustrate some aspects of integral methodology and consciousness in the presentation itself. I tried to open the reader to the full complexity and dynamism of educational systems. As a sort of construct awareness I described models, constructs, or principle without indicating "correct or best" ones, and allowed for the inherent complexity, uncertainty, ambiguity, and paradox (or seemingly opposite polarities) of the educational domain. I presented constructs and categories as perspectival, fuzzy-boundaried, strongly interdependent, or co-defining. I coaxed an awareness of the limits of the AQAL model, of theories of cultural/meme evolution, and of the constructs of Lines and Levels. I spoke to the challenges of supporting human development and the drawbacks of over-emphasizing it. My analysis addressed the system levels of student, teacher/classroom, and administrator/curriculum designer/teacher educator. At times I tried to explicitly insert myself as author into the picture, reflecting upon possible limitations of my perspective.

In the article I describe numerous elements of the integral approach—it is not a simple picture. Realizing a vision of integral education involves, as is only appropriate for an integral vision, a complex but dynamically flexibly and intuitively presenced process of engaging self, others, artifacts, bodies, and socio-cultural systems. I explored some of the challenges in learning and teaching the integral approach. Though these challenges are substantial, and though the integral approach is a complex thing with man "moving parts," I also argued that the seeds of integral consciousness and methodology can be planted and nurtured in many ways, and gave examples allowing for a good deal of hope in our efforts to create more integrally informed and integrally alive educational environments.

In addition to what is gained, something may also be lost in taking the integral approach. While it coordinates many different progressive principles, it does not (at least in my reading) specialize or deeply describe any. It may be best for some to adopt an integral approach only *after* being mentored and immersed deeply in one (or several) specific progressive methods.

I mentioned several integral level pedagogical approaches in the Section on integral methodology, but one might still ask: *What does integral pedagogy, or an integrally informed classroom, actually look like?* What uniquely integral methods would we see being used there? One could point to a specific method or model used to anchor an integrally informed classroom. For example, students may be systematically investigating the world from each of Wilber's 8 perspectival Zones. But that would be overly constraining our vision. An integral curriculum would be so much more than that, and would actually include, most of the 20 or so principles listed as progressive pedagogies. In fact, a teacher who has a sophisticated grasp of progressive pedagogy, who has never heard of integral theory, would probably be observed to intuitively be employing most or all of the 8 Zones. (Of course, an integral approach can help one better understand what one is doing and transfer their wisdom to others.)

What I would like to propose for this historical moment in integral pedagogy's evolution is that the integral approach points not so much to a new set of methods, but to a way (or ways) of coordinating, integrating, practicing, and embodying already existing specific methods, mostly from progressive approaches, but also including traditional (and "modernist") approaches, as appropriate. Integral looks and feels like progressive methods applied with wisdom and "adequatio," with an ego-aware and construct-aware consciousness.

I have purposely avoided trying to define "integral" in this paper (I do give it a shot in Murray, 2006). For me integral is an emerging wave of human capacity, difficult or impossible to define but still tangible and recognizable. It is a form of human understanding and skillfulness that takes the insights about the human condition, the critiques of existing systems and mores, and the experiential openings in human capacity that we associate with the progressive and New Age movements, and adds new levels of rigor, reflective self-and-system understanding, and hope to the possibilities of improving the human condition.

In the domain of education, the integral approach is not just a new set of beliefs about teaching and learning, it also indicates new ways of being in the classroom and making meaning of the educational process. In this sense, it is not a theory to be taught but a pointer to a naturally occurring next wave of human capacities. These capacities are desperately needed to meet the complex and urgent problems of the times. For many educators then, what is of ultimate concern is helping learners, global citizens and future citizens, move vibrantly toward developing these capacities.

Thomas J. Murray *is an independent scholar, consultant, and research scientist in the areas of Cognitive Tools, Adaptive Computer Learning Environments, Online Collaboration, Ethics, and Knowledge Engineering. His research and teaching work are primarily at Hampshire College (Schools of Cognitive Science and Natural Science) and the University of Massachusetts (Adjunct Faculty member of the School of Education and R&D in the Computer Science Department and the Center for Knowledge Communication.) He is currently an independent consultant working on projects with several organizations. Recent interests and work on aspects of the Perspegrity project include, on the practical side: supporting higher quality communication, collaboration, and decision making in online communities (see Perspegrity project), and on the theoretical side: studies in areas of applied philosophy, related to "epistemological indeterminacy" and cognitive tools supporting metacognition and ethics-oriented reflective dialog. Murray has degrees in educational technology (Ed.D., MEd), computer science (MS), and physics (BS). He is on the editorial review boards of two international journals, the International Journal of Artificial Intelligence in Education, and at Integral Review as an Associate Editor.*

Appendix – An Overview of Progressive Pedagogies

I assume that the reader is familiar with a handful of progressive educational models, assumptions, and value-orientations, and give only a brief summary below. Even though they seem like separate principles, each one has significant overlap with many others, as there are many ways to "cut up the pie" that constitutes the common appreciation of progressive pedagogy. In real world application the lines between these principles blur significantly.

- *Holism:* An acknowledgement and appreciation of the "whole person" or "whole child" – mind, body, heart, spirit, and community are all interconnected and important. Artistic expression, bodily movement and health, spontaneity and fun, interaction with the natural world, and service are as important to creating good citizens and realizing students' full potential, as is the learning of "content." The physical arrangement of the classroom, what a student had for breakfast, and whether he has caring parents seeing him out the door, all affect his learning and engagement.

- *Multiple intelligences:* All forms of intelligence should be acknowledged and nurtured; and each student may have her own path to learning due to some of these lines of development or styles of learning being stronger than others. (Gardener, 1983)

- *Creativity:* Success in the world, especially the complex modern world, requires creativity ("lateral" thinking, "right-brained" thinking). This includes considering multiple hypotheses, or alternative solutions, or perspectives, and not committing rigidly to any one too quickly. Nurturing creativity requires bracketing the logical mind and opening to other forms of "intelligence" (deBono, 1970; Polya, 1973; Robinson, 2001).

- *Individuality and human potential:* Each person has a unique set of capabilities and potentials, and something unique to offer the classroom and the world. Learners should be treated and respected as unique individuals.

- *Constructivism:* Each person constructs their knowledge in a unique way, depending on their prior knowledge, preconceptions, and experiences. Meaning making is idiosyncratic and personal. Instruction must move beyond the "pipeline" theory of learning that assumes that if curriculum could only be organized and presented skillfully enough, the result will be that one learning path will fit all students. (von Glasersfeld, 1995; Collins et al., 1989)

- *Developmentalism:* Learning happens through natural processes such as integration and differentiation, or assimilation and accommodation, or horizontal and hierarchical learning (depending on the theory). This puts limits on the speed of learning (it can't be pushed too fast) and the order of learning (some concepts and skills necessarily come before others). (Piaget, 1972; Fischer & Farrar, 1987; Commons & Richards, 1984)

- *ZPD:* Instruction should aim for that 'zone of proximal development' that has the right balance of support and challenge to avoid the extremes of boredom and being overwhelmed (Vygotsky, 1987; Murray & Arroyo, 2002).

- *Meta-learning:* In today's dynamic world one needs to "learn how to learn." One also needs to think about thinking (metacognition), and understand the nature and limits of knowing (i.e., have epistemic knowledge). Education should strengthen the learner's ability to monitor, reflect upon, and adjust problem solving processes and outcomes on the fly. (Schoenfeld, 1985; Winne, 2001; Kegan, 1994).

- *Adaptivity/individualization/differentiation:* The content, style, and speed of curriculum should allow for, adapt to, and/or differ for the various types of individual differences noted above. This can be done by dynamically steering the instructional path to respond to individual student needs, and/or by immersing learners in open-ended environments that support many paths (Tomlinson, 1995).

- *Learning by doing*, case-based learning, situated learning, discovery learning and inquiry learning: Progressive theories say that learning activities need to be authentic, rich, or realistic enough to engage student motivation and allow for transfer to real life problems. Taking guesses and making mistakes are seen as normal, inevitable, and positive. Learning that comes from real engagement and curiosity is far superior in depth and longevity to rote memorization or cramming for a test. One learns by designing and building things, playing and getting our hands dirty, and trial and error.

- *Situated learning:* Most authentic learning happens in social contexts, and often through apprenticeship or mentoring relationships. The social fabric and dynamics of the learning context are critical success factors. Collaborative learning is beneficial, as are peer learning and peer tutoring. One learns by showing, explaining to, questioning, arguing with, negotiating with, teaching, and helping others. Social and emotional intelligence are as important to learning as intellect. (Brown et al., 1989; Lave & Wenger, 1991; Vygotsky, 1978).

- *Empowerment and liberation*. Education happens largely through institutions that perpetuate habits of disempowerment, oppression, conformity, orthodoxy, and life alienating thought forms. (Freire, 1970; Illich, 1975; Rosenberg, 1999; Ewert on Habermas, 1991; Dewey, 1926; hooks, 1994). Education should be designed to support the ideals of freedom, equality, self-determination, justice, and open mindedness that enable democratic society. Students can be given more choice and power over what and how they learn; they can be supported in acquiring the skills of dialog and conflict resolution. Teachers can relinquish some control and reveal their areas of ignorance and uncertainty; they can be "guides on the side" rather than "sages on the stage."

- *The ethical classroom.* If the classroom is a learning laboratory for life, then it should support things like compassion, caring, respect, empathy, and dialog; and it can model quality relationships and community building. (Palmer, 1998; Elbow, 2008)

- *Transformative education*. Some focus on education as a vehicle for spiritual growth, the flowering of human potential, and/or the evolution of human meaning-making capacity (or action-logics, see Torbert, 2004). They suggest that the classroom can support contemplative, transpersonal, and transformative experiences. (Mezirow, 1991; Steiner, 1965)

- *Community/service-based learning.* Community-base and service-based learning are strongly situated and have ethical implications. Connecting schooling more tightly with family, community, and society has clear benefits for students and allows learning through doing to directly benefit the larger whole. It engages multiple intelligences and modalities, and gives students a sense of empowerment and purpose.

- *Lifelong learning and emergence*. We never stop learning, or at least need not stop. This is true because of the constantly changing social and technological landscape. And it is also true from the perspective of human potential and emergence. Expertise, wisdom, leadership, and innovation are continually deepening skills developed over years of adult life.

- *Teacher presence and embodiment.* Of critical importance is how teachers and other leaders embody and model the qualities they intend to teach and support. This highlights the critical and too-neglected fact that educational reform requires significant investment in teacher training. In addition, the deep qualities of compassion, presence, metacognitive reflection, and mind/body/emotion/spirit integration cannot be "taught" in a teacher training classroom. Teachers and leaders are called to engage in personal transformative practices of emotional healing and self-realization, and also to risk a deeper authenticity and transparency in the classroom.

- *Participatory/action-based curriculum development and research.* At the graduate level teachers in training begin to become engaged in tasks such as curriculum development and research. Here (and in other contexts) progressive pedagogies are combined with progressive methodologies such as action research (Argyris, 1985; Feldman & Minstrell, 2000), user-participatory design (Barnathy, 1992), qualitative, interdisciplinary and mixed-method research (Bogdan & Biklen, 1982; Patton, 1980).

An Interview with Barbara Marx Hubbard

Russ Volckmann

Here is a case where there is virtually no need for an introduction. As she presents in this interview, Barbara Marx Hubbard's work has been apparent on the stage of cutting edge thinking and action for decades. Her book, ***Conscious Evolution****, published in 1998, is a call to action with a blueprint for the reconstruction of human reality. She calls on us all to actively engage in our own evolution, as well as the evolution of human societies and of the earth and its creatures. This call, so needed in 1998, is even more urgent today. She calls on us to stand alone and together in cocreating a world that supports all to thrive.*

She cofounded World Future Society, as well as other organizations. She is now producing a seven-part documentary series entitled "Humanity Ascending: A New Way through Together." This transformational series presents vital elements to awaken the codes for our own conscious evolution and offers direction, meaning, and a vision toward our birth as a new humanity.

An early book, ***The Power of Yin****, first published in 1977 is a fascinating dialogue with Hazel Henderson, Jean Houston and Barbara Marx Hubbard. Here, among other topics, they are already addressing the challenges of global environmental disaster. This continues to be one of her major concerns. Additional information about her and her work may be found at http://www.barbaramarxhubbard.com/content/.*

—Russ Volckmann

Russ: Barbara, I'm so excited to have the chance to talk with you. I'm familiar with your political work and other work from over the years. How do you view the current political climate in the United States?

Barbara: I'll start with my original political impulse. It came from the work I was doing on the idea of a conscious evolution and a positive future. It came out of the recognition that we're facing a crisis of an evolutionary order, and by looking at past crises in evolution, you can see that either the species becomes extent or it learns innovation, transformation and greater synergy.

I began to develop a concept I call "synergistic democracy." It is a democracy that facilitates each person in being freer to give their creative gift within the whole. It would be aiming at a co-creative society. It's not re-patterning existing democratic institutions like the Congress; it's more like what happened when Obama ran for president. He had 13 million people suddenly wanting to help and connect. There were new social networks developed.

Back in 1982-83, I was working with Buckminster Fuller and he told me about the viability test: the timing, the critical path, the utopia or oblivion, the fact that we have the resources and technology to make the system work. I came up with an idea that was

SOME RIGHTS RESERVED

really good, and it launched this paranormal political career—I say paranormal because it was so completely unlikely.

What I did was to run to be selected as the vice-presidential candidate on the Democratic ticket by whomever was nominated, and it was 1984—the year of the woman and the year of Big Brother. It was also the year when the public ear was attuned to women and a future orientation, which is barely happening again. I launched the "Campaign for a Positive Future" and I called my friends and said, "I'm running for vice-president. Would you give a party for me to help me raise funds?" That launched me on a campaign trail across the country where people gathered and I said, "We are at a crisis here of birth towards something new. The only way we will know what it is, is by having a new social function to map, track and connect what's working."

Russ: *What were the signs of the crisis in 1984?*

Barbara: When you look back, we still had the MAD (Mutually Assured Destruction) program. The Cold War had not ended. We were afraid of nuclear holocaust.

Russ: *Yes. I remember those days well.*

Barbara: Starting in the late sixties and early seventies with Silent Spring and the Club of Rome, Limits to Growth and other such works. We also became collectively aware for the very first time that we had problems with population, pollution, growth and that we were hitting a limit while our entire purpose was to grow. The whole capitalistic system was based on intimate growth…

Russ: *As it still is.*

Barbara: …and I went to a couple of Club of Rome meetings. I met Aurelio Peccei. But at the same time in the seventies, I became interested in the Space Program. I was amazed that at the very same year that we had a lunar landing, we had the first Earth Day—I think it was 1969 or 1970. I began to develop what I call an "Earth-Space Human Development Scenario." While we are limited on this Earth and we must conserve and preserve and limit population overgrowth and the form of self-consciousness that (inaudible) violence and competition … at the same time, while the solution is not massive growth in space, the fact is we were being born as a universal species. So embryonic, so new, and the reasons we were doing it were technological competition and militarism. Nonetheless, I gathered that we were to be both an Earth-based and universal species.

As I met the space scientists, I was completely amazed to learn of the metals and minerals on the moon, in the asteroids. I met Jerry O'Neill of Princeton who had the whole subject of the space habitats in L5 libration [L5 is the fifth Lagrangian Libration point. The libration points are sites in spaces where a spacecraft may be situated so as always to remain in the same position with respect to the Earth and the Moon.—Russ], where you would use non-terrestrial resources. These people were saying that while we have to conserve and preserve here, there is an almost unlimited new environment for humanity, but if we misuse the environment on this Earth as we are doing, there would be no chance we would go much further into space. But if we were to actually grow up—not only to stop growth on Earth but also to have an integrated self-social-scientific technological agenda—I saw that it could lead to an immeasurable future.

Out of this thinking, I came up with the idea that there should be a new function in the Office of the Vice-President, which was what I called a "Peace Room." It would be as sophisticated as a War Room and its purpose would be to scan for, map, connect and communicate what's working in America and the world. You know we have a system of finding all enemies and how to kill them. We also have a system of noticing all the problems and we have a huge system of keeping up the self-interest of the ones who have it against the ones who don't. But we actually do not have a practical system of noticing really successful innovations in health, education, energy systems and spiritual development. So I proposed that as my campaign for vice-president. What happened was such a paranormal miracle. I had no money, no media and no passes to the floor because the Democratic Party thought I was New Age.

Russ: *Well, you were.*

Barbara: I mean, "new" New. I walked into that convention—I think it was the wife of the Governor of Colorado who knew me, befriended me and got me into one caucus. It was like 5:30a.m. I gave a 30-second speech: "My name is Barbara Hubbard, I'm running for vice-president to map, track, and connect what's working in America." Boom. They signed up. In three days I had over 200 signatures and I was the other woman nominated.

Russ: *The other was Geraldine Ferraro.*

Barbara: Yes, and the Democratic Party was horrified. They pushed the whole convention up. The guard took me up to make my speech, which we had envisioned in church basements and in small groups. The guard said, "Now honey, they don't pay any attention to you. They never do. You're saying this for the universe." This was the guard saying this to me.

So I got up and I said, "There will be a Peace Room as sophisticated as a War Room in the American Presidency, in the Kremlin, in other capitals of the world, and within four years, we're going to see this new world emerging in our midst right now."

Just to jump ahead, there is now a movement afoot, once again, to revive the idea—but now we have the technology. We have the Internet. I was doing this as a vision. The idea is that we're right on the threshold of this new social function. What we need is one more level of coherence and purpose, of mapping and connecting what's working, and having a new news. I actually feel that what Obama is longing for in his heart is this. It's one thing to say, "The audacity of hope," and "Yes we can," but the government can't do this alone. It's impossible. The higher up you get, the more difficult the crisis is to deal with. When you get to the level of people sharing life purpose and creating new communities, new energies and new researches, you find it's a different world.

I want you to know that what happened in 1984 is resurfacing in my own work in the Foundation for Conscious Evolution. It turns out that Colorado again is a state where there are some of these small citizen-solutions councils. Some of my friends are trying to make this happen in Colorado. I'm going to the American Citizens' Summit that Joseph McCormick is putting on for reuniting America and I'm going to propose this repeatedly. It's not my organizational capacity, but I'm a spokesperson for it, so the effect of such a thing would be to enhance the connectivity of that which is creative. That would be leading towards a new relationship in Democracy where the people's connected creativity is the source of guiding the government rather than the other way around.

Russ: *I'm guessing that the media hasn't caught up with this yet.*

Barbara: Oh, no.

Russ: *What Obama is trying to do is to establish that kind of bi-directional energy between the White House and Washington politics and the rest of the citizenry by having us be involved and recommitted to this country in some fresh, new, exciting and generative way.*

Barbara: This is true. While I'm working with certain Internet people who are gifted and want to be able to set up such a service, I'm seeking to meet with Obama face-to-face. My intuition is it's in his heart's desire. It's not like trying to pass the Department of Peace through the U.S. Congress—this is an executive order—it has to be at the grassroots level. You have to have a receptive place in the presidency. It's just an idea.

Russ: *That brings us to the present. You talked about the individual, the social and the scientific. I think having a perspective on what you mean by each of those and how they relate to each other is really important.*

Barbara: I place everything in the evolutionary story. In order to think of the evolution of the self, I go back and think of *Homo erectus*, *Homo habilus*, *Homo Neanderthal*, *Homosapiens*, *Homosapien-sapiens*. It's not certain how these small jumps occur, but that jump to self-reflective consciousness was a big jump. They weren't aware that they were becoming self-reflective; it just happened. So that's 40-50k years ago. My sense is that 4k-5k years ago, the new jump started to occur in these avatars and spiritually gifted people.

There's a tendency in evolution towards greater consciousness, more complexity. We happen to be the generation that when the complexity hit a crisis, the possibility of self-destruction became obvious. What's happening to the self right now is an evolutionary awareness that we are an expression of the evolutionary process. We are evolution itself becoming conscious. The self-evolution for me is an awareness that my internal motivation is the impulse of evolution localized.

Russ: *One thing that has evolved for me in recent years is a greater clarity about connection and oneness and unity in the world and the universe. There's an increasing sense that all* *of our frameworks for understanding that and for trying to manifest that in our lives and in our world systems are just tools for affirming that, for understanding it, for communicating it. We organize religions around those tools. We organize intellectual traditions around them. Here I'm listening to you talk about evolution, and in a sense I'm reminded of David Loye's work on Darwin and his "Lost Theories of Love" and cooperation, etc. I'm wondering if you're saying something far beyond what I'm suggesting.*

Barbara: I think I'm saying something really significant—from self-effective consciousness about 40k years ago, there's been a continual growth of awareness in all different ways. I feel that the self-evolution is leading to a next stage of human evolution. It doesn't quite have a name—Teilhard de Chardin called it "ultra human," Aurobindo called it "Gnostic human." I call it "universal human." It's a human whose consciousness is evolutionary. I see it in myself. For one, I am aware of being internally connected to the eternal, which would be the more mystic awareness. I'm also aware of cosmo genesis—the whole evolutionary story—and I realize that in my atoms and cells that story exists. Everyone of us is a resume of the whole story of creation. Not only on the Earth's plane, but also as Brian Swimme points out, it took all those supernovas, evidently.

(laughter)

Russ: And I'm reminded of Eckhart Tolle who said that every time we take a breath, we are breathing a molecule of the air of Jesus Christ and Buddha.

Barbara: Brian talks about the big explosions in the galactic realm that created the carbon that was able to become matter and Earth, and it's a complexity and an awesome mystery, but I actually feel that in my self-evolution, I embody that. When I get really deep evolutionary consciousness, I can probably tune into molecular biology and nuclear physics and subatomic particles, because I am all that.

Russ: I know that you have an old friend in Don Beck. I first saw you in person at the World Future Conference in Washington, D.C. You were in the room and I said something innocuous and not very bright in the face of all the other energy that was in the room. I think of Don's work with Spiral Dynamics, and some of the other adult developmental psychology models in theory.

Barbara: It does. I know Don fairly well, and he gave me a turquoise stone—there's yellow in the second tier and turquoise is holistic, universal. Don doesn't focus on the evolution of the self quite like this—if the self is an expression of the one, if it is in its body-mind actually encoded with the whole story of creation, it also is motivated to create. I'm a creative self. We are creative selves, and we get called from our own unique creativity. When you were four years old, I don't think someone said, "I think this is what you should do," and then you studied to do it. None of us were told to do what we're doing. What I realize is that in the creativity of the individual, when it gets turned on in an evolutionary modality, it begins to recognize itself as part of the larger design. I don't think either of our vocations are independent professions; it feels that the closer you get to being your real vocation and saying "yes" to it, the closer you get to surrender into a process. When I really feel whole, I don't feel as though I'm doing this with my mental mind.

Russ: *I get that. It's an awesome kind of consciousness that you're referring to. I aspire to something like that in my own life, and I've had some glimpses of what it feels like to be in the flow that you're talking about.*

Barbara: Only from time to time. But I know what it's like. It's like a peak experience and you keep moving in that direction.

Russ: *Exactly. Or what Ken Wilber would call a "state" as opposed to a stage.*

Barbara: Absolutely.

Russ: *And this is why I brought up Don Beck and the stage theories. It's a recognition that the population of the U.S. as well as the rest of the world is characterized by considerable diversity in terms of these levels of development at a stage level. Wilber's work makes sense in terms of it being focused on people who are at least green and trying to move towards yellow and turquoise. He gives very little attention to the other levels other than questioning whether we've made them healthy in our developmental processes. Given the complexity that the spiral dynamics model represents in terms of the complexity of the population of the world, I'm hearing you say that you're aligned with Wilber around the idea of there being a critical mass to be reached in the evolution of consciousness that will help bring most of the world along with it.*

Barbara: I read somewhere that he said that if 10% of the population shifts, it doesn't take everyone to shift. It becomes more of a consensual reality, and you can see it happening now. It started during the great movements of the sixties and seventies, of civil rights, human rights, women—look at what happened with women and blacks! I mean, really! For all our criticisms of ourselves, that is truly amazing. All these other countries are stunned, including France. I don't think any of them have had a breakthrough comparable to this. I'm proud to be an American in this instant.

Russ: *We were talking about the self and its evolution, so I'd like to ask, what is implied around the social?*

Barbara: If you take the self-evolving as an evolutionary self becoming more conscious and more creative, I think that social evolution would be the facilitation of our creativity finding its vocation and joining with others to create. Everybody who is evolving in consciousness and who isn't in dire straits of hunger or war begins to have a real impulse to create—to express their own selves—not simply in a mystical way but in a way of self-expression, life's purpose, greater meaning than a meaningless job or relationship.

Maslow discovered that every joyful person had one thing in common: chosen work that they found intrinsically self-rewarding. I think the social becomes the co-creative society where more and more individuals find a way to express unique creativity. You don't do it alone, so you have to find others. You have to become co-creative rather than being the lone artist. What is becoming more obvious to me is that when you become co-creative through cyberspace and the proper use of networking, you'll find that your real passion to create is needed somewhere. You just need to find that matching needs and resources, and you'll begin to have a synergistic society.

In the seventies, I did 25 conferences called SynCons (for synergistic convergence) and we built wheel-shaped environments. Each sector was health, education, economics, and so on. We invited very opposing people to go into each sector of the wheel to state their goals, needs and resources, and then take down walls and look for common goals and match their needs with resources in the light of the system. It's in my books, The Hunger of Eve and Conscious Evolution. It's being revived. I'm having a renaissance at 80. I should be dead, but I seem to be coming back around!

So the SynCons were an early experiment in synergistic democracy. It was an embryonic stage of it. My partner John, who was COO for the Air Force, pioneered the New World's Evening News. That was where if everybody had an agreement, he called it "the news." I had welfare mothers, Yugoslavian ambassadors, space scientists, Jean Houston, Edgar Mitchell—I was a mad woman about wheels. I actually moved to Washington and John and I brought students from Southern Illinois University. We had about 10 wheel-builders, and we went around the country in a bus building wheels and holding conferences.

Russ: *Was it a Ken Kesey-type of bus?*

Barbara: It said, "The New World's Company." It was filled with 20-year-olds who were inspired.

(laughter)

Russ: *It sounds like a model that would be relevant today.*

Barbara: It is. John did "The New World's Evening News," and he designed it like a real newscast; someone reported all the murders and then they said, "Meanwhile, at Southern Illinois University, hippy so-and-so met with the Chief Economist of the United States, and they came to this conclusion." You'd see this completely unlikely couple. We had so many diverse people that the stereotypes disappeared and the news was co-creation. I actually think we hit it for a few times. Sometime in your life you will hit something that you can't fully sustain, but it was a signal of what could happen.

Russ: *I can imagine that would have a profound impact on people—both those who participated and those you met within communities. Was there any specific action that emerged from that work?*

Barbara: I think thousands of people were involved. When I lived in Washington, I eventually reconvened some of the people who helped me run it. It's intangible, but their entire lives have been affected. They're trying to apply it in their own work. Jerry Glenn, who organized this, is now head of the United Nations University where he has 30 tracking points around the world checking on what's breaking down and breaking through. Someone else is working for NASA; someone else is in PBS. We didn't have the finances to create an organization around it. We did it 25 times and finally my partner wore out, but I ran for vice-president. There are throwbacks in nature, and I think I've been an evolutionary throw-forward.

(laughter)

Nature throws things forward and most of them die. What happened to me is I got a hold of the evolutionary perspective. I applied it and demonstrated full form—in SynCons, in the vice-presidency, in the Soviet-American Citizens summit work I did as well as in my teaching. I thought it wouldn't amount to much, and in the last year as the crisis deepens, the work I did all those years ago is becoming useful. It's like I planted a garden: winter came, I thought everything died, and the matter of fact is it's spring.

Russ: That's amazing. I sense the validity of that. It's like when we take action in our lives and may be initially frustrated by a lack of obvious results, but then we see it emerge. It's like having children.

Barbara: It is. And there's a hidden process so I believe that the social is towards synergistic democracy. Social synergy is a new function like the Peace Room.

Russ: What is the role of the scientific/technological group?

Barbara: There is truly the quantum disruptive technology, if you talk about technology. Take robotics—think of Ray Kurzweil's work—and add biotechnology, nanotechnology, robotics, space development, zero-point energy research, and put that together with spiritual and social evolution. We become what I call a "universal species." Homo universalis. We have in the maturing knowisphere—if you want to use that language—we have the resources and technology to restore the planet, have clean energy, stop population overgrowth and so on. Those are immediate problems. We also have social innovations that can be cultivated. We can shift towards a more synergistic democracy … or die. I think that we should guide our science and technology to give us an earth-space life-ever-evolving scenario as a universal species.

Russ: What do you mean by "scenario?"

Barbara: Way back in the early eighties, I went to a big meeting of some international business that Orville Freeman was invited to address. These were the leading business executives of the world, a totally male-centered audience with people like Herman Kahn and Peter Drucker. Then there was me. The subject was doing business in a resource-short world and I said that the Earth was resource-short, but not the solar system. I read off the metals and minerals on the moon and the asteroids. I said they should create task forces to really look at the environmental crisis, the social/poverty crisis, and the new energy potential in the earth-space environment, and develop a long-range 30-year scenario. I knew they couldn’t do it short-term, but I said they were smart enough to do this. I was met with dead silence.

At the reception after the conference, Cy Ramo, who was president of a big space company, said, “Only one really important thing was said here today. It was by Barbara Hubbard.” All these huge executives really wanted to talk to me, but they didn’t know what to say. I said to Cy, “You have the resources of the entire world at your disposal. Why is it that you won’t create such a task force?” And he said, “You don’t understand how hard it is for us to survive, how competitive it is, what a short-range perspective we have. We’re much more fragile than we look.” That’s exemplified in recent times with the sudden collapse of the automobile industry. He was telling me then what I can see now. It’s much more fragile than it looks.

I believe we did our best. We got generals and members of Congress and thought leaders to agree that this scenario is the best thing we can do for national security, for dealing with social injustice and poverty. You can’t deal with it piecemeal. We talked to the Ambassador from Bangladesh. We did that at the SynCon. I see it’s reviving itself in a variety of ways. I’m just glad that I didn’t really feel so much of the failure that I gave up entirely.

Russ: *One of the evidences of that is your effort around vision. Can you tell us about that?*

Barbara: Patricia Gall and her husband Norman Kramer became really interested in how you get this message out. I’ve been a public speaker, I’ve been a writer, but it hadn’t hit a popular medium. They came up with the idea of doing a DVD series called “Humanity Ascending.” The first DVD is called, “Our Story: A New Way Through Together.” It’s an evolutionary story. Now we are completing visions of a universal humanity. I interviewed 10 wonderful people like Freeman Dyson and Jean Houston, Michael Dowd and space pioneer Rick Tumlinson, Don Beck and others on their view of the next stage of evolution. I wove their responses together as the story of the birth of Homo universalis. That will be out in a few months.

Colleagues of mine want to build a Peace Room—all of this now comes to another fruition level, but still way under the surface of mass media. My daughter is a biologist/environmentalist in Canada who is saving the wildlife from the fish farmers who are polluting the oceans and destroying the salmon and which destroys the surrounding ecology. She was so moved by Obama’s victory. She said, “Mom, I’m a biologist, and I put my ear to the ground. He broke the spell.” She’s long said that we don’t have much time, and that our environment can go extinct quickly. It’s not about saving salmon and whales—it’s life itself. When she said, “He broke the spell,” it’s the spell that it’s okay to be violent or corrupt or racially prejudiced or to be exponentially wealthier than others—like the Wall Street titans—while others are losing their jobs.

The spell has been broken. I feel that those of us who planted seeds can put our ears to the ground, and they're all growing. I'm beginning to feel this rising tide of life. It's more than just my consciousness; it's the billions of years of nature's evolution and I see a spiral with a core—I call it the Great Creating Process. It's not an external god, but it doesn't feel to me like an accidental universe. Between an external god and an accident based on error, I see the universal intelligence operative everywhere. It's a living universe as people say, and I feel that intelligence is breaking through now into our consciousness.

Russ: *How would people get in touch with what you're doing around vision and the DVD's?*

Barbara: Just go to www.EvolvingNow.com and you'll find my newsletter, "The Conversation of the Century." In the simplest way, they can tune into that, order "Our Story" and "Visions" and they can talk to me as well. I'm going to be doing a teleseminar series for people who are interested in this so that I can reach out further. Right now, I'm wanting a bigger outreach than before.

Russ: *So your involvement with the Evolutionary Leadership Group is another strategy or another approach that complements this?*

Barbara: Definitely. I was just invited to be a member of that. Several friends of mine, especially Barbara Fields who is the Director of AGNT—Association for Global New Thought—invited me to be a member. We only had a one-day meeting at La Costa, but it was amazing to have 30 people, all of whom are leaders, like Jean Houston and Joan Borysenko, Marianne Williamson and Bruce Lipton, Greg Brighton and others. Then the question was what to do. They determined it was a call to conscious evolution. James O'Dea wrote a draft of a declaration that is all over the Internet—it envelops conscious media, conscious business, conscious health—and we're having another meeting in July. People are being nominated for it. We are searching as others are for greater coherence, and I don't believe we've yet found in this movement—a positive change—discovered how to do social synergy at a really effective level. I don't think we know yet. What I mean is something like the Peace Room on the Internet and face-to-face as a coherent connectivity of what's emergent and working. I feel I know what it is in embryo, and I have a chance to work with some people on it, but it hasn't happened yet.

Russ: *Given that we're all operating in the soup of this global financial crisis and there are all these exciting, innovative, evolutionary and emergent activities going on as you've just mentioned, what do you think the rest of us should be doing? How do you see us as engaging with this effort and direction in a way that will contribute to the kinds of things you want to see happen?*

Barbara: I'm writing a book called, **The Joy of Supra-Sex** and here's my theory: the drive for self-preservation and self-reproduction—basic human drives—have expanded into the drive for self-expression and self-evolution. Sexual drive is expanding into creative drive. Literally as we have to have fewer children and live longer lives in the developed world, hundreds and hundreds of millions of people are trying to turn onto their greater creativity.

What I think everyone can do is the same thing you and I are doing. In my book, **The Joy of Supra-Sex**, I say that you first have to tune into the compass of joy inside you. What turns you on enough to attract you to start to create it?

I was told to go tell the story of the birth of humanity. Well that was an amazing vocation for a mother of five in Lakeville, CT. But I did. But when I was 29 or 30 and got this idea, do you think I was a likely person to do this? No. It was an impulse that attracted me. Also, I was depressed. Most people will get depressed if they don't find their deeper expression. We're meant to express ourselves more fully.

After the compass of joy, I talk about "vocational arousal." There's a certain arousal by talking to someone whose vocation is related to your own—you get excited and sometimes you want to get to know that person better. Then you go into how to join genius. When I'm talking to you, I feel you have a certain genius or certain creative talents and impulses. I have the same. We are in this small way joining genius right now.

The way you really get going to create in the world is you want more of the joining of genius. It feels good. Nature put pleasure as it did with sexuality. She put pleasure into supra-sexuality. It goes on to say that this would lead to a more co-creative society. I think the post-menopausal women over 50 are entering regeno-pause. Most people who find a life's purpose and stay alive will start to feel regenerated. Like me—I am totally amazed to be 79 years old and feeling this way. I don't know what word you use for men—it's not regeno-pause—but it's the evolutionary man and the evolutionary woman who get turned on. Then our creativity joining with each other creates a world. The old system can't do it.

I think if I were Obama I would be in hell. He's trying to prop up an old system long enough for the new to emerge. Whether that's right or not, I don't have the wisdom to judge, but I know that the new has to emerge and it's not that old system. I just went to something called "The Transition Town" about small groups and communities taking things into their own hands. They plant trees and take care of each other. They're all over the place.

I think the financial crisis is an absolute necessity. Probably what's happening is an attempt to keep it from complete collapse while the new systems—energy, currency, relocalization—take root. Nobody really says that clearly enough. They're talking about wanting to get back to "where we were," but I don't think we should or can. There's no way.

Russ: *What you're suggesting, then, is for all of us to be engaging consciously in our evolution, not just as individuals but connecting with others to create a more social generative effort around that. It's our opportunity to take advantage of the crisis to give rise to something more positive and meaningful for the world and the universe to have.*

Barbara: Really true. Tom Hartman told someone that at one of the inaugural balls, Obama had stood up there and said, "I am an empty vessel." That was symbolic of the fact that if we look to him to have all the answers, it won't work. People are just infantile if they think that someone else will have the full solution to all this. Actually, he's right. He knows we have to work together, but we don't yet have the social structure. What I'm working on with others is the social structure to empower co-creativity.

Russ: How wonderful. Is there anything else you wish I'd cover?

Barbara: Only what your own deeper passion and purpose is, just so I can catch hold of it from the point of view of being a co-creator with you.

Russ: The way I think about what I'm doing is trying to create a field that is fed by many streams and tributaries, but fosters the emergence of more coherent ways of engaging all the challenges we face in the world. The reason why the subject of leadership fascinates me so much is that I think that's one of the areas of transformation that we are going through that is quite significant. I think it fits with your comments about Obama—our models and our ways of thinking about leadership historically have been heroic leadership models. There's still a role for heroic action, and I think some of the things you brought up today demonstrate that. But I like to distinguish between leader as role and leadership as a system that includes the self, the social, structures, processes, technologies and cultures.

It's been fascinating to watch our evolution in the past several years since I've started this. I love seeing how these ideas are starting to pop up in lots of different places. What we're evolving into is a way of thinking about leadership that is far more in keeping with the kinds of social dynamics that you've been describing—we're not looking to others, we're not looking to Obama, we're not looking to the governor or the priest or the leader of our choice to bring about change. We're looking at ourselves and at our own relationships to support the emergence of the kinds of changes that are meaningful for us.

Barbara: Well we're definitely co-creating, and the more convergent we are, the better. I did a whole seminar on evolutionary leadership in terms of how it happened to me. I went underneath the particular things I did as to what the motivation was to take a housewife from Lakeville with five children into this life, and how to uncover the actual experience of becoming an evolutionary leader when I didn't even have a name for it. Anyway, that's for another interview.

Russ: I look forward to that one, Barbara.

Barbara: Well Russ I'm glad to have met you and gotten to know you. Thank you for your work and for the interview.

Russ: Thank you, Barbara.

So I was Playing With Brushes on the Back of My Hand

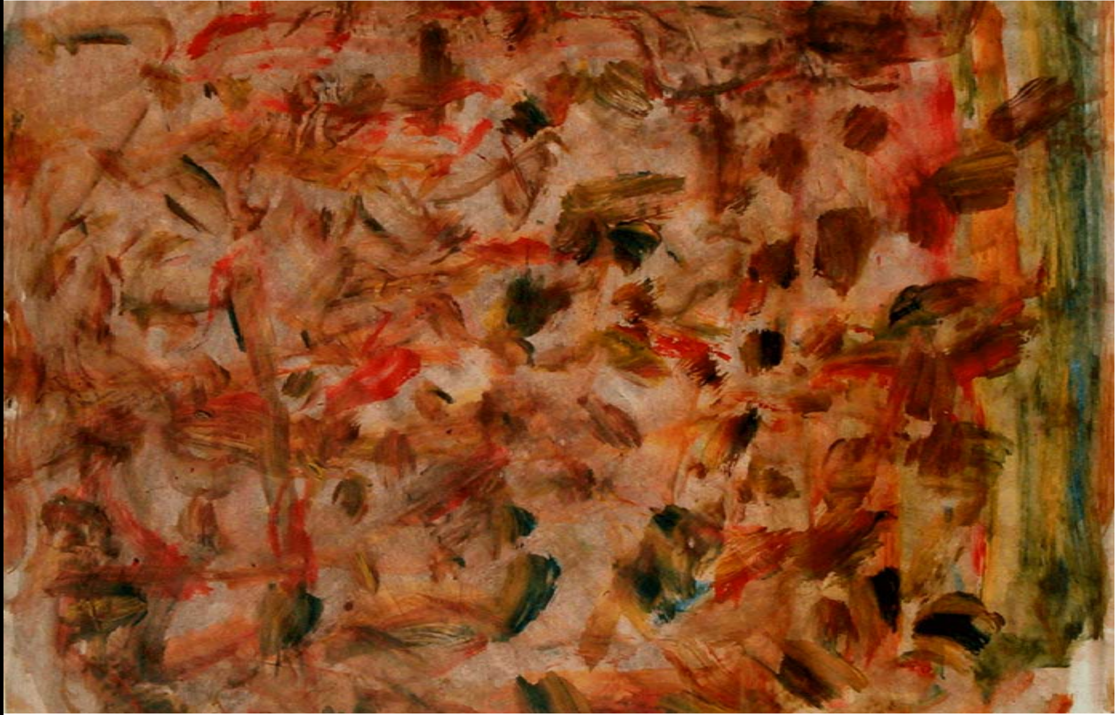
A Contemporaneous Co-creation of Amy Leung and Andrew Campbell to Three Contributions to Integral Review

A L *…So I was playing with the brushes on the back of my hand...As you know, the space 'in-between' is co-created. Our fertile ground is fed by our openness to fully receive and give to each other. In this richness, we are able to be as we are. This is what could be called 'Art'.*

A L Hi, I would like to meet Thursday or Friday. Thank you.

A C *Good*. So would I.

A L Gorgeous! Looking at your painting, I am transported to Japan- cherry blossom, koi and kimono.



Cherry blossom, Koi, Kimono, Andrew Campbell, Acrylic on paper, April 2009

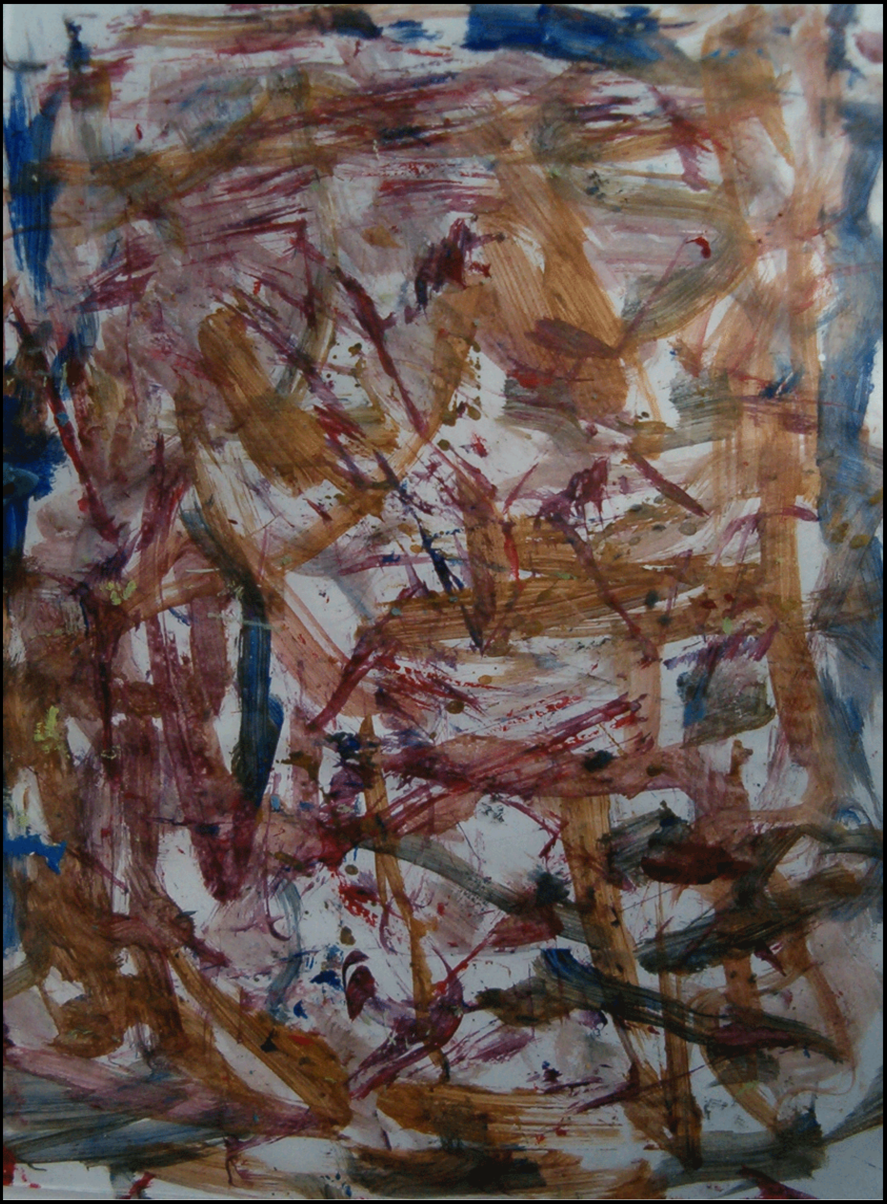
A C "Cherry blossom, koi, kimono and Amy - four corners of this soft world"

A L Your words touch me deeply- With tenderness.

Russ: One thing that has evolved for me in recent years is a greater clarity about connection and oneness and unity in the world and the universe. There's an increasing sense that all of our frameworks for understanding that and for trying to manifest that in our lives and in our world systems are just tools for affirming that, for understanding it, for communicating it. For one, I am aware of being internally connected to the eternal, which would be the more mystic awareness. Everyone of us is a resume of the whole story of creation. (laughter)

SOME RIGHTS RESERVED

A C And I made this, this afternoon
A L I feel really spoilt- different moods, different shades...how blissful to receive this after a day shuttling between North London and South East London...an oasis.



King's Chair, Andrew Campbell, Acrylic on paper, April 2009

Barbara: Every joyful person had one thing in common: chosen work that they found intrinsically self-rewarding. I think the social becomes the co-creative society where more and more individuals find a way to express unique creativity. You don’t do it alone, so you have to find others. You have to become co-creative rather than being the lone artist. What is becoming more obvious to me is that when you become co-creative through cyberspace and the proper use of networking, you’ll find that your real passion to create is needed somewhere. You just need to find that matching needs and resources, and you’ll begin to have a synergistic society.

Barbara: Nature throws things forward and most of them die. . . . It’s like I planted a garden: winter came, I thought everything died, and the matter of fact is it’s spring.

Day Dancing, Andrew Campbell, Acrylic on paper, April 2009

Are you teachers?
    Waves caress
    Pebbles sigh
Pitter patter of rain
Dancing on black umbrella
Bespoked
    Red mac
    Pink crocs
This could be New England- Have you
been?
    TIME
    TIME
Gulls swoop
Time to move
A lift
A twist
    The crunch of pebbles
    Home

[Amy Leung]

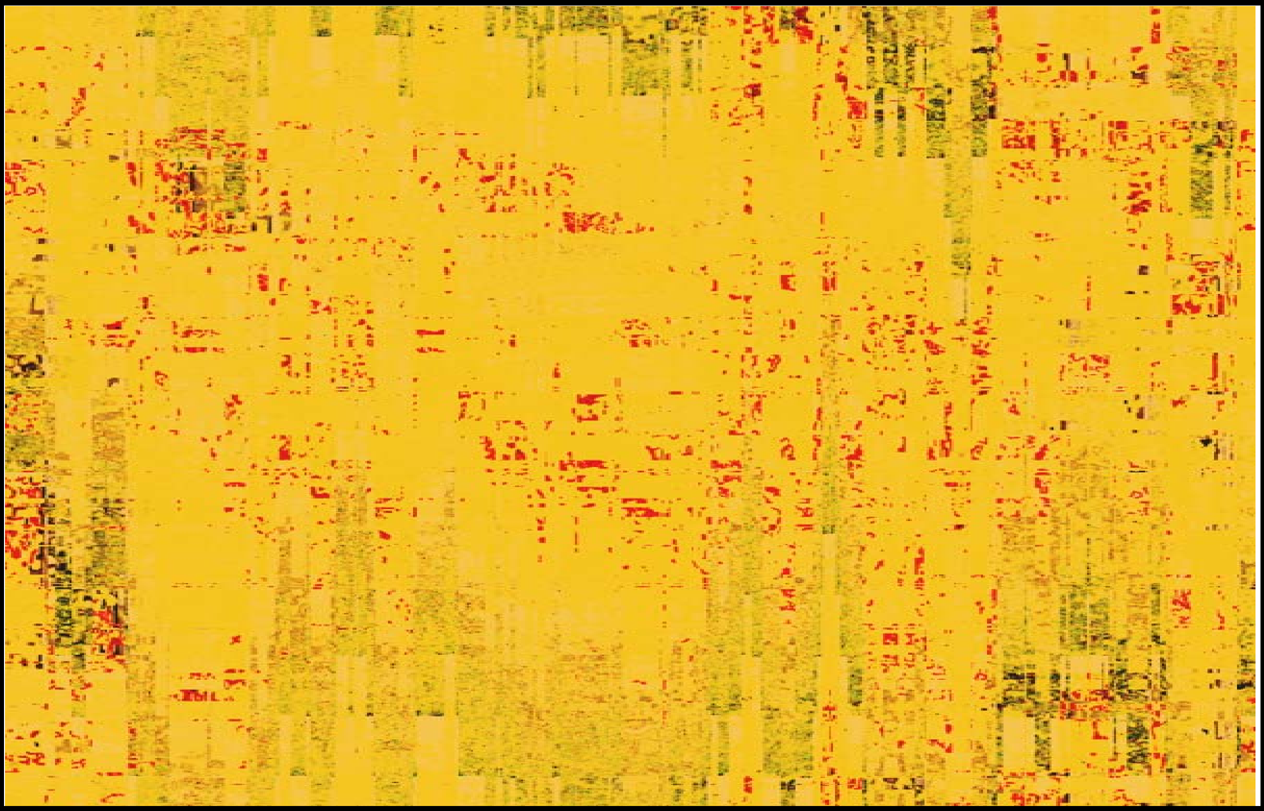
The Ultimate Tone: The Sound Not Heard

In the perennial philosophy of Nature, this gravitational descending glissando of all that exists symbolizes the stark imperative of Anaximander's fragment: Each must pay restitution for its existence according to the dictates of Time. The revels over, the seed of Dionysos inseminates the womb of Gaia/Earth, first holder of the Delphic seat. The course of *Phoebus* Apollo above her in summer’s heat is to herald Nature’s autumnal bounty. For nature philosophy, though born of tragic awareness, is a philosophy of Emersonian hope, of transcendence, a transcendence the Sage of Concord mystically sensed in creation’s infinite symmetries --and in the ineffable Mystery of Nature emanating from deep within the sacred stones of Delphi.



Tempus/Tempo in Yellow, Andrew Campbell from an original by Amy Leung,
Watercolours on paper fielded in electricity, May 2009

Yet, Hans Kayser's wrote *Akroasis* with "the note not heard" in the harmony of the spheres (H. Kayser, *The Theory of World Harmonies*, Boston 1970), the thirteenth overtonal note commencing the new octave, the spirit mystically attains the apex of the sacred *Tetractys*. And in the *Trieteric* rite, the winnowed seed of infant Dionysos falls to the womb of Gaia/Earth, there mystically, to strike the fire of rebirth at the altar of Hestia, "Hearth of the Universe," in the center of the theater of Dionysos. Then, in the mystery-beyond-knowing, the spirit of the initiate gains release from the wheel of Being, vaulting, transcendently — beyond the Pole Star — beyond the Boundless *apeiron*, "beyond beyond" — in the mystery of *Paranada*, Sk.: "the soundless sound beyond creation."

Shakespearean Transcendence

When sun, at noon, had aligned along the meridian, Dionysos was in the center of his sanctuary and Hestia was at her Central Fire of Creation altar in the center of the god of ecstatic release's theater orchestra. The day had been quartered, as the year had been quartered in the Delphic temple, Dionysos intimately rejoined his mortal mother, Semele, for the winter quarter within the *omphalos*.

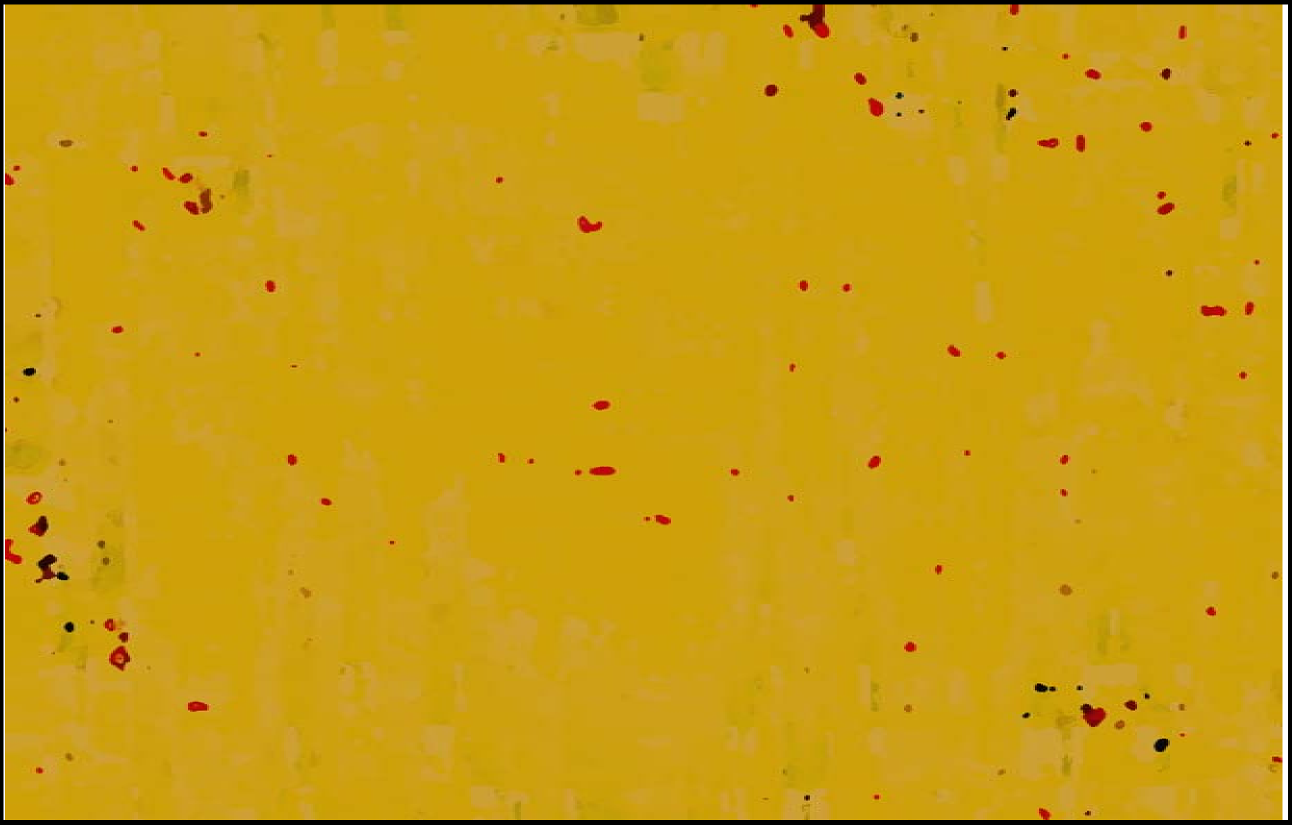
Then, at high noon, beneath Apollo's solar glare, as in the midnight dark of the *Trieteric* rite, as the meridian passed through the center of Dionysos' Sanctuary (signaling the fall of Fate's decree on the tragic hero) and the still point in the celestial whirl obscured by the solar disc's blinding glare, and the Boundless *apeiron* rang with the "sound of silence" — Harmony of the Spheres — at this culminatory moment did Oedipus' vanish in a blaze of light.

The inspired vision of Edouard Schure pointed the way on this journey into the Unknown when he proclaimed, "Above all, one must trust intuition"? And had his trust not been well placed, for had it not revealed to him that "Pythagoras, while at Delphi for a year, had, per Meletzis and Papadakis, "... revolutionized the art of prophecy"?

I felt — there's no explaining how — Delphi's "sound-of-silence" extended somehow beyond our "knowing," infusing our very Being, as had Sophocles' profound tragedy of transcendence. Then, the answer came to me: the answer was to be discovered in that other towering tragic masterwork: *Hamlet*.

Given Hamlet's complex nature, it is hard to believe that, "rest" is to be taken as an allusion to the sleep of the just, to death's repose, as in Horatio's all-too-conventional resort to a heavenly hereafter. Rather, it would seem to suggest a line from *Love's Labour's Lost* that "we fools of nature... with thoughts beyond the reaches of our souls" (I, iv, 51) are here in an encounter with the spirit's destiny, we are engaged in a mystic transport to, and beyond, the "undiscover'd country"— and to its ineffable silence.

Sages, searching in their hearts, with wisdom
Found the bond between being and non-being.



Tempus/Tempo in Yellow II, Andrew Campbell from an original by Amy Leung,
Watercolours on paper fielded in electricity, May 2009

"The most beautiful thing we can experience is the mysterious."
(Albert Einstein < http://www.quotationspage.com/quote/1388.html>)

Divided, into East and West, the world stands in desperate need of the transcendent vision of Dirghatamas, who 'saw' far, far, beyond the light, beyond the darkness of *Creation Veda* X. 129:

Then was neither Being nor Non-being....
darkness wrapt in darkness....
The breathless breathed breathlessly....
Sages searching in their hearts, with wisdom,
Found the bond between Being and Non-Being.

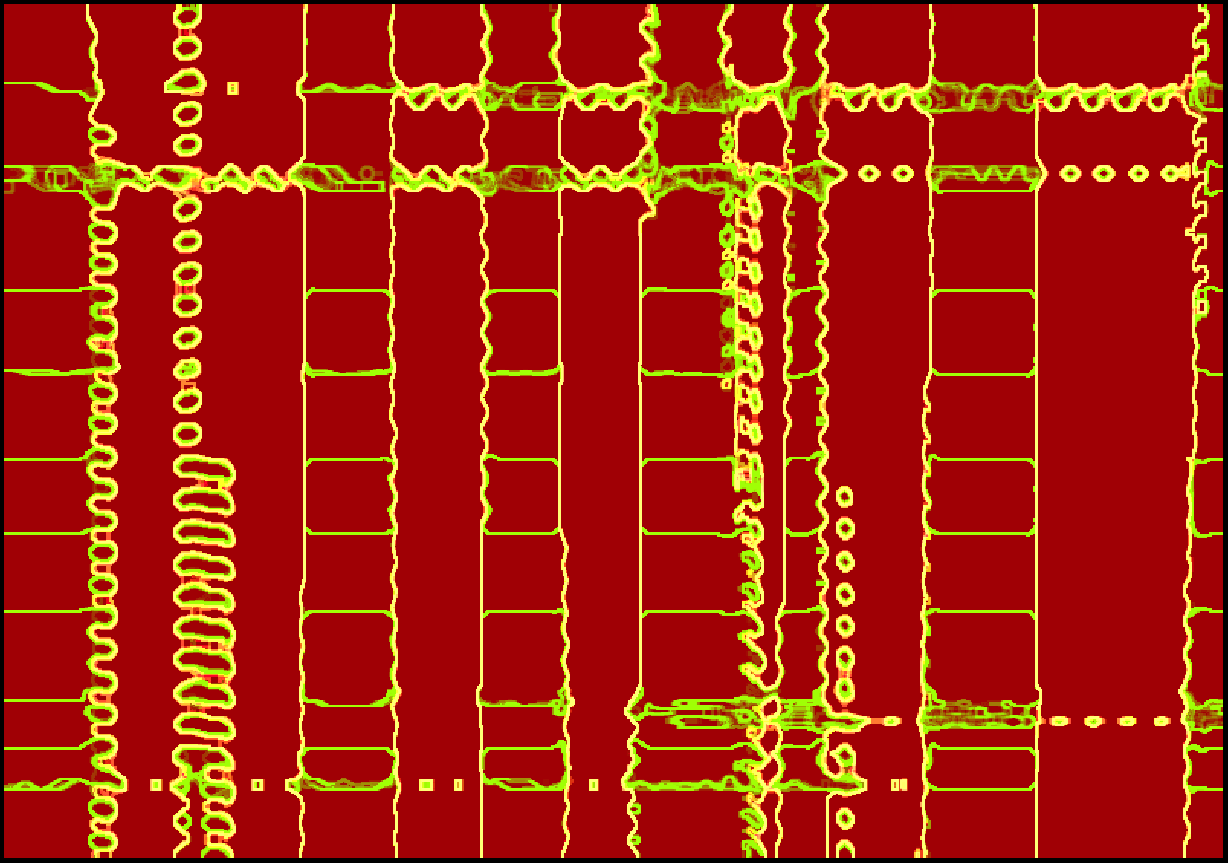
Establishing Second-Person Forms of Contemplative Education: An Inquiry into Four Conceptions of Intersubjectivity

Buber's Conception of the Interhuman

A twentieth century religious existential philosopher, Martin Buber has been a prominent voice in advocating the ideals of sacred consciousness, interpersonal relationship and dialogue in community. Buber's philosophical contribution involves framing human existence as contingent upon interpersonal modes of consciousness, interaction and being through which one engages with other humans, nature, the inanimate world and the sacred. Best known for his distinctions of I-Thou and I-It relationships (1965; 1966; 1984), Buber argues that human life consists of a movement between meeting and mismeeting in these realms, with the I-thou representing a sacred form of relationship (which is central to interhuman relations) and the I-It a more common secular variety (Buber, 1965). In Buber's (1984) monological I-It relationship, others are regarded like an "object" in a world that largely consists of people to be interacted with in order to serve our desires and ends. Buber (1984) elevates the personhood, needs and interests of the other as "subject" in the dialogical I-Thou mode of relationship, basing it on a responsiveness to and confirmation of the other, the other's deeper humanity and the existing present-ness of the situation. Wood (1999) elaborates on the I-Thou relation:

For Buber, I-Thou relations are unique, unpredictable, immediate, and involve the whole of oneself 'bound up in reciprocity' with the other. I-It relations are linked to the universal, are predictable, mediated by past experience, and involve only a part of oneself which stands at a distance from the object. I-It relations are third-person relations, so that for 'It' one could substitute also 'He' or 'She' of 'They.' (p. 84)



Golden Sky III, Andrew Campbell from an original watercolour of clouds by Amy Leung, May 2009

As a context that is “generated by the immediate presence that binds together a conscious “self” with a conscious “other.”” (Kramer, 2003, p.78), the interhuman offers a key dormant dimension of intersubjective experience that learners discover through I-Thou meeting:

When two individuals "happen" to each other, there is an essential remainder that reaches out beyond the special sphere of each-the "sphere of the between." In an essential relation the barriers of individual being are breached and "the other becomes present, not merely in the imagination or feeling, but in the depths of one's substance, so that one experiences the mystery of the other being in the mystery of one's own." (Buber, 1965, p. 170) The interhuman involves relating to others as partners in a living intersubjective event, bringing about a context where I-Thou relationship may emerge (Buber, 1966).

Buber’s characterization of the interhuman signals describes a subtle way of the being with others from the condition of presence, presence-based realm where former barriers or boundaries between self and other soften, offering an existential referent in that it enables the self and the other to become more immediate, tangible and real.

Buber’s work offers a helpful insight into the transformative potential of addressing one another through deeper presence in the intersubjective encounter, which can give rise to an ontological shift in the context of our inquiry and learning within educational settings. By implementing contemplative second-person approaches that are not only aware of the relational and sacred implications of I-thou encounters with our students, but also committed to enacting the interhuman as a primary concern, I believe Buber’s contributions to intersubjectivity can shed important light on one of the necessary preconditions for collective contemplative methods informed by the deeper ontological realms of the interhuman sphere of the between.

Nhat Hanh’s Interbeing

Nhat Hanh (2000) builds upon this classic Buddhist insight and goes a step further by emphasizing how the realization of interbeing gives rise to an increased sense of interconnectedness, bringing about a more inclusive and deepened ethic of responsibility for others.

The practice of interbeing foregrounds the dynamic interrelated elements of the learningclass process with one’s students, which cultivates compassion and an education of heart (Dalai Lama, 1999). Whether through a contemplative reconstruction of our student’s points of view or a willingness to feel our student’s distress concerning a particular injustice and resulting suffering on a particular issue, interbeing disrupts our traditional sense of agency and western self-sufficient ideals of individuality.

Upon closer inspection, interbeing offers the possibilities of what Wilber describes as “agency-in-communion” (Rothberg et al., 1998, p. 216). That is, an agency that is no longer being motivated by a traditional idealized masculine stance of autonomy that avoids, suppresses or denies communion. From the perspective of interbeing, our individual strength and source of empowerment are fueled by our connection(s) with others within greater fields of interrelatedness, further helping us see through the false Cartesian dualism of personal autonomy versus relationship. Bai (1999) elaborates: “The self dynamically flows into, out of, and with the other, creatively assuming a complex, polymorphous sense of agency. It is not the simple sense of agency wherein the subject (the self) does something to its object (the other)” (p. 4).

By attending phenomenologically to the distinctive intersubjective space(s) we co-inhabit with our students, the educator learns (with practice) to see through the dualistic tendencies of his or her own consciousness—particularly in terms of how this reinforces different forms of separateness and fragmentation in group contexts of classroom learning. By forging a more distributed basis of connection with our students, the class subject and the processes of contemplative inquiry, seeing with the eyes of interbeing can help facilitate a shift into a deeper second-person intersubjective experience. As these elements coalesce, occasions for engaging with multiple contexts of self and otherness invariably arise. By modeling and encouraging a less rigid identification with our conventional identities, interbeing also offers a more distributed context of inter-relationality, which in turn establishes a broader ground and intersubjective context out of which we can lead the class inquiry. This helps relieve everyone of the individualistic if not narcissistic habit of blocking the intersubjective view by being in the middle of a conversation or steering classroom discourse with one’s private agenda.

In addition to the applications of Interbeing discussed above, educators may wish to impart a taste of the experience by introducing a guided visualization informed by Nhat Hanh’s (1998) writings:

> If you are a poet, you will see clearly that there is a cloud floating in this sheet of paper. Without a cloud, there will be no rain; without rain, the trees cannot grow; and without trees, we cannot make paper. The cloud is essential for the paper to exist. If the cloud is not here, the sheet of paper cannot be here either. So we can say that the cloud and the paper inter-are. “Interbeing” is a word that is not in the dictionary yet, but if we combine the prefix “inter-” with the verb “to be,” we have a new verb, inter-be. Without a cloud and the sheet of paper inter-are. If we look into this sheet of paper even more deeply, we can see the sunshine in it. If the sunshine is not there, the forest cannot grow. In fact, nothing can grow. Even we cannot grow without sunshine. And so, we know that the sunshine is also in this sheet of paper. The paper and the sunshine inter-are. And if we continue to look, we can see the logger who cut the tree and brought it to the mill to be transformed into paper. And we see the wheat. We know the logger cannot exist without his daily bread, and therefore the wheat that became his bread is also in this sheet of paper. And the logger’s father and mother are in it too. When we look in this way, we see that without all of these things, this sheet of paper cannot exist. Looking even more deeply, we can see we are in it too. This is not difficult to see, because when we look at a sheet of paper, the sheet of paper is part of our perception. Your mind is in here and mine is also. So we can say that everything is in here with this sheet of paper. You cannot point out one thing that is not here-time, space, the earth, the rain, the minerals in the soil, the sunshine, the cloud, the river, the heat. Everything co-exists with this sheet of paper. That is why I think the word inter-be should be in the dictionary. “To be” is to inter-be. You cannot just be by yourself alone. You have to inter-be with every other thing. This sheet of paper is, because everything else is. (p. 3)

Golden Sky I, Andrew Campbell from an original watercolour of sky and clouds by Amy Leung, May 2009

Top left, Amy Leung co-facilitating a retreat for young leaders at a Buddhist temple, Toronto. Top centre, Andrew Campbell teaching at Chateau La Tour Apollinaire. Top right, Swan attending Amy and Andrew during a riverside meeting to discuss this submission. Bottom left, detail of 'King's Chair', by Andrew Campbell. Integral Ecology:
Uniting Multiple Perspectives on the Natural World

by Sean Esbjorn-Hargens and Michael Zimmerman
Integral Books, Boston and London, 2009

Review by Jan Inglis

I was asked by the editors of the *Integral Review* to review the book *Integral Ecology*. While reading it I alternately felt impressed, stimulated, irritated, curious, skeptical, intrigued, and appreciative. Through this review, I will offer an overview of the structure of the book and elaborate on some of the book's main themes, offering some commentary, inquiries, and alternative views.

I will begin with a description of the book's intended audience and position my background as a reviewer in reference to those criteria. The authors say they are writing the book "as an advanced introduction to Integral Theory in general and Integral Ecology in particular" (p. 13**),** hoping this is beneficial for those new to integral applications and studies of ecology and to those who are long-term scholar-practitioners of integrative efforts. Since the mid 1980s, I was engaged in the environmental field, offering workshops on bioregionalism, conservation, despair and empowerment, sustainability indicators, and climate change. I was involved in two international projects focusing on community sustainability using participatory action research. In my search for a way to find meaning and respond to the growing challenges, I embraced many of the ecological perspectives and methods named in this book, from blaming modernity to eco feminism, deep ecology, and creation spirituality.

It was through the searching to understand how we had created these life-threatening issues and why we did not seem to be able to respond to meet their complexities that motivated me to study adult development. I studied the early works of Ken Wilber, Clare Graves (in the form of Spiral Dynamics) Robert Kegan, Bill Torbert, and Michael Commons. I am currently less familiar with the work of two other significant contributors, Kurt Fischer and Elliot Jaques but hope to learn more of their work. After 20 years of work as a practitioner and ten as a teacher of Integrative Body Psychotherapy for individuals, I have moved towards using integrative processes to assist us culturally to develop more reflective, transformational, and metasystematic responses to complex issues. This has taken the form of developmentally designed public deliberation or what I call *3D Democracy for Civic Interaction and Action* based on public issue analysis, behavioral science, and adult developmental theory. I have published several articles on the subject of climate change from an integral and developmental perspective. (Inglis, 2007, 2008a, 2008b)

SOME RIGHTS RESERVED

Structure of the Book

I will describe the structure and basic content of the book indicating a few general comments with further critique offered in a later section. The writing of this book was motivated from the authors seeing a need for a textbook on integral ecology. Through the book's ambitious 800 pages, the authors attempt to cover philosophical, theoretical, and pragmatic territory. It has an extensive bibliography offering 1,750 sources from ecological and environmental literature, in-depth footnoting, and definitions of 200 perspectives on the natural world. There is a forward by Marc Bekoff, who indicates an appreciation for the authors' inclusion of animal subjectivity in their analysis of science and ecology. The introduction offers a background of the authors' motivations and their definitions for *integral* and *ecology*.

Part One introduces Ken Wilber's Integral Theory, which forms the theoretical basis for Integral Ecology. It offers chapters on the objective and interobjective perspectives they see commonly taken in environmental endeavors and the subjective and intersubjective perspectives that they see as usually lacking and therefore problematic. They differentiate between NATURE (the Kosmos, or Great Nest of Being, championed by "post rational romantics") Nature (studied by natural and some social science: the Great Web of Life, championed by "rational materialists") and nature (the empirical-sensory world: the Great Biosphere championed by the "pre-rational environmentalists"). They have described at length the confusion that can occur when developmental progressions are not considered and can lead to the romanticism about going back to a simpler pre-rational pre modern state attempting to find solutions to our current ecological issues. To further clarify the principles of Integral Ecology, they offer an in-depth critique of deep ecology and a response to Stan Rowe's critique of Ken Wilber's view of humanity's place in nature. There is a chapter on quadrants and holons, and two chapters on how they view development as occurring with a focus on natural and social science, and individual and community domains.

Part Two describes the Who, What, and Why of ecological phenomena. It uses the Wilber AQAL (all quadrants, all levels) map for "understanding the relationships between *who* is perceiving nature (epistemology), *how* the perceiver uses different methods, techniques, and practices to disclose nature (methodology), and *what* is being perceived (ontology)" (p. 158). Based on a footnote, this also includes the influences of *when* and *where*. Further sub categorization occurs by describing how these fit into four terrains, twelve niches, eight eco-selves, and eight modes of ecological inquiry. The latter presents a platform for "integral research."

Part Three briefly covers application, exploring our differing views of being "one with nature," and different assumptions of what constitutes an ecological "crisis." It promotes the need for "transformative" practices or "integral nature mysticism" through using our interaction with and inhabitation of the natural world to support deeper interior awareness. They offer some guidelines for application based on the Who, What, How categories and several project summaries.

Part Four presents three case studies including community development in el Salvador by Gail Hochachka, natural resource conflicts in Hawai'i by Brain Tissot, and environmental activism in

Canada’s Great Bear Rainforest by Darcy Riddell. The case studies were not developed as research projects but offer anecdotal descriptions of long-term engagement with communities dealing with complex ecological issues. They model the AQAL method for observing and discriminating the multiple aspects that make up this complexity. This includes descriptions of the impact that detailed observations and reflections as well as having a language to communicate them can have on people and projects. The book concludes with the authors promoting the strengths and advantages of Integral Ecology, reviewing the basic principles such as: including interiority, not being reductionistic, and emphasizing spirit as both Immanent and transcendent. They also indicate their intention to be responsive to feedback and criticism by revising and rearranging their work in an attempt to continue searching for better ways to define and communicate the Integral Ecology approach “in service of a better tomorrow for all beings of this amazing blue-green planet” (p. 488).

The book is well organized, and offers an impressively bountiful smorgasbord of resources and considerations, woven together with ecological subject matter. The intent to be thorough and useful to the challenging issues facing our and other species is deeply expressed. Their attempt to provide resources for both those new to Integral Theory and ecology, as well as the advanced student, creates a challenge that they have attenuated by including both narrative as well as more in-depth footnotes.

Although they offered definitions to indicate how they were using various terms, I found that these were often vague and inconsistent and when attempting to track significant and repetitively used words such as *perceptions*, *cognitive*, or *interior* I got lost in the shifting interpretations. I would predict that for those primarily interested in the field of ecology, the amount of discourse on definitions and categorizations specifically based on the AQAL model might be off-putting without the added motivation of prior interest in AQAL specifically or in the field of adult development in general. If so, they could possibly skip to the end of the book, to see if there was resonance with the applications described in the case studies, then return to the who, how, and what analyses with more context. Despite its statement that Integral Ecology “places an equal emphasis on theory and praxis” (p. 339), I found the book to be vast in conceptualization and weak in application.

Specific Critiques

I will now write in more depth about several key areas: the focus on interiority, the Wilber model of Integral theory (with which I am assuming the reader has familiarity), research, and application.

The Importance Placed on Interiority

The first chapter, and a major theme of the book, is on the “return of interiority” which the authors see as having been reduced to the exteriors when the “moderns threw out the spiritual baby with the premodern bathwater, and with it went interior perspectives” (p. 21). They believe most ecologists exclude the importance of interiors and therefore Integral Ecology is especially focused on creating a return to the appreciation of the interiors as they believe therein lies our motivation to treat the natural world in healthier ways. Therefore they prescribe personal practices to support the individual development of the interior although it is unclear how they see this development becoming integrated and transferred to systemic responses to ecological issues. They seem to assume an overly simplified causal connection: that if we feel connected with nature then we would not knowingly damage it. However, I see many people feeling very connected to nature but having a difficulty in sorting out which of the matrix of competing choices we face everyday may create the least harm now or in the future.

The authors define interiority as the “capacity for opening a perspective or clearing” (p. 41). They refer to this capacity as not exclusive to humans but more readily articulated by humans, allowing for us to be self-reflexive, to alter how we think and act, and question “origin, constitution, and purpose” (p. 41). The vague definition of interiority, along with the attempt to span all species with the term, leads to a blurring of the tremendous significance of the developmental step of self-reflexivity. The capacity to see that one has perspectives, as do others, and that these impact how we and others act, allows us to move from formal thought to postformal thought. That move enables us to see and respond to complex relations and thus act systemically. Feelings, values, and behaviors of individuals and the collective are all occurring simultaneously and reciprocally. Repetitive focus on the “interior” as the driver of development artificially suggests a separation between these aspects in ways that they are not.

Mark Edwards spent much time responding to his own question regarding the exaggerated focus on the interior aspects, asking why Wilber consigns “the Right Hand exteriors to the flatland world of shallowness while portraying the Left Hand interiors as the bastion of qualitative depth” (2003, n.p.). He cited much research that indicated how development occurs in a broader context and concluded “This incapacity to deal adequately with social theories that take their lead from the exteriors seriously limits Integral theory's potential to develop a comprehensive and integrated social theory of its own” (2003, n.p.). Thus, in such cases, what one attempts to describe as differences in quadrants is being confused with differences in complexity. Behavioral development theory (e.g., Piaget’s work in general; Commons, Trudeau, Stein, Richards, & Krause, 1998) establishes that the ability of a human to respond to single events and things (“exteriors”) develops before the more complex ability of noticing and attending to interconnected and underlying dynamics such as the feelings and values associated with events and things. Therefore focusing on the “return of interiority” as the main solution for ecological issues does not take into account this developmental hierarchy and does not indicate the methodology for how it supports the transition towards the more complex nature of systems thinking. That transition is a necessity for adequate responses to the complexity of ecological issues.

Does Integral = Wilber?

“Does Integral = Wilber?” was the topic of a panel discussion at the first Integral Theory conference held at JKF University in California in August 2008. This was not a question I assumed I would focus on when agreeing to do this book review and preferred not to be distracted from conveying kudos I would like to bestow on the authors for their energy and commitment in taking on this mammoth writing. Also it seems that blogs and forums over the years have already been investing much time in this debate and many are weary of it. However, since most of this book is spent describing and promoting the Wilber model underlying the concept of Integral Ecology, it is difficult to do a review of the book without it including a response to the Wilber model.

When AQAL was introduced it offered a ‘heads up” examination of things entangled in a heap. Like a freeze frame in a movie, AQAL has given us a very useful way of stopping the complexity of movement and interactions and observing, analyzing and creating a precise checklist of what is involved: what is present, and what is missing. However, this is not the movie. Even if more and more freeze frames are considered, they do not equate to the complex dynamic interactions that make the movie of life. As Wilber has said several times, AQAL offers a map not the territory. Nevertheless, the static AQAL map is often used to make assumptions about how to work with the dynamic territory. This is partly why I perceive that Integral Ecology has such difficulty moving from observation to application, as it does not have a process to engage and advance the complex dynamic interactions of humans dealing with ecological issues. I will expand on this point in the section on application, below.

We need to get clear on the question of one or more integral theories and how to distinguish them. A footnote states:

> Let us be clear: Integral Theory does not present itself as the only possible integral theory. It is, however, one of the few contenders at a genuinely meta-paradigmatic level. We are aware that at least some of our truth claims will eventually be proven false, but we have done our best to investigate them. (p. 552)

This differentiation, responsiveness to input, and commitment to integrity are welcome to see. Since other views on what constitutes integral theory do exist, it would be helpful to move beyond just the use of capital letters to differentiate this model, but refer to it as Wilber’s Integral Theory. As there are so many people who have been impacted by the work of Ken Wilber, this would give credit where credit is due as well as consider the natural defenses that occur whenever people with different views and experiences are disregarded. Otherwise, those who feel they are working integrally but not within this model may feel the need to seek out another term.

The tendency toward and destructiveness of territoriality between schools of thought is well named “…scholars, practitioners, and activists build fences between approaches when we are in even more need to build bridges. The result is a fragmented field of approaches that are pitted against one another” (p. 158). There is a gap between the sensitivity named above and this absolutist statement in the next paragraph: “Integral Ecology provides a framework capable of organizing and integrating the myriad perspectives and their multiple fields into a complex, multidimensional, postdiscplinary approach that defines and provides solutions for environmental problems. The AQAL approach is the only organizing framework currently available that can honor this radical multiplicity” (p. 158). This, along with another sweeping statement, “Yet until now, people have not had access to a robust theoretical model that organizes and integrates various disciplines and methods, and generates comprehensive solutions” (p. 5), does little to build bridges or open up generative discourse with peers. Such peers may not fully embrace the AQAL model and may see other approaches as offering robust theory, capable of organizing and integrating multiple perspectives. If these statements were preceded with a qualification such as “Based on our research, we believe…” it would feel less like planting a flag and marking territory and more like owning a viewpoint and being open to its pros and cons being considered amongst other approaches. I truly feel the authors’ intent includes one of generosity, not competition, and is humbly articulated in several places in the book, but may sit in unresolved tension with another intent: that is,, that of promoting their model. Possibly these statements were meant to provide assurance for those already embracing the AQAL model that they were indeed on a really good bus that could provide hope and direction amidst the overwhelming ecological issues, but this promotion became overzealous in calling it the best and only bus.

Text Book or Promotion

Further promotion of the Wilber model is found in the promises of what ‘interior” development might create for individuals and the planet. The altitude (previously referred to as level of development) called turquoise is described: “Having experienced this [Divinity] firsthand, turquoise-integral can also help generate conditions in which violence does not occur, in which species do not become extinct, and in which terrestrial life forms can prosper in a way that both sustains span and encourages depth” (p. 140). Another statement of lofty ambition arrived as a small enclosure with my copy of the Integral Ecology book, from Integral Life.[1]

> An Integral life is total freedom to be who you already are. A life where peace and passion come alive. Providing a place for everything in your life. Better relationships, sex, career and health. More effectiveness, more purpose. Less confusion, less fear. In order to be. And to become. Welcome to Integral Life. Where growth enthusiasts make sense of everything.

Wow, this is a very different experience than how peers and I describe our experiences as we move along our developmental progressions: seeing, and therefore needing to sort out, more and more complex material that arises within us, between us and amongst our groups and organizations. There are periods of vulnerability, uncertainty, and isolation that push the deeper questions and deeper integration. The above statements can create an illusion that higher development means easier.

An Integral Model, that supports an Integral Life, through an Integral Life Practice (body, mind, shadow, and spirit modules) to manifest in the application of Integral Ecology could certainly provide a draw for those wanting a structure to help them make sense of the challenges we face, with a community of others, motivated to grow, learn and make a difference in the world. These are hefty promises especially for a “text book” and it seems necessary for the sake of integrity then to back them up with sound interdisciplinary research. Otherwise, they are left in the realm of promotion and wishful thinking.

---

[1] This quote was taken from a 3.5 “x 5” enclosure accompanying the book from Integral Life www.integralLife.com

What Qualifies as Research, and How Do We Use It?

The authors offer a chapter to describe their chosen form of research, Integral research, which is based on Wilber's Integral Methodological Pluralism "a collection of practices and injunctions guided by intuitions that 'everyone is partially right!' and that everyone brings forth and discloses a different and partial facet of reality" (p. 42). Integral research has been formed in part to respond to the long-term divide between qualitative and quantitative research. The authors, citing the mixed methods work of Johnson and Onwuegbuzie, Creswell, and Brewer and Hunter, see the Integral research bridging this divide as well as matching the four quadrants and eight modes of inquiry. The description of what Integral research entails is very expansive but the definitions do not reflect a level of methodological sophistication that characterizes many sciences. Much of the popularity of Wilber's Integral Model has been ascribed to the fact that it was accessible compared to other material couched in academic and scientific terms. Should the academic and research community seek methods of making their information less sophisticated, more accessible and application oriented? Can research be accessible and still meet the rigor for which it is intended? Can making it accessible be other than oversimplifying it and dumbing it down to meet the layperson's level of experience and degree of commitment? Do we want accessibility at the price of veracity? A new Integral Research Center has been developed presumably with the purpose of dealing with such questions and supporting the field of Integral Ecology. It is reassuring to see that it will be working with two experienced researchers: Theo Dawson of Developmental Testing Service and Susanne Cook-Greuter of Cook-Greuter and Associates. As the authors say, "Reading, studying, and even memorizing Integral Theory's maps and diagrams will not in and of themselves generate integral thinking or integral awareness, actions, or solutions. Such awareness requires considerable effort and developmental achievement…" (p. 62). Yet they also state, "We can deduce the level of consciousness at which people operate by observing their behavior and what sorts of phenomena they encounter" (p. 121). I am hoping that the "considerable effort" can replace this more vague "deducing" and be defined and supported by the quality of research planned for the Integral Research Center, as it seems vague at this point.

Approaches to Research in Adult Development

How easily research can be misapplied, especially in the field of development, is noted in chapter 7, on page 229. A graph, called Important Lines of Development, relates vertical lines and theorists under these headings: Cognitive (Piaget/Aurobindo), Self identity (Loevinger/Cook-Greuter), Environmental Identity, and Sphere of Moral Concern. The "cognitive line" does not identify that it is also using terms associated with the research of Commons & Richards (metasystematic, paradigmatic, and cross paradigmatic), as well as those by Wilber (vision logic). It also misplaces the sequence of the Commons & Richards stages.[2]

---

[2] With Integral Ecology indicating that it is thorough in its inclusion of relevant material, I was surprised to see only a brief mention in a footnote of the Model of Hierarchical Complexity (MHC). MHC, developed by Commons et al. is a quantitative behavioral developmental theory for examining the non-linear activity of constructing the universal patterns of evolution, development, and stage transitions (Commons, 2008). Through the studies of Dawson-Tunik (2006) the consistency with which it accounts for stages of development, when compared with other instruments designed to score development in specific domains, has been validated. I appreciate the MHC model as it offers a value-free way of

This error and the implications of it were identified in an article published in *Integral Review* (Ross, 2008a). The article was highlighted in the speech regarding the necessity of accurate use of developmental research by Susanne Cook-Greuter at the Integral Theory conference in August of 2008. Raising this again, I hope will not be seen as desire to be nit picky about a single error, as we can all make errors, but to act as a reminder, to us all including myself, of what we are playing with when using scientifically obtained developmental data and making inferences from it regarding human behavior. To aid in that intention I quote the call for accountability voiced by Zachary Stein (2008), a senior analyst for the Developmental Testing Service and a doctoral student in philosophy and cognitive development at Harvard School of Education. In an article called *Myth Busting & Metric Making: Refashioning the Discourse about Development in the Integral Community* he says:

> Rich descriptions and explanations of how development unfolds are produced and consumed (especially in the Integral Community) with very little attention to the methods, models, and metrics that make them possible. We love the knowledge, but could care less about how it was made. So the myth of the given rears its head.
>
> What if were we to jettison this myth and adopt a properly post-metaphysical approach to developmental assessment and theory? Things would be different. For example, the issues surrounding the making and refining of developmental metrics (those things which disclose the data) would take primacy over the presentation of various stage models and narratives. We would turn away from the stories describing development and towards the making of the metrics that justify these stories. This kind of intra-disciplinary self-reflection represents a level of methodological sophistication that characterizes many sciences and is especially important for those aiming to generate useable knowledge
>
> The FDA is good example of a quality control agency that mediates between researchers and the lifeworld by bringing attention to the methods and claims being made in the laboratory. If we were to thoroughly dislodge the myth of the given in developmental studies and choose to adopt an epistemologically responsible approach to building and using developmental metrics we could learn from agencies like the FDA. Not any theory and its concomitant interventions should reach the market. We need to be concerned first about what justifies the approach and then about how exciting or revolutionary it is. Right now we are mainly concerned with the latter. How many peer-reviewed empirical studies are published confirming the efficacy and validly of Spiral Dynamics; not stories about its use or antidotes [sic] of success, but studies on the validity of it basic constructs and measures? Answer: next to none. But how popular is this approach? Answer: It is one of the most popular approaches out there and its language is ubiquitous. But this is not just about Spiral Dynamics, comparable criticisms could be leveled at other approaches. In general, we need to refashion the discourse about which developmental approaches are best. (Stein, 2008, n.p.)

---

understanding and measuring the hierarchical complexity of tasks and skills that are involved in effectively responding to the ecological issues that challenge us. A full description of the Model of Hierarchical Complexity and its application is available in *World Futures: The Journal of General Evolution* 2008. Special issue: Postformal Thought and Hierarchical Complexity. Volume 64.

Stein's article co-authored with Katie Heikkinen in this current issue of *Integral Review* further develops this call with explicit discussion of how to recognize and apply more rigor.

Application: Is there Proof in the Pudding?

Based on the many promises made in the book of creating comprehensive solutions to ecological issues, readers may assume they will find the proof in the pudding. Even though a cook book may start with a large section on "know your ingredients," offering lots of information and categories of different oils, vegetable, and flours, one expects that there will follow details of how to combine these ingredients and transform them into satisfying and substantive meals. With the Integral Ecology book, offering 340 pages of different categories and subcategories of almost every theory and theorist in the large field of ecology, plus reporting that Integral Ecology offered the only way of coordinating and integrating such different perspectives, one was led to expect a methodology for effective engagement and application. Disappointingly, there are only eleven pages that include a few bulleted points regarding guidelines, and a brief example of application to climate change and to recycling.

The guidelines, organized under the Who, What, and How format, indicate the need to be inclusive of many perspectives of people, methods, and research, to clarify confusions and seek common ground. These guidelines offer little more than the well-intended but simplistically designed techniques that have been used for decades in community development and public engagement. Working with ecological issues requires engaging the public who are both impacted and impacting these issues and who also hold valid and totally different perceptions as to what makes a good response. Knowing that there are different valid perspectives is an important step, repetitively covered in this book. However, indicating how to actively work in order to transform these differences — the necessary next developmental step for creating systemic responses — is disturbingly absent. For example, although the authors indicated that **"**Arguably the most pressing issue facing humanity is the predicted occurrence of global climate change**"** (p. 341), the only aspect they chose to mention under the heading *An Integral Approach to Climate Change* is a for-and-against debate occurring in the U.S. as to the validity of the existence of climate change. This plus the 24 questions used to explore the topic is included to model, yet again, that many perspectives are valid and need respect. This reliance on the "everyone is partially right" approach seems to indicate that the Integral Ecology bus has driven us right into the green swamp of relativism. It is an inadequate response to meet "the most pressing crisis facing humanity" which needs, as do all complex issues, further metasystematically designed process steps to move us out of such polarity and inertia into considered decisions leading to comprehensive actions.

After seeing the importance placed throughout the book on being sensitive to and including as many perspectives as possible, I began to wonder what really was their definition of "integral." I went back to the beginning of the book where they quoted Wilber as saying "the word *integral* means comprehensive, inclusive, non marginalizing, embracing. Integral approaches to any field attempt to be exactly that: to include as many perspectives, styles, and methodologies as possible within a coherent view of the topic" (p. 5). So that is what the book has done: included, labeled, organized into many categories a rich list of ingredients i.e., a *horizontal* complexity.

Integral approaches to me are not just naming and appreciating multiple perspectives, styles, and methodologies but actively working with their differences, that is, engaging the *vertical* complexity in such a manner so the dissonance creates integration at a higher, more complex level. This active engagement to support the vertical complexity requires a developmentally designed process. Although the authors briefly indicated that practitioners of Integral Ecology would require a "meta-discourse" they spent no time in exploring what that might be. Possibly they are not aware of a whole new field that combines the fields of civic engagement, specifically that of deliberative democracy, with adult development and political development. The need for this field, and for a pedagogical approach that supports its application, has been articulated by Chilton (2003), Inglis (2007a), Rosenberg (2002, 2004), Ross (2007, 2008b-c, in press), and Ross and Commons (2008). It holds promise of providing the alchemical processes for integrally *activating and elevating* such ingredients as AQAL is integrally *observing and categorizing*.

Ecological issues require public interactions and actions to resolve them. Therefore we need processes to support these interactions, where the public can weigh out the costs and consequences of holding different perspectives, and taking different actions that support what they collectively consider to be most valuable. This fundamental basic practice is called public deliberation and can be designed to meet the developmental requirements for responding to complex issues. Further expansion of this assertion would require a separate article. Information on the research and methodology of such a process usable for addressing ecological issues, or any complex issues, is available at http://global-arina.org/TIP.html, which includes a bibliography. Had it been available for the communities described in the three case studies, it would be interesting to discover if this process might have complemented and potentially accelerated the work of addressing multiple needs and multiple perspectives discussed in the cases.

Conclusion

Integral Ecology is a big book that I believe is twisting and turning, trying to grow up and out into the world through a confining, static model. As a resource book, it is very valuable because it includes descriptions and references to many authors and theories, and I will keep it on my bookshelf for that purpose. As a textbook, I would hope it would be offered with a range of other theoretical and well-researched material for students to consider without bias. For those already embracing the Wilber Integral Theory I assume it will be very helpful to furthering their understanding of that model and how observations and inquiry regarding the various perspectives of ecology can be seen through that lens. As for application, it offers a broad method for observing and including multiple perspectives but lacks a process for us to actively engage with each other and with the critical ecological issues of our time in order to build capacities for systemic social change.

Immunity to Change: A Report From the Field

Jonathan Reams

Introduction

Many of us have long been fans of Robert Kegan's work, as well as his collaboration with Lisa Lahey. My first introduction was in a doctoral class where we were assigned his (1994) *In Over Our Heads*. I recall that as we discussed it, there was a consensus in our class that we were somewhat annoyed, as it was the only book in our course work that we could not skim! There was a richness to the descriptions and stories that required detailed attention in order to begin to grasp the depth of meaning being conveyed. While for many of my classmates the world of adult constructivist development did not "stick" so to speak, for myself it grew to take a central place in my work as an educator and consultant.

However, as with anything of real substance, mastering the understanding of it takes time. As the distinctions Kegan presented in his work began to take root in my perception of the underlying structure of consciousness in individuals, I found myself wanting to find ways to apply them in the work I was doing. I must say that my early attempts were typically crude, teaching through an intellectual presentation of concepts. My goal was to create activities that were informed by a developmental understanding, however the circumstances of my life did not provide much in the way of opportunities to do this at that time.

More recently, having a position that allows for curriculum development around leadership, I finally got around to reading Kegan and Lahey's (2001) *How the Way We Talk Can Change the Way We Work. Seven Languages for Transformation.* I was enthused to see how they applied the core principle of making what we are subject to an object of reflection in a simple and straightforward manner, and set out to test how well their process worked in a class of mature students studying leadership development.

I then ordered their latest work, (2009) *Immunity to Change. How To Overcome It and Unlock the Potential in Yourself and Your Organization* and read through it in anticipation of being able to apply what further insights it might have in a two day consulting assignment. While the concepts of subject object relations and adult development are rich in their descriptive power, the question still remained for me: how can they be successfully applied in practice?

In this article I will present a description of my experience starting to answer this question. First, however, I present an overview of *Immunity to Change*. My goal here is not to review the book in a traditional sense, but to provide a quick summary of its core points as context for those not yet familiar with the book or Kegan and Lahey's, or Kegan's earlier work. From there I will describe my experience of testing out the work in the two contexts mentioned.

SOME RIGHTS RESERVED

Overview of the Book

Introduction

In opening this book, Kegan and Lahey situate their work in the context of the past 25 years of work in the field of organizational change. Specifically, they comment on one of the critiques of the literature and work around learning organizations, which is that they did not take adult development into account. They note that when Senge's (1990) *The Fifth Discipline. The Art & Practice of the Learning Organization* came out, brain scientists still held the belief, assumption, or to them fact that there were no mental or brain changes after adolescence. While neuroscience has begun to revise its understanding (see books like Begley's (2007) *Train Your Mind Change Your Brain*, about the research on neuroplasticity) of the possibilities for adult development, the implications of that finding for organizational learning and leadership have yet to be realized. It is this task that Kegan and Lahey take on in this book. They frame this by making a distinction between leadership *development* (implying developmental change) and leadership *learning* or *training*.

Part One. Uncovering A Hidden Dynamic in the Challenge of Change

Chapter 1

In chapter one, *Reconceiving the Challenge of Change*, they begin by noting that leaders who view capacity as a fixed resource will fall behind those who work to enable the growth of capacity in their organization. They then introduce the understanding and model of adult development that has now had over a generation to mature, moving from the density and complexity of Kegan's earlier works, (1982) *The Evolving Self* and (1994) *In Over Our Heads*, to a succinct one-chapter summary that gets the essential points across in a simple and accessible manner. In addition, they link adult development with effectiveness in business, citing dissertation research by Keith Eigel (1998) that shows a clear correlation between stage of cognitive development and leadership effectiveness.

They then examine the gap between the level of cognitive capacity present in society and the demands being made by leadership literature such as that of Chris Argyris, showing that Argyris has long been proposing a model of leadership wherein the leader is implicitly being asked to have a self transforming (or fifth order) mind. They cite their own (using the SOI/Subject Object Interview) and other studies (using the WUSCT/Washington University Sentence Completion Test) to show the percentages of leaders at the various stages of development, identifying the gap between the mental demands on leadership today and the capacity generally available.

Finally, they draw on the distinction by Ronald Heifetz (1994) between technical and adaptive challenges to show that most of the challenges leaders face today are adaptive in that they ask us to adapt our level or stage of mental complexity rather than simply apply technical solutions. The misapplication of technical solutions to adaptive problems is seen as a major source of dysfunction.

Chapter 2

In *Uncovering the Immunity to Change*, Kegan and Lahey present and illustrate their notion of the immunity to change. The first step is to learn how to formulate challenges as adaptive, and they use detailed examples from the "laboratory" of their work with leaders over the past few years. These examples show the development of their four column map, work first outlined in their previous book (2001) on *Seven Languages for Transformation*. Through showing contrasting maps of the immunities to change, they also show how the underlying structure of immunity is the same even if the particular challenge or issue is different.

They then make three premises about overcoming this kind of immunity. First, that overcoming it does not mean needing to get rid of all our anxiety management systems. Second, that anxiety is produced not merely from the onset of change, but from feeling defenseless in the face of it. Third, that the immunity systems we have developed can actually be changed. They link this to how it shows up in the stages of development, and then identify the concept of optimal conflict as the condition that best supports the kind of development being sought. Optimal conflict is made up of persistent experience of frustration, that allows us to feel the limits of our current way of knowing in some area of life we care enough about and that we have sufficient support to avoid being overwhelmed by the conflict.

They close the chapter by looking at three dimensions of the immunity to change: change prevention systems, feeling systems, and knowing systems. This leads them into the fourth column or the "big assumptions" that are seen to hold people. It is the revealing of these big assumptions that allows for the complete picture to emerge, integrating the three dimensions of the immunity to change.

Chapter 3

"We Never had a Language for It" or *Engaging the Emotional Life of the Organization* is the title of chapter 3 and here Kegan and Lahey share, again through examples, how they learned from their clients the need to put the right issue in the first column. This is called the "one big thing" that each person identifies (with the help of feedback from others). This is designed to include people's private lives as well. The need to link personal and organizational development becomes clear through further illustrations. They also describe the need to have a champion at the top, or to have the leader truly committed to acting on this work.

The authors then reveal how their focus on individual development has been supplemented by learning from clients who have a much better understanding of how to look at things systemically and organizationally. This enabled their work to not only address the adaptive growth of individual's meaning making systems, but also of the emotional life of the organization.

Part 2. Overcoming the Immunity to Change in Organizations, Individuals, and Teams

Chapter 4

Chapter 4, *Overcoming the Groupwide Immunity to Change* takes a collective approach to the immunity to change work. In line with the concepts of learning organizations, this chapter presents three brief and three more detailed examples of how groups of various sizes and from various sectors of society were able to make use of the four column process to create organizational learning. Some of these groups began with individual immunity maps, while others applied the process on a longer term scale by making use of surveys to get input into commitments, and pilot projects to test out the big assumptions that emerge.

Kegan and Lahey make an important distinction that the third column work, which can prove the most challenging, "simultaneously provides a *cognitive* awareness of a change prevention system at work, and the *emotionally* unsettling insight that the true barrier to change come from within the system" (p 118, emphasis in the original). This is similar to what Scharmer (2007) describes as third stage or reflective dialogue. In both descriptions, the critical insight that allows shifts to happen come when those involved in reflecting on the challenges faced realize they are actually sustaining the very system they wish to change.

Chapter 5

David Doesn't Delegate goes into depth of the story of one leader's work of using the immunity to change process to actually change behaviors. This is accomplished through taking his initial big assumption and seeing an even bigger underlying core value and assumption about it, and then trying out actions that tested the assumption. The use of some further tools to support this process are introduced, and the successful outcomes are detailed. An additional benefit of this chapter is that the example used also illustrates some of the core issues facing leaders as they face challenges of building capacity in teams they are responsible for leading.

Beyond this rich and instructive illustration, the authors show how the question of changes of mind and or of behavior is not a chicken or egg which comes first question, but a dialectic interplay that takes the explicit challenge being faced and uses working on it to facilitate development. In this way the immunity process is used along with our work and life challenges to help us see the picture of *what has been authoring us*. This central proposition of moving from being held by assumptions to self authoring a new relationship to them is well served by the illustration in this chapter.

Chapter 6

In *Cathy Can't Contain Herself*, we hear the story of how Cathy worked through her immunity map. Rather than a step by step process, her story shows that sometimes a very intense experience can test our big assumptions to the core all at once. The chapter provides a second example of the many forms this work can take, and at the same time the core pattern that runs through the immunity work.

Chapter 7

In *The Case of Nascent Pharmaceuticals*, Kegan and Lahey bring together the power of doing the individual immunity work within a group context. They go into depth on the processes they used with the team that Cathy was a part of. Three workshops over six months, individual coaching, and the use of various survey and assessment instruments enabled the team to make significant progress on their goals. These goals, trust and communication, are good illustrations of common issues teams everywhere often face.

In moving from individual to group work, the additional complexity of the dynamics involved becomes clear. The tendency to avoid bringing personal issues to the group setting because of tendencies to pathologize individual problems is nicely dealt with through the use of framing and processes that enable each team member to see the strengths that are one end of a continuum related to those weaknesses. The coordination of the various tools used to support the process, the timing of the work and the importance of the leader setting the tone and acting as an example are all well illustrated.

Part Three. Over to You: Diagnosing and Overcoming Immunities in Yourself and Your Organization

Chapter 8

Unlocking Potential describes three necessary ingredients to successfully take on the work of unlocking your immunity to change: a vital energy source of motivation for change, both cognitive and emotional aspects working together and action or behavioral work. The gut level, or vital energy is required to help us go beyond feeling that something is important, to feeling it is absolutely necessary to address the adaptive changes revealed.

Engaging the thinking and feeling together is required as no amount of thinking about the work will get it done, as also no amount of emotional effort by itself will either. It is a combination of “thinking about our feelings and feeling our way into new thinking” (p. 216) simultaneously that moves us along in the adaptive or developmental work. Finally, action must be taken, the hand put to the wheel so to speak to generate the experiences and experiments that can test our assumptions and move the insights into reality. The power of doing something that reveals the assumptive nature of our deeply held beliefs is what can enable us to take a perspective on them rather than being held by them.

Chapter 9

Diagnosing Your Own Immunity to Change covers the territory of the Seven Languages book, at least the first four chapters. It provides the benefit of adding clear criteria by which you can evaluate if your column entries are sufficient to the task of helping create a robust x-ray map of your immune system. Kegan and Lahey describe how they learned over time how to help the people for whom the original four column exercise was only interesting and not deeply moving produce a better map.

They begin by stressing the importance of generating the right first column commitment. If it is not something sufficiently important, and more to the point, something that aims at a personal adaptive change, it will uncover an immunity system that does not really matter to us, wasting the potential the exercise has. In the second column, the need to describe specific, concrete behaviors is stressed so that later on you will be able to better see why you do these things. The third column is generated through the simple question of what is at risk if I do the opposite of these behaviors? These "worry box" fears are then reframed to make the competing commitments of the third column. Again, criteria are provided to enable you to evaluate if you are getting sufficient depth in your entries here.

The fourth column big assumptions are generated next through a simple process of imagining what must be held as "true" for the third column competing commitments to make sense. The power of this is that it reveals territory that we have previously been subject to, and that our immune systems have acted as guardians of. They protect us from venturing into what is assumed as unsafe territory. The simplicity, power, and elegance of this process comes through quite clearly in this one chapter summary of four chapters in their previous book. But now what to do with the insights gained?

Chapter 10

Overcoming Your Immunity to Change is where Kegan and Lahey take this work beyond where the *Seven Languages* book went. They take the immunity map, and frame it very succinctly "You can see the very good reason *why* you are holding yourself back: You want to save your life as you know it" (p. 253). The developmental pattern of taking what has us or we are subject to and making it an object of reflection involves reaching deep into our self image or identity. The brilliance of this work shows through here as the authors lay out a careful, step by step process for allowing you to experience the limits of this identity, and begin the process of constructing a new one.

The work of testing big assumptions is set out in clear stages. First is designing a test. Here they make an important distinction between an event focused approach and a process or learning focused one. Our tendency to take immediate action to solve the problems identified in column two leads to thinking that if we can simply do something that goes against our competing commitments or big assumptions, we will have overcome them. Kegan and Lahey point out that the point of the test is to learn something about our big assumption – to see if and to what degree it might be true, false, or more nuanced than we imagined. They again provide helpful criteria for guiding the design of the test, and examples of how it might look.

The second step is running the test you have designed. Here it is important to make detailed notes on what actually happened, both about how you felt during the test and how others responded or acted. They emphasize directly observable data, and warn against allowing interpretation to sneak in. The third stage is the actual interpreting of your test, and here again examples illustrate the points made and a guide sheet keeps us on track.

Once these steps are completed, they show how to consolidate the learning by identifying how you get hooked into activating the big assumption and entire immunity system. In addition, you learn how to identify new practices you develop that help release you from the grip of the immunity system. All of these are shown to be repeatable, and how they can help evolve and even develop new immunity maps over time.

Chapter 11

Surfacing Your Collective Immunity to Change applies the same four column process to a group. They strongly advise not going straight for this approach, but to run individuals through the individual process first to get a real feel for it. They again lay out criteria and steps for groups running this process together, and as one might imagine, doing it as a collective adds a certain degree of complexity that then requires an appropriate amount of time to go through.

Conclusion

Growing Your Own, or *How to Lead so People Develop*, pulls together the core themes of the book and makes it clear that what will enable organizations of any kind to succeed in the 21st century is taking a developmental stance and being able to master the immunities to change. The main body of the chapter is an examination of seven crucial attributes of this work. Summarized, they say that mental growth continues after adolescence, that there is a distinction between technical and adaptive learning, that people have an intrinsic motivation to grow, that these kind of mindset changes take time, and that they involve both thinking and feeling, that reflection and action are interdependent and enable each other, and that there needs to be sufficient safety and support for facing the risks in this depth of change of mindset.

Report From the Field

Reading over this brief summary of the book, you might want to say “sounds great, sign me up,” or alternatively find yourself more skeptical and saying “sounds too good to be true,” or have a degree of both responses mixed together. My tendency is to begin with enthusiasm and then find the reality of trying to apply things a bit of a humbling experience. Since all the theoretical understanding in the world does not make up for a lack of experience, I felt it critical to try applying the techniques laid out in this work.

Phase One

My first opportunity for application came in the winter of 2009 when teaching a new course on leadership development and organizational transformation in a masters in organizational leadership program. I had designed the course around a combination of individual development along with how to apply that work in service of organizational transformation. Students were mid level professionals from a variety of sectors, coming from various parts of Norway.

They received a leadership assessment[1] to give them a sense of where they were at in terms of key leadership dimensions. Following their debrief and some overnight homework related to their feedback, I led them through the four column exercise as described in the *Seven Languages* book. There were some challenges keeping them on track at times, and getting them to understand what was being asked of them. Some of this could be attributed to language issues, as not all the students were totally fluent in English, and some of it undoubtedly was attributable to the limitations of my first attempt at giving the instructions.

---

[1] I used The Leadership Circle 360 feedback instrument – http://www.theleadershipcircle.com/ as it incorporates Kegan’s distinction between the institutional or socialized mind and the self authoring mind.

In *Immunity to Change*, Kegan and Lahey describe how after doing the four column work for a while they noticed that around 30-40% of people did not get to a really profound and useful big assumption. I would say that this was reflected in the work with this group of students as well. For some it produced insights like “I never realized that all this time I was being driven by the opposite of my self-image.” For others it helped them see something new about themselves, but not in a way that made a huge impact for them.

For follow-up in the month until the last two days of the class, they worked on an action plan to test out what they had learned. The idea was to have a conversation with someone about their leadership feedback, and see if they could try doing one small thing differently that would challenge their assumptions identified in column four. The results of this work seemed to have mixed effect, seemingly dependent upon the depth of insight gained from the four column work and the student’s ability to create a really good experiment.

The last part of the course went through the last three or the social languages. With students all coming from diverse organizations rather than a team within one organization, this work was less directly applicable. It was more abstract and indirect for them to work on how they might apply these languages in their organizations, but it still appeared to be of value for them. Overall, I was quite happy with my initial application of the four column work, but was looking forward to learning more and trying it again.

Phase Two

Setting

The opportunity to try again came soon, as I was given the opportunity to do this work as follow up to some previous work a colleague in the UK had done with a senior management team of a public service organization. In preparation, I bought and read the *Immunity to Change* book. Having had the prior experience working with the four column exercise helped immensely when reading over the refinements that Kegan and Lahey brought to this new book. I also had a clearer focus for the two days with this team, allowing for taking more time in laying the foundations and allowing each step in the process have the time it required.

The main improvement I found in the new book was an explanation of why the four column work as originally designed had generally gotten really good results for only 60-70% of people. Kegan and Lahey provided a better explanation of the framing and pre-work that would enable people to generate the kind of first column commitment that would get the process going in the right way. They noted that if you start with something that is not a really core, crucial issue that will make a difference not only to you but also to those around you, then the whole process will be limited by only being able to reveal competing commitments and big assumptions about relatively unimportant matters.

Opening Moves

They also provided a much better integration of how to combine this work with teams as well as individuals. The three social languages are in essence gone, but in their place the methods for working teams through a collective four column exercise more than makes up for this. Taking this work, (and after an experiential exercise that revealed their organizational culture quite clearly) I began with asking the team to define an improvement goal for their department. I asked them to come up with just one thing that if it was able to happen, they felt it would make a substantial difference. They spent a couple hours developing a common vision and understanding for this, and appeared quite pleased with their work thus far.

They also appeared quite comfortable working at this level, which I observed was focusing on their department as an almost external entity. While they did see their role in things to a degree, it was clear that their attention was focused on the issues “out there.” The next step was to get them to come up with an improvement goal for how they as a senior management team operated within themselves.

This step proved to be a bit more challenging, as the natural inclination for their attention to stray to externalizing issues required occasional herding. It was clear that a reflective, introspective focus was not something they were accustomed to. Thus my herding of attention was necessary, combined with some framing to enable them to glimpse how this would be important to the larger department goals. This helped them stay on task and come up with a succinct, well phrased improvement goal that had themselves in the center of the picture.

Getting to the First Column

It was from using this section on team use of the immunity to change work that a foundation was built for them to move towards the individual work. I asked them to individually reflect on “one big thing” they could personally have as an improvement goal that would contribute to the team improvement goal. They then took this first step and worked in pairs to refine their improvement goal. To ensure that it met the criteria, the final step was to share it with the whole group, and hear from each person whether this improvement would make a substantial difference to that person. This process enabled a serious level of commitment and support to emerge for each participant, as the public sharing of their improvement goal and having it validated by their colleagues helped it meet the criteria for a first column commitment.

This process also provided an opportunity for some push back on the leader’s proposed improvement goal. At a subtle level the energy behind his goal was not as solid or deep as the others’ had been. At a practical level it did not meet the criteria in a variety of ways. The willingness of one of the team members to challenge him on this enabled the conversation to deepen for the whole team, and led to them contributing to the creation of the leader’s improvement goal. This new goal, then, converted along with those of the others into their first column commitments, enabled the process to move forward with a solid foundation.

Doing the above took up the entire first day, and even spilled over into the second day. My initial timeline for the work had them completing their second columns by the end of the first day. Thus we were somewhat behind schedule, yet it was clear to me that it was far more important to lay the groundwork well. The work of getting them to identify the second column items was fairly straight forward. Asking them to list all of the things that they did or did not do that prevented them from realizing their first column commitments led to long lists of behaviors that were easy enough for them to identify with a minimum of guidance. We were then ready to begin the more challenging work of turning their attention towards their generally unconscious and competing commitments in column three.

One of the things I had experienced during the first try at applying this work was that giving people the four columns all together on one page led to a number of challenges and back tracking. Some raced ahead and filled all four out immediately, thinking it was an action plan exercise. Others could not help but think and ask about the later columns, and made me jump around a bit to explain something coming later and get them back to being focused on the step we were on at the time. From that experience, I decided to use separate pages for each column's work, handing them out only as we got to that step. This kept everyone on track better, and enabled me to focus my instructions on other things. The primary area I was able to focus on this time was to check the natural tendency for them to move towards analyzing and rationalizing the items in column two, and generating the kind of "New Year's resolutions" Kegan and Lahey talk about as the typical way people respond to their second column behaviors. I found that this shepherding of their attention away from its natural course required plenty of attention, but also paid big dividends in that it helped them become aware of their thought system in action.

Redirecting and Aikido

This suspension of their normal patterns of thought and behavior created a more supportive space to enable the more challenging next step of generating their third column competing commitments. This stage of work reminded me of Scharmer's movement through the U process as they went from downloading past patterns and responses through suspending those and then as we moved into the third column work, redirecting their attention to places that were normally not visible to conscious attention. I have thought about this step as a kind of Aikido move, taking the natural energy generated by the first column commitments and self-generated obstacles and gently turning it to propel people into an internal space that normally hides from view and resists attention.

To accomplish this move, I followed the well laid out instructions and criteria Kegan and Lahey provide and asked the group to imagine what it would feel like if they did the opposite of the behaviors in column two. Getting connected with the affective aspect of this imaginative exercise further helped to redirect their attention away from the habitual drive to come up with rational solutions to the "problems" they had identified in column two. I emphasized that the method of this work was to counter such natural tendencies, especially given that such methods were in large part what produced the kinds of situations they found themselves in already. Rather than try to "solve their problems," we were going to aim to generate better problems that could "solve them."

As the group worked on generating their “worry box” as Kegan and Lahey call it, I could see that while some shepherding of attention was still required from time to time, they were getting better at holding themselves in this new space of attention that was opening for them. Once they had these worry boxes filled in with a firm hold on what they felt was at risk if they were to behave counter to their column two behaviors, I then asked them to convert their worries to commitments. In other words, simply take the worry or fear and reframe it, saying that they were committed to not having the worry or fear happen, such as “I am committed to . . . not having people dislike me.” These commitments were to involve both rational thinking as well as the feeling component they had gotten in touch with. It is in this simple reframing that the brilliance of Kegan and Lahey’s process becomes most apparent from my view. If the process has been done well and all the criteria met, it completes the Aikido move and lands people squarely in a place where genuine, deep and powerful insights are now directly in their line of attention rather than hidden from view.

As the group completed their third columns, there was a palpable sense of settling into a quality of energy where things were falling into place. I gave them a worksheet that allowed them to list all three columns on one page now, and just as Kegan and Lahey describe, they could suddenly see their column two behaviors as making perfect sense. These behaviors were now not simply their failures to live up to their commitments, but perfectly sensible behaviors that kept them safe in light of their now revealed competing commitment. They could see that simply trying to solve the “problem” of those behaviors was doomed to failure, since they were actions in service of equally powerful commitments to a kind of self protection.

Now we were ready to move into crafting the fourth column “big assumptions” that held them. This work went along fairly smoothly and with a little guidance they had their complete four column map of their own immunity to change. I was struck by the depth and simplicity of what were really archetypal human issues, and by the quality of authenticity with which they named, described, and sat with this x-ray into the depths of their psyche.

A student of mine who had observed the masters in organizational leadership class mentioned in phase one above brought to my attention the parallels between this process and Scharmer’s description of the stages of the U process. Reflecting on this, I could see how once the fourth column was done, one way to describe the quality of presence in the room could be in terms of Scharmer’s notion of presencing. People were certainly in touch with a deeper, more authentic sense of themselves and from this place could now be directed to look at what wanted to emerge in the future. The next step in this work, designing a safe test of a big assumption, would help crystallize their initial sense of this new direction.

Preparing to Make it Stick

By now it was already mid afternoon on the second day, and there was a need to make sure we moved the group through to completion of this step. The real benefit of the work done so far would only come with the implementation of well structured research projects that would again avoid fixing the problems identified, but rather gather helpful information on the big assumptions holding the entire system in place. The premise as I understand it from my own experience is that if you are able to sustain awareness of this system in operation, and test out new behaviors that might reveal a different picture than the one painted by the big assumptions, then the equilibrium of the system will shift and release itself without you having to force it. Change will happen, but you cannot "make" it happen.

On this basis, we worked to provide the team with a way to support each other in maintaining this stance after we left. After they each spent time drafting up a specific, concrete and actionable test of their big assumption, (supported by a set of worksheets to guide them through the steps of that process), I had each person share their test, and let everyone on the team be aware of how to support their learning after they ran the test. This gave them practical ways to follow up from the two days. How the work plays out for them over time remains to be seen, but there was no doubt that each and every one of them had stepped into a new world of possibility.

The closing check out bore witness to this. While there were many comments acknowledging the quality of work they had done, one in particular represented the sentiments quite well. The leader of this team described how he had been skeptical of the value of spending two days away from their already overloaded schedules. He figured that they would go through the motions and then get back to the "real world." He followed this by saying: "Now I have answers to questions I did not even know existed before."

Conclusion

From the above description, it should be obvious that I perceive my field testing of this work as a resounding success. Of course there is much more to learn about doing this work. But what was clear was that following the structure laid out and using the criteria and guidelines Kegan and Lahey provide to support facilitating the work should enable any reasonably competent facilitator to enable people to have powerful insights and begin the process of overcoming their immunity to change.

Kegan and Lahey describe throughout the book how the early work to understand the nature and structure of adult development was engaged in a dialectical process with praxis, and the testing of the ideas against the realities of human experience enabled an ongoing refinement of how to apply the ideas successfully. Thus my question at the beginning of this article of how the powerful understanding of adult development can be applied has a solid answer. Kegan and Lahey's *Immunity to Change* work provides the ingredients necessary to go beyond theorizing or describing and into actually enabling the first steps of transforming consciousness. While there may be further aspects to be revealed about what is required of the facilitator to support this work, the foundation is certainly solid in moving forward.

Paranada: Beyond Beyond

Hector Currie
with Juan Pacheco

Abstract: “Paranada: Beyond Beyond” represents the culmination of the author's research findings of geometric evidence in the Pythagorean design of the temple and theatre complex of the ancient Greek Temple of Delphi. Rather than a dualistic moral judgment, Delphic rites sought a dynamic equipoise between Apollonian and Dionysian psychic forces, transcending the self/boundless dichotomy. The temple has a deflection of 7.5 degrees—1/12th the 90-degree gravitational fall of all existents, the gravitational factor in music theory (as in the Pythagorean "harmony of the spheres") in each note's descent in the 12-tone scale's octaval fall. Significantly, this means that the Delphic design encapsulates a space/time concordance. The design reveals that Pythagoras' epochal concept of a transcendent *kosmos* is realized in both space (the sacred site's cosmic plan) and in time (the nightly celestial whirl of constellations above it). “Paranada” traces this discovery of a divine order at the Delphic center to the sages of the kingdom of Bharat in ancient India and the birth of speculation on the meaning of existence in their most sacred *Rig Vedic* "Creation Hymn" X. 129. “Paranada” thus suggests that the Western cultural tradition is derived not ultimately from Greece, but from India, and contemplates the significance such ancient visionary philosophical insight might have for the daunting challenges continually confronting us. This work constitutes an eclectic integration of transdisciplinary insights into the known and the unknown, the arts and the sciences, and science and religion. In descriptive and poetic forms, “Paranada” seeks to find vital correspondences and affinities among Pythagorean geometry; numerology; cosmology; ancient psychologies; nature philosophy and mysticism; Greek mythology; Greek, Shakespearean, and modern tragedy; quantum physics and astrophysics; and transcendent cosmic consciousness.

Key words: Anaximander, cosmology, equipoise, gravitational factor, Greek, harmony of the spheres, integration, nature philosophy, quantum physics, Pythagoras, Shakespeare, Temple at Delphi, tragedy, transcendence.

Introduction

Paranada is Sanskrit for that which is beyond the beyond, the transcendent “soundless sound” from which creation emanates (“Soundless Sound,” 2008), thus nature's "soundless sound beyond creation" (Omega Institute for Holistic Studies, 2006).

This work, “Paranada,” honors Pythagoras' profound psychic insights into the nature of existence and transcendence, which, it is here contended, hearken back to the Vedas, or early Hindu sacred hymns. These Vedic texts beckon us to see beyond—even beyond "beyond."

The concept of transcendence found in early Vedic thought inspired Anaximander, an early Greek philosopher. Anaximander in turn inspired his contemporary, Pythagoras, as evidenced in the visionary geometry he infused in his design for the sacred Delphic site. Pythagoras' intricate Delphic design reveals that he had insights into nature that transcended space and time. For over two millennia, this secret has been forgotten. It is this author’s contention that the time has come to rectify this egregious neglect.

This paper is organized chronologically, aiming to integrate ancient elements with their contemporary implications, which led to key findings from research on the plan of the Temple at Delphi. From there, the author offers his interpretation of the significance of Delphi's plan and the "cosmic secret" the author regards as Delphi's contribution to humanity.

The first section is a brief discussion of the birth of philosophy in the Eastern world, and the mystical hints we have of its transcendent approach, and includes the author's speculation on the transmission of Eastern thought to the West. The author develops a sketch of Anaximander's contributions to the birth of philosophy in the Western world, insofar as they appear to have influenced Pythagoras.

With these foundations laid, the central section develops the thesis about Pythagoras' insights into transcendence. First, the layout of the Temple at Delphi is described. Then, the measurements of Delphi's geometry are presented, including the author's discovery. Next, the author develops his interpretations of the cosmic significance of Delphi's geometry. The final section highlights selected points of the nature philosophy suggested by this ancient site so as to correlate them with insights of contemporary science, joining the ancient and the modern. The conclusion presents the author's advocacy for bringing more of Delphi's harmony into our modern world.

Dighatamas and the Birth of Transcendence in Vedic India

Approximately 2000 BCE in India, then called the Kingdom of Bharat, there lived a blind-from-birth Vedic seer, Dirghatamas. Reverently known as "Long Darkness," Dirghatamas became the high priest to King Bharat. In his enveloping darkness, Dirghatamas had a blinding vision which he captured in moving poetry, the key phrases excerpted below:

Then was neither being nor non-being… (line 1)
The breathless breathed breathlessly… (line 2)

> All was darkness wrapt in darkness… (line 3)
> …Sages searching in their hearts with wisdom found the bond between being and non-being. (line 4)
> …This was before the gods… (line 6)
> *Creation Veda* X.129[1]

Georg Feuerstein (1996) credits the seer-bards who composed the *Vedas* in the third millennium BCE, with bringing about the birth of Eastern philosophy through their recognition of the “curious relationship between the outer cosmos and the inner universe, between the objective world and the subjective space, or psyche.” Feuerstein identifies this interconnectedness as the apparition discerned by the Vedic seers: "The deep mysteries of the universe and what lies beyond creation."

The vision of Dirghatamas, author of hymns 140 to 164 in the first section of the Rig Veda, takes an iconoclastic perspective, a logical approach that discriminates fact from fancy.

> To the Vedic sages, creation indicated that point before which there was no Creator, the line between indefinable nothingness and something delineated by attributes and function, at least. Like the moment before the Big Bang Theory. These concepts preoccupy high wisdom, the Truth far removed from mere religion. The Bible begins with the Creation. Before the Creation, however, there was the Creator, but does even He know what was there before He existed? (Londhe, 2008)

Dirghatamas' intuition/perception of abstract physics of space and time—of space/time—is truly phenomenal. In his Vedic Hymn, I. 164, he divined the sexagesimal (12) order of time in the movement of the planets and celestial firmament across the night sky, thus producing man's first astral zodiac (Griffith, 2006/1896, p. 220). This set the measure for what the Greek philosopher Anaximander would describe as the "eternal motion,” which is time, marked by the day's solar arc and the night's majestic celestial round (quoted in Burnet, 1908, p. 55). Dirghatamas saw the number 360 as dividing the temporal circle of the year in the zodiac, as well as the sun's circle of the day. He also broke the circle into 360 degrees.

The hymns of Dirghatamas speak clearly of a zodiac of 360 degrees, divided in various ways, including by three, six and twelve, as well as related numbers of five and seven. We must remember that the zodiac is first of all a mathematical division of the heavens such as this hymn outlines. This is defined mainly according to the elements, qualities and planetary rulerships of the twelve signs. The symbols we ascribe to these twelve divisions is a different factor that can vary to some degree. The actual stars making up the constellation that goes along with the sign is yet a third factor. For example, some constellations are less or more than thirty degrees, but the mathematical or harmonic division of each sign will only be thirty degrees. What is important about the hymns of Dirghatamas is that he shows the mathematical basis of such harmonic divisions of a zodiac of 360 degrees.

---

[1] There is no standard translation of the Vedas, but a multiplicity of them, due largely to the age of the text and the inherent difficulty in translating it. Additionally, there is a tradition of authors interpreting and phrasing the Vedic hymns. The phrasing of the lines from the Creation Veda 10.129 are the author’s own, based on a number of translations, primarily Griffith (2006/1896) and Moore and Radhakrishnan (1957).

> For Dirghatamas, as was the case for much of later Vedic astronomy, the main God of the zodiac is the Sun God called Vishnu. Vishnu rules over the highest heaven and is sometimes identified with the pole star or polar point, which in the unique view of Vedic astronomy is the central point that governs all celestial motions and form which these are calculated. (Frawley, 2006)

Dirghatamas also divided the circle of the compass at a sacred Vedic fire altar, a measure that would later be reflected in the Delphic *temenos*. With visionary foresight, Dirghatamas set the course that quantum and astrophysics only now are coming to sense/intuit. And yet, Dirghatamas is little known or recognized in the West.

The Brief Flowering of Transcendence in the Archaic/Classic Age of Greece

Following its inception in India, transcendence enjoyed a brief flowering in Greece. The foundation of Western philosophy and science laid down in Grecian schools was born from the concepts crystallized in India centuries before, which came to have a profound impact on Greek thought.

> The flowing of this influence and the accuracy with which the doctrines were transmitted suggests a direct contact between the thinkers of the two countries rather than knowledge acquired through intermediaries. The clarity with which Greek philosophers propounded their views presupposes a familiarity with a subject that can only arise when all doubts and dissentions have been resolved through discussion. Plato and Democritus, it is told, traversed the long distance to the Indian sub-continent to confer with Indian sages as did Pythagoras at an earlier date. (India Holiday, 2009).

The Persian Empire under Cyrus II controlled an unprecedented swath of territory, running from the Indus River in the east to the Dardanelles in the west. The trade routes radiating from Babylon would have made it possible to travel from the coastal cities of Asia Minor, such as Anaximander's Miletus all the way to India (Long, 1948, p.9).

“An age of intellectual activity in both India and Greece occurred between the 6th and 4th centuries BC” (India Holiday, 2009). Greek knowledge of India was acquired on the whole by way of Persia, whose emperor Darius the Great (c. 515 BCE) extended the reach achieved by Cyrus into the Indus valley. It is significant that “Greek philosophy originated in the cities of Ionia on Asia Minor's western shore—that portion of the Greek world closest to the Orient” (Sedlar, 1980, p. 10). There was an intense metaphysical interchange between the Greek and Indian cultures around 600 BCE that points to striking similarities between the two metaphysical schemes (McEvilley, 2002).

The Birth of the Philosophy of Nature

Anaximander was from the port city of Miletus on the Aegean Sea, a key port on the trade routes from the East bound for Egypt. He was therefore exposed to the ideas that flourished in the minds of Milesian nature philosophers. These philosophers were, during this time of the 500s BCE, beginning to break the mythic past and develop a scientific approach, beginning with the basic question, "What is the world, and all that is in it, made of?" The nature philosophers Heraclitus, Anaximenes, and Thales, respectively identified the *arche*—the basic principle of all that exists —as fire, air, and water; each predating the formation of earth.

For Anaximander, who had been exposed to the influence of visionary Asian philosophical thought, such speculation based solely on the physical/material nature of existence must have seemed inadequate. Anaximander boldly broke with the materialist bent of his philosophic confreres. He conceived the ground of being—the-basis-of-it-all (and, he might have added, the-basis-of-the-none)—as "the Boundless," or the *apeiron* (from the Greek *a-peras*, without limit). This is reminiscent of the Hindu *Moksha*, the doctrine of the transmigration of souls in a transcendent release.

This apprehension is evident in Anaximander's first conception of the world in a map he drew on a cylindrical disc, with Asia to the east, Europe to the west, and Delphi at its center (De Santillana, 1961 p. 36).

Giorgio de Santillana (1961) was moved to describe this revelation as "comparable only to the discovery of fire" (p. 36). Nietzsche (2001), in awe of Anaximander's audacity in breaking free of the limits of matter, termed it "an incredible leap" (p. 33).

In the one surviving fragment of his treatise "On Nature," Anaximander expressed an Eastern/Vedic grasp of the control time exerts over nature's ineluctable process of coming-to-be and passing-away. A. N. Marlow (1954) noted that Anaximander envisions this control as “an immanent dike [that] ensures that all things shall eventually return to the apeiron whence they came” and went on to reproduce Anaximander’s fragment “From which all things take their rise, and by necessity they are destroyed into these; for all things render just atonement to one another for their injustice according to the due ordering of time” (Diels & Kranz, 1951, p. B1, as cited in Marlow, 1954, p. 37).

Numeric mysticism played a key role in Anaximander's philosophy of nature, as in Pythagoras' declaration: "All is number" (Burton, 2003, p. 64). Anaximander's vision of cosmic order conceived the distance of the fiery circles of the stars from disc-shaped Earth as a ratio of the breadth of Earth: 9, 18, 27, and as a ratio of its depth: 27, 54, 81, all based on 3, the three of space's three dimensions. The key number—the ratio of the Earth's depth to its distance from the Sun—was 81, 3 to the 4th power ($3^4=81$), as space (three dimensions) to time's (the fourth dimension) power. Numerologically, 3 plus 4 produces 7, Apollo's sacred number. The ratio of the sun's wheel of fire to the breadth of disc-shaped Earth is 3 x 9 = 27 in Anaximander's first cosmic scheme. Numerologically, 27 is 2 + 7 = 9, nine, the fateful penultimate number of Saturn-Time in Philolaus' Pythagorean Table of Planetary Spheres. Time, which, per Anaximander's fragment orders all things (McEvilley, 2002, p. 31) and which occupies the penultimate position in the eternal round, of the decad (10), therein transcends the sphere of Stars, and mystically attains "The Boundless," the infinite, *apeiron*.

Anaximander's concept was amazingly prescient. It conceived of a boundless void—a vacuum, a nothingness.

The Time of Pythagoras c. 580–490 BCE

Pythagoras ushered in the Golden Age of Greece. He was the son of a successful Phoenician merchant, Mnesarchus of Tyre. Mnesarchus was granted citizenship by Samos for his gift of grain to that drought-stricken island. Before the birth of Pythagoras, Mnesarchus consulted the Pythia, the Oracle at Delphi, regarding his trading ventures. The Pythia did not respond to his questions about trade. Rather, in a story retold by Iamblichus in *On the Pythagorean Life*, she predicted his son would “surpass humans of all times in beauty and wisdom and would be of the greatest benefit to the human race with regard to the whole of life” (Riedweg & Rendall, 2005, p. 6). In response to the prophecy, Mnesarchus named his son Pythagoras. In further tribute to the Oracle, his wife changed her name to Pythais in honor of “Pythia,” the Delphic Priestess.

Pythagoras was educated and inspired by Pherekydes of Syros. Pherekydes was born in the time of the 45th Olympiad, 600-597 BCE, and was in his prime c. 544/1 BCE (Schibli, 1990, prologue). Pherekydes is the author of what is believed to be the first prose work of Greek literature, *Theologia*, generally known as *The Seven Adyta* (Mead, 1965, p. 21). *Adyta* is closely related to the Sanskrit *Aditi*, the Vedic goddess of the boundless sky, who can be seen as a precursor of the Anaximandrian/ Pythagorean concept of the "Boundless."

Pythagoras “was educated for 20 years in astronomy, geometry, medicine, psychology and mathematics in the Vedic institutes of Egypt” (India Holiday, 2009). Felix M. Cleve (1969) argued that even though Pythagorean society appears to exhibit in its organization an Egyptian pattern, its real roots can be traced back to India, specifically to Indian *Samkhya* philosophy (Navia, 1990, p. 139-40). Samos “had close commercial links to an Indian community in Memphis, Egypt, that would have given Pythagoras access to Hindu and Egyptian knowledge” (Occhiogrosso, 1994, p. 308).

Anaximander and Pythagoras knew each other (they were coexistent for 24-34 years), exchanged ideas, and at times put forth competing or differing on concepts (Pengelly, 2005). Pythagoras embraced Anaximander's boundless *apeiron*, naming it *Kosmos*. He proposed that the highest state the spirit can achieve is what he conceived to be the Boundless.

It should not surprise us, then, to discover, by connecting the dots and counting the angles of the geometric shapes contained therein, that the key to the *Tetractys*, the most sacred Pythagorean symbol by which solemn oaths to secrecy were sworn, is also 81. The geometric shapes within the *tetractys* have a total of 81 angles: 13 triangles (39), nine rhombi (36), and a hexagon (6).

The Transcendent Power of Delphi

The number of the *Tetractys*, 81, is also the key to the god of order, Apollo. Numerologically, 81 is 3 to the 4^{th} power; 3 + 4 = 7, Apollo's symbolic number. As the god of music, his seven-string lyre produces "the harmony of the spheres" (Wyss, 1996, p. 37). At Apollo's cosmic center, Delphi, Pythagoras plotted the *tetractys* on the sacred site (Figure 1).

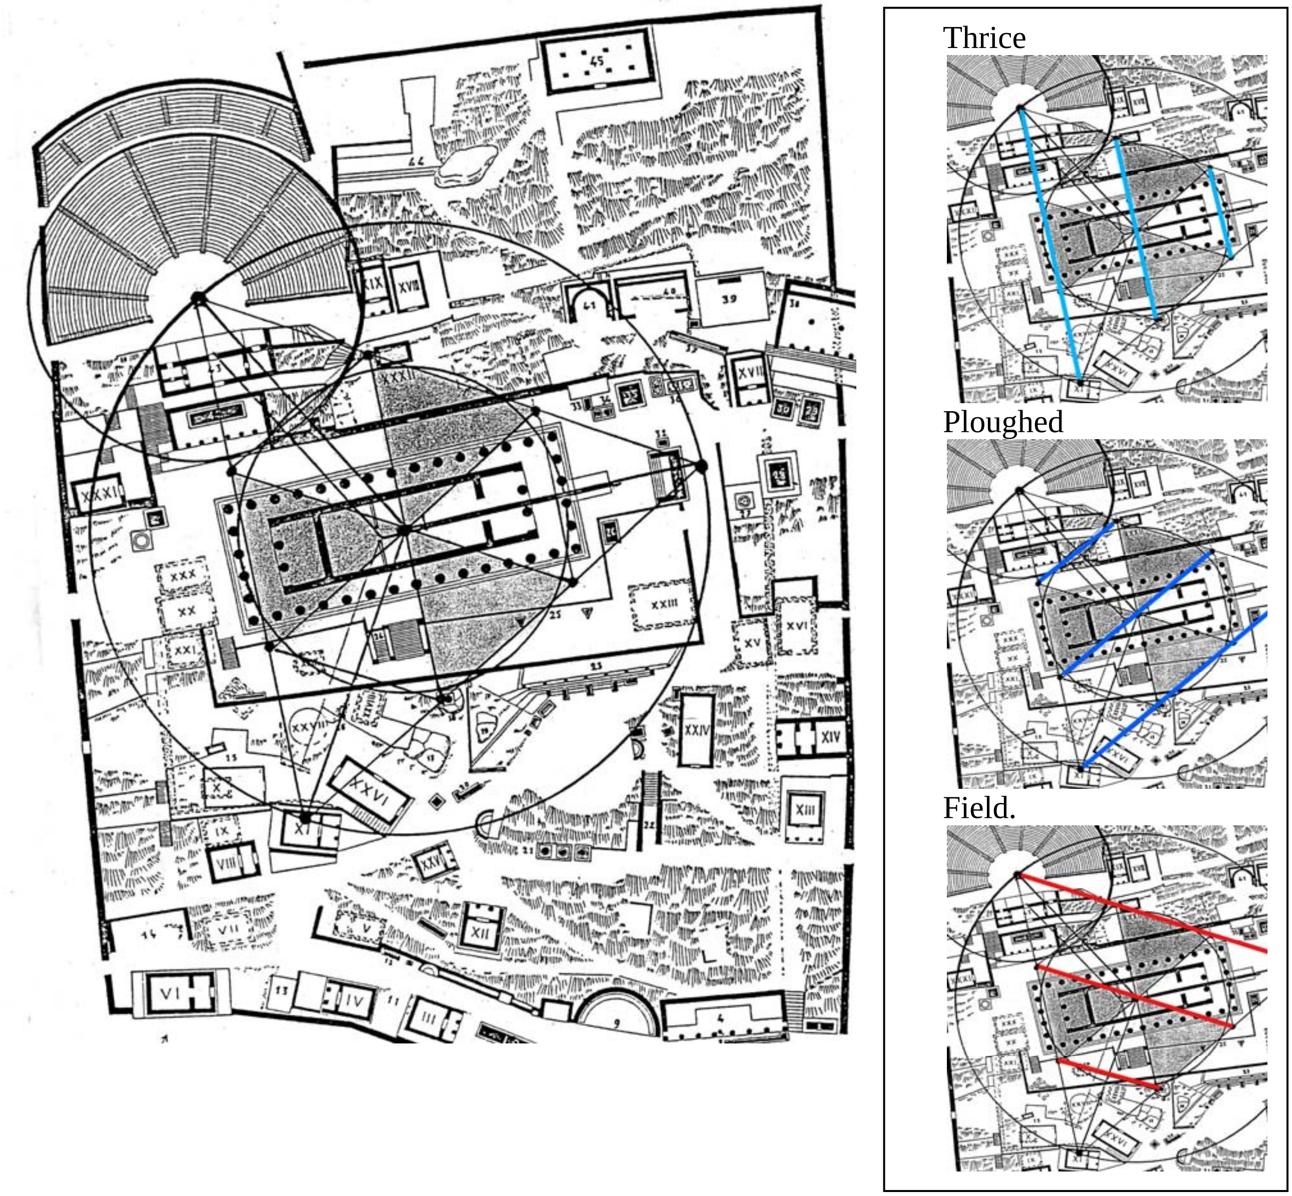

Figure 1. Site Plan of the Sanctuary of the Temple of Apollo at Delphi ("Themenos of Apollon in Delphi," Coste-Messeliere, 1936, foldout)

Its apex is in the center of the theater of Dionysos, its tripod-center is in the cosmic center of the temple of Apollo. Its other two corners terminate in the Treasury of the Athenians and at the point on the Sacred Way fronting the Temple (dark blue line Figure 2). The precision of the loci of the four *tetractyl* tripod's center and termini on Delphi's steeply sloping site evidences the precision of Pythagoras' plan (and, it might be added, the meticulous precision of the Pierre de la Coste-Messeliere survey!).

Figure 2. Topographic Tripods of Centers and of Thresholds ("Themenos of Apollon in Delphi," Coste-Messeliere, 1936, foldout)

The location of the center and termini does not exhaust the mystic design of Delphi. In addition to the Tripod of Centers, in the middle of the Temple of Apollo, and extending its legs to the center of the Theater of Dionysos, and to the Treasury of the Athenians, there is a second topographic tripod. The Tripod of Thresholds, (light blue line) centered at the threshold to the inner sanctum, or the *adyton*, indicates where the Pythia, seated on the mantic tripod, uttered her veiled prophesies.

Its apex is in the central doorway (threshold) in the stage-house of Dionysos' theater, through which the tragic hero retired to face his fate. Its second, lower, terminus is at the cleft (threshold) by the Mound of Earth (Gaia), first holder of the Delphic seat before it was wrested away by Apollo from Phoebe, the third to hold the seat, to whom the scapegoat (*tragos*) was sacrificed. The third terminus of the Tripod of Thresholds is at the base of the ramp fronting the temple where the suppliant paused before entering.

The *Tetractys*, it will be noted (Figure 1), consists of ten points and three sets of parallel lines that cross. The lines might be seen as the furrows of Themis, the goddess of justice and of the thrice-ploughed field, and, after Gaia, second holder of the Delphic seat. A field ploughed thrice, diagonally right, then left, then horizontally, will produce an array of hexagons. Analyzing the pattern, each hexagon has radiating from its six faces six additional hexagons: three above its mid-point and three below. It fittingly constitutes a schema of the Scales of Themis, representing justice.

Pythagoras thought he had found the key to the universe concealed in the geometrical lines of the Delphic temple. Amazingly, for 2500 years it has remained a mystery. Or, perhaps, not so amazingly: Pythagorean brotherhood, the Mathematikoi, was a secret society, its members sworn to secrecy under threat of death.

How Pythagoras managed to accomplish the survey on the steeply sloping site remains a mystery, though we know he spent over 20 years in Egypt and while there may well have mastered the art of land surveying, so vital to Egypt's economy. The quality of the ropes used in the topographic survey of the Delphic sanctuary was a crucial factor in its successful execution. The ropes came as a gift from the last great Egyptian pharaoh, Amasis, who contributed one-fourth of the cost of the reconstruction of the temple. The gift was believed until recently to have been of alum. James Calvert (1999) has suggested that a transcription error by a scribe explains the unlikely gift of alum, a styptic agent, to a construction project. Rather, he suggests, with the change of a single Greek character, a gift of "alum" becomes a gift of "rope," fine Egyptian linen survey rope.

The Numerical Significance of the Trieteric Rite

The Pole Star is the center of the zodiac. The zodiac measures the cycle of the year. The Greeks noted a rhythm in the passing of time within the year, comprised of beats to a four count. That is to say, 1-2-3, 1-2-3, 1-2-3, 1-2-3, thus completing the cycle. This is equivalent to the three months to each season, with the four seasons constituting a year. The four repetitions of the 3/4 waltz-like rhythm may be seen as suggestive of the leaping rhythm of the Goat (*tragos*) Song of the Dionysian *dithyramb*.

The Greeks observed this repetitive beat in the heavens and perceived its seasonal effect on nature. They noted it was the rhythm in the lunar cycle, as well as that of the solar. The moon was envisioned as moving through four phases, divided into the three-phased (crescent-full, decrescent, and the new, or no-moon-at-all when "the inconstant moon" was dark or absent), each lunar cycle comprising roughly one month. The solar year was conceived in like manner, based on the sun's effect on nature's cycle: spring's birth-growth, summer's coming-to-fullness, autumn's harvest-reaping, and winter's “death.”

With the advent of spring at the vernal equinox, nature was renewed and the cycle began again. This cycle was the temporal basis for the Greek trieteric rite of spring, the celebration of the round dance of life, death, and rebirth. It was the celebration of nature's inexorable coming-to-be and passing-away, *ad infinitum*.

The Dionysian rites were performed in the winter quarter. Their culmination was the trieteric rite of spring, when women bore the infant Dionysos in a winnowing basket symbolically divided into three parts. In the wild dance of Dionysos' *maenads*, women recreated the cosmic whirl of chaos, whirling their baskets, the winnowing action casting the chaff to the periphery, while allowing the grain kernel, the precious seed, to remain and to be sewn in the fecund Earth (Gaia). The basket's whirl marked the creation of the cosmos in Anaximander's first cosmic scheme.

The trieteric festivals were biennial events as determined by the dactylic meter of the leaping Goat Dance of the dithyramb, and of the transcription by priests of the *Pythia's* frenzied chants into dactylic-hexameter. Thus, "ONE-two-three, THREE-four-five, FIVE-six-seven" would result in rites in the first, third, and fifth years, constituting the first of three triads of rites culminating in the seventeenth-year rite, and include in its span the eighteenth. This cycle of 8.6 years marked a squaring of the solar/lunar calendars.

The lunar aspect of the trieteric rites suggests they might have been in honor of the moon goddess, Phoebe, third holder of the Delphic seat. This lunar aspect is revealed (the hexagon of geometric forms in Figure 3, below) when the sequence of biennial rites' yearly numbers is taken into account, and the overlaying in the *tetractys* of numerically equivalent geometric shapes is effected.

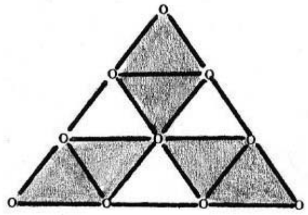

Figure 3. Tri-armed *Tetractys* (© Hector Currie 2004)

Years 1 + 3 + 5 equal 9. Three two-tiered triangles, superimposed, produce a tri-armed Maltese cross, a rotary symbol, closely akin to the running tri-legged *triskelion*, emblem of Trinacria (Sicily), near Pythagoras' Croton. Years 7, 9, and 11 total 27. There are nine single-tier triangles in the *tetractys*. Thus the *triskelion* prevails in this, the second triad of trieteric rites: Years 13 + 15 + 17, totaling 45, involve the superimposition of the 9 diamonds (36), the hexagon (6), and the three-tiered triangle (3).

This produces a silver hexagonal disc (the superimpositions having been of segments of the argent heavens), which might be seen as a token to Phoebe, the moon goddess, third holder of the Delphic seat, and as recognition of the 18.6-year squaring of the solar and lunar calendars.

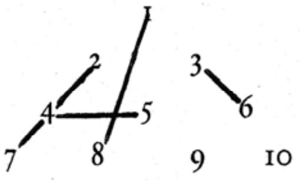
Finally, and most significantly, the Pythagorean *acousma* (catechismal instruction), heard (acoustically) by learners of the sect, clearly states the *tetractys* is the key to Delphi's mysteries. Iamblichus in *The Life of Pythagoras* includes some of these acusmata, including an important one about the Delphic temple, “What is the oracle at Delphi? The tetractys, which is the harmony in which the Sirens sing” (quoted in Bakalis, 2005, p. 18). The Sirens here stand for the planets or crystalline spheres that produce the harmony of the universe.

In the *Tetractys*, 10 (Gk., *tetra*, 'four,' a four-row pyramid of 1, 2, 3, 4 points, totaling 10,) is the key to Pythagoras' cosmic scheme, ten being the perfect number for Pythagoreans. This most sacred number expressed the mysteries of the *kosmos*. To Pythagoras, it represented the universe and the unknown depths of the soul.

There are ten points in the *Tetractys*, and ten heavenly spheres in the Pythagorean Table of Planetary Spheres, as Pythagoras' disciple Philolaus recorded some time after his spiritual leader's oral pronouncements:

1. Counter Earth
2. Earth
3. Moon
4. Sun
5. Mercury - Hermes
6. Venus - Aphrodite
7. Mars - Ares
8. Jupiter - Zeus
9. Saturn - Cronus
10. Stars-zodiac, and the *apeiron*, "The Boundless."

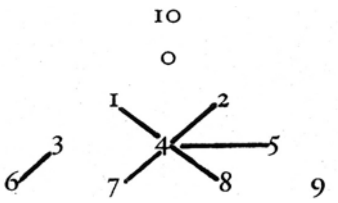
If Counter Earth (placed between Earth and the throne of Zeus at the center of the universe to stop man from looking directly at the godhead) is accorded the prime placement at the *Tetractys'* apex (1), it makes no symbolic sense when paired with Jupiter-Zeus (8), to total 9. When other pairs are so plotted, they also reveal a lack of symmetry and symbolic affinities in the pairings:



1 Counter-Earth
2 Earth 3 Moon
4 Sun 5 Mercury 6 Venus
7 Mars 8 Jupiter 9Saturn 10 Stars/*apeiron*

Figure 4. Counter Earth at Apex of *Tetractys* (© Hector Currie 2004)

Contrariwise, place the Pythagorean Central Fire of origin—0 —at the apex of the *tetractys* (which makes eminent sense, the *tetractys* being a diagram of the cosmos and its creation), and there emerges a symmetric pattern, and a symbolic affinity, in the planetary pairings.



10 Stars/*apeiron*
0 Central fire
1 C'ter E.   2 Earth
3 Moon   4 Sun   5 Mercury
6 Venus   7 Mars   8 Jupiter   9 Saturn

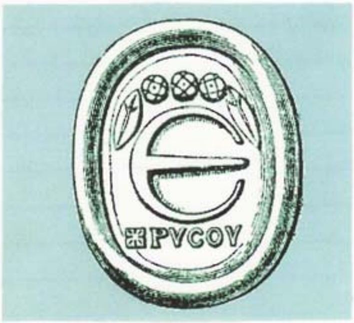
Figure 5. Central Fire at Apex of *Tetractys* (© Hector Currie 2004)

The Central Fire's prime placement at the *tetractyl* apex is symbolically apt, insomuch as a sacred fire burned at the *thymele*, the altar of Hestia, the hearth of the universe, in the center of the theater's circular orchestra. It stood as a symbol of the ecstatic, generative energies of Dionysos. Further each pairing of heavenly spheres might be noted to total nine to produce a symmetry of design, with Apollo, the Sun, appropriately, in the center, and Saturn—"Time, the governor," per Anaximander's fragment (Diels & Kranz, 1951, as cited in Marlow, 1954, p. 37)—isolated in the *Tetractys'* ninth position.

The Mysterious "E" at Delphi

PLVTARCHVS

utexas edu. classics/chaironeia/Plutarch



penelope.uchicago.edu/plutarch

Figure 6. Plutarch (Mayer, 1997)
Figure 7. Roman Amulet (Plutarch, 2006, note 6)

Plutarch (2006), a Delphic high priest, (Figure 6) in "On the 'E' at Delphi" asked rhetorically, "What is all this to Apollo?" His response, "Much, we will answer, not to Apollo only but also to Dionysus, who has no less to do with Delphi than has Apollo." Then, remarkably, he revealed the secret of secrets, that the divine is unified despite the fractured perceptions of humanity. He characterized the different perspectives of human beings. Theologians assert that "the God subsists indestructible and eternal…and passes through changes of his person; at one time he sets fire to Nature and so makes all like unto all, at another passes through all phases of difference — shapes, sufferings, powers — at the present time, for instance, he becomes 'Cosmos.'" The "wiser people" call him "'Apollo' from his isolation [and] 'Phoebus' from his undefiled purity." Other changes they describe metaphorically as "rendering and dismemberment" and call the God by different names, “Dionysus or Zagreus or Nyctelius or Isodaites” and construct “riddles and tales to match the changes.” The God offers a prescription for this confusion, “the phrase ‘KNOW THYSELF’ seems to stand in a sort of antithesis to the letter ‘E’,” a consecrated letter in the Delphic temple, “and yet, again, to accord with it. The letter is an appeal, a cry raised in awe and worship to the God, as being throughout all eternity; the phrase is a reminder to mortal man of his own nature and of his weakness.”

Regarding the Roman amulet (Figure 7), C. W. King perceptively noted, “The symbol, which is preserved to us by amulets, was indeed similar in shape to the lunar ϵ but then that character was unknown before Imperial times. In all probability it was an Indian cast mark; and imported like the Swastika or Fylfot, and many other Indian symbols, in prehistoric times" (as cited in Plutarch, 2006). The first impression of the amulet is of a circular "C" with a horizontal arrow through the aperture toward, if we are to believe Plutarch, the Cosmos. This brings to mind the Vedic *Shiva's* male member mythically projecting beyond infinity. For, at the spring equinox, as well as the meridian at midnight, the “far-darting” arrow of Apollo (and Sagittarius) is projected from the center of Dionysos' sanctuary (building XXXI), and soars, bearing the spirit of initiates toward the Pole Star at the center of the celestial whirl, and beyond beyond, to the boundless *apeiron*.

While the angularity of its arrow-form is unlike the Greek epsilon, the mysterious "E" at Delphi may be read as a stylized arrow form "E." This arrow form directs the powers of hermetic wisdom (Mercury-Hermes) from the Sun (*Phoebus* Apollo) in a recognition of feminine (*Pythian*) intuition toward the reflective lunar sphere (Phoebe). Dirghatamas identified the sun with the pole star, which ties in to the trieteric rite of Dionysos at Delphi, where it is envisioned as the target for Apollo's far-darting arrow transcendentally bearing the spirit "beyond beyond." Thus, from a high priest of the Delphic Oracle we have it: the vernal trieteric rite of rebirth/renewal of nature is Dionysos'; his, the mystery of the spirit's transcendence.

Transcendence: The Key to Equipoise Between Apollonian Order and Dionysian Ecstasy

Delphi is famous as the seat of Apollo, the god of reason, of limit. The Delphic motto is "Know thyself," the stern injunction inscribed at its temple portal. Delphi is also home to Dionysos, the god of instinct, of un-limit, the boundless *apeiron*. Somehow the two gods, so seemingly opposed at a fundamental level, gained here, at the center of the cosmos a mysterious equilibrium of force-counter-force, of materiality contra immateriality, of Being contra Non-Being.

Transcendence is the key to the tragic dithyramb of the god of frenzied ecstasy, Dionysos, the god who dies to be reborn in the trieteric rite of spring: *tri*-(three), *e*- (from) *ter*- (three) equals zero, i.e., is of non-existence. Transcendence is also the key to the “far-darting” arrow of the god of order, Apollo; the key to one, and none—freed from the confines of space and time, transcendent.

The mundane world was largely unaware of this balance of psychic forces at Delphi's cosmic center. The Pythagorean code of secrecy saw to that. Though there is a celebration of transcendence in Sophocles' Oedipal trilogy at the end of the Classic Age, the Hellenistic age which followed the Classic lost the great age's high tragic vision.

With the advent of Hellenistic moralism in the 300's BCE, the free spirit of the transcendent nature philosophy of Pythagoras was replaced by judgmental strictures. Nature philosophy's preoccupation with the abstract, with creation and "cosmogony," with the foundation of existence (and non-existence), was replaced with worldly concerns about order and equity in the affairs of man, and with moral concerns affirming the good and castigating evil. The boundless, the limitless, was classified as evil; limit, as good, in the Pythagorean Table of Opposites. Limitlessness was associated with the void. This, Aristotle could not abide, declaring, "Nature abhors a vacuum."

The *apeiron* was dismissed out of hand without a counter argument; the transcendent was soon forgotten. For some two millennia the *apeiron* has largely vanished from public consciousness. As of 2005, no English dictionary (except Klein's, 1966, *Etymological*) so much as lists the term, though it is the title of recondite scholarly journals of archeology and advanced physics. Yet it was at the very heart of Pythagoras' philosophy of nature. He placed it at the pinnacle of his sacred *Tetractys*. The *tetractys* is Pythagoras' key to the mystery at Delphi, its "root and fount," as his *acousma* (oral teaching) declared (as cited in Iamblichus, 1986/1818, p. 87).

The anonymous Homeric Hymns attributed the design of the Delphic *temenos* to Apollo (“To Pythian Apollo,” 1914, ll.254-276, p. 343), which seems but a mythic fantasy. Yet, it is inconceivable that Pythagoras could have established the basic coordinates of the centers of Apollo's temple and Dionysos' theater, orienting toward the northeast, rather than, as with temples in the East and West, facing due east to greet the equinoctial rising sun.

When Apollo wrested control of the Delphic seat, it had a long mythic past, having been the domain successively, of three goddesses: Gaia, Themis, and Phoebe. Apollo imposed a masculine order on the sacred site. Yet, before Apollo, Themis, the goddess of justice and of the thrice-ploughed field, gave form to the Pythagorean *Tetractys*, which brought tri-form order to the oracle at Delphi. Gender issues aside, one can only surmise that the Homeric Hymns spoke the truth: Delphi is the mythic seat of cosmic mystery of Apollo, the god of order (“To Pythian Apollo,” 1914, ll. 179-181, p. 337).

The Greek and Vedic Gods of Nature

To understand Delphi is to grasp its transcendent purpose. Its roots go deep into the Greek consciousness before the Anaximandrian breakthrough to the Boundless, deep into the realm of myth involving the gods of nature, both Greek and Vedic.

The three original holders of the Delphic seat were feminine: first Gaia, the earth goddess, followed by her daughters, Themis, the goddess of justice and of the thrice-ploughed field, and Phoebe, the goddess of the tri-phased moon (Kingsley, 1995, p. 46).

Sita, the Vedic goddess of the furrow (Frawley, 1992, p. 242). She would appear to be the Indian counterpart to the Greek goddess Themis, second holder of the Delphic seat and "goddess of the thrice-ploughed field," order-bringer to the sacred Pythagorean *Tetractys*.

The Vedic god *Vishnu,* the sun god, relates to Delphic *Phoebus* Apollo, the Greek sun god; in the trieteric rite of Dionysos, the sun is identified with the pole star, envisioned as the bull's-eye target for Apollo's "far-darting arrow," transcendentally bearing the spirit beyond beyond.

The Greek-Vedic conceptual connection is evidenced by the Greek *Seven Adyta* of Pherekydes coinciding with the Vedic seven chakras. *Chakra* (in Sanskrit disk or wheel) signifies one of seven energy centers or levels of consciousness. The seven chakras are associated through yoga with the Hindu god *Shiva*, god of destruction and rejuvenation (Mallinson, 2007, p. x).

The similarities between the Greek and Indian pantheons was known in ancient times.

> The Greeks explained the similarities in the cults of Shiva and Dionysos by a journey of Dionysos to India…. According to Diodorus, it is due to the memory of his expedition to India that the Boetians, the other Greeks, and the Thracians, instituted trieteric sacrifices to Dionysos. (Danielou, 1992, p. 38)

And this was not the only influence. According to Martin West (1971):

> It was the very extravagance of oriental fancy that freed the Greeks from the limitations of what they could see with their own eyes, led them to think of ten-thousand year cycle ... of an infinity beyond the visible sky and below the foundations of the earth, renewed … aeon after aeon (p. 67).

The Roman Twilight of the Gods of Nature

The Roman twilight of the gods marked the period of Rome's slow decline from its zenith architecturally, with the dedication in 125 CE of that marvel of Roman engineering, the Pantheon. Rome reached its nadir with the death of her last pagan (i.e., believer in the Greek pantheon of the gods of nature enshrined at Delphi), Emperor Julian, branded The Apostate. The Roman twilight also marked the slow fading of the light emanating from the Delphic Oracle. And with the Pythia departed the balance of the gods of nature, Apollo and Dionysos. We examine this slow fading of the light of pagan Rome and Delphi, in the person of the two Roman emperors who embraced the Greek nature gods and their mystery. We will trace the Roman sun's rise to its heights, and its decline into the darkness, which ultimately enveloped the Delphic flame. In 390 CE the flame at Delphi was demolished by the order of Emperor Constantine.

Hadrian's Visionary Pantheon

The Emperor Hadrian was committed to a distinct vision of Greece as a sacred land. In 120 CE, he

> began designing a Pantheon reminiscent of Greek temples…. The rotunda's internal geometry would create a perfect sphere, since the height of the rotunda to the top of its dome would match its diameter …[its] height to match its diameter, 142 feet (43.30 m). At its top, the dome would have an oculus or eye, a circular opening, with a diameter of 27 feet (8.2m), as its only light source. Hadrian said, "My intentions had been that this sanctuary of All Gods should reproduce the likeness of the terrestrial globe and of the stellar sphere...The cupola...revealed the sky through a great hole at the center, showing alternately dark and blue. This temple, both open and mysteriously enclosed, was conceived as a solar quadrant. The hours would make their round on that caissoned ceiling so carefully polished by Greek artisans; the disk of daylight would rest suspended there like a shield of gold; rain would form its clear pool on the pavement below, prayers would rise like smoke toward that void where we place the gods." (Parker, 2001, p. 14, original ellipses)

Hadrian's vision was philosophically sophisticated: spheres both "open," yet "mysteriously enclosed," as well as conventionally religious, from which "prayers would rise like smoke." Yet it recovers from this sanctimony and rises to an Eastern metaphysic, attuned to the dimensionless para-cosmos of the Anaximandrian-Pythagorean *apeiron*: "toward that void," and closes with a conventionally pious genuflection: "where we place the gods." One thing is clear: the Pantheon, in Hadrian's soaring imagination, was to be a place of mystery, of transcendence.

The Pantheon, "dedicated in 125 CE, gave expression to Hadrian's vision that all the gods were manifestations of a singular, but complex energy" (Lambert, 1960, p. 71). Contemporary "Theory of Everything" (TOE) physicists would commend Hadrian's insight and foresight. He was two millennia ahead of his time in a quest for the holy grail of quantum theory: the "Grand Unifying Theory" (GUT) of everything—and nothing.

Hadrian's Contemplative Maritime Theatre

Hadrian's Maritime Theater at Tibur's wall is a 142-foot circle. "Its reflective pools were created, it is said, to observe the star-filled heavens" (Heebner, 2000). Begun in CE 126, Villa Adriana offered Hadrian a refuge. He would often withdraw to this circular house surrounded by a moat to sit in deep contemplation of the star-girt sky.

The central triad of columns, reflected in the still waters of the lunette pool, framed one zodiacal constellation oriented toward the Pole Star round which wheeled the firmament, and—in the constellation of the Eagle—the star he had named in memory of Antinous, beloved member of his entourage. Here, might not Hadrian, in the center of his mirror-pond, as the stars turned about in their course across the night sky, have sought to transcend time that he might recover his youthful ideal?

Hadrian's desire ruled him as he sought the center in the void. Might he have sensed the pulse of Being-Non-being, the passion, the "arc of desire," of the *Creation Veda*, in the star of Antinous shimmering in the dark waters?

> In the Greco-Roman world [Antinous] was ... frequently assimilated with the Hellenic equivalent of *Osiris*, the god Dionysos, who had suffered, died, been reborn and subsequently brought fecundity to the soil. It was with Dionysos that Antinous was to be linked throughout the empire. It was this infusion of oriental energy, mysticism, and transcendence . . . that gave belief in Antinous a deep and wide appeal ... in the second century and later. (Lambert, 1960, p. 188)

Might not Hadrian have envisioned Dionysos' sanctuary as the launch site, at the very center of the Greek cosmos, for a rite of trieteric transcendence bearing Antinous' aspirant spirit to—and beyond—the Great Unknown? Might he not have envisioned his own spirit, in the proper time, joining that of Antinous, borne by the same arrow?

Hadrian attempted to revive the national consciousness of the Greeks by making Delphi the main pan-Hellenic center, but was unsuccessful, due in part to Spartan resistance (Birley, 1997b, pp. 220-221).

Hadrian was, however, given the title of honorary magistrate (*archon*) in Delphi at least twice (Dempsey, 2003/1918, p. 178), and by a declaration naming the days of his visit as an ongoing religious holiday (Birley, 1997a, p. 187). Plutarch erected a statue at Delphi to celebrate Hadrian's ascension to the emperorship of Rome (Birley, 1997a, p. 169).

Emperor Julian: Champion of Free Thought

Emperor Julian's philosophy was, like that of Anaximander, Pythagoras, and the *Vedic* seer of the *Creation Veda* X.129, a philosophy of exaltation. Emperor Julian (1793) in oration to the “Sovereign Sun,” exalts Apollo the sun god, opening his dedication with “The Sun's resplendent deity I sing / The beauteous offspring of almighty Jove” (p. 35). In the oration proper, Julian establishes the universal nature of his insight into Apollo’s power, addressing the oration to all “who breathe or creep on earth,” quoting Zeus from the *Iliad* (p. 39). He noted the sun’s power to divide “the zodiac into twelve powers of god” and connected the god of the sun with the god of wine, noting that Bacchus “is said to obtain a common kingdom with the sun” and completing the thought by noting the unity of the godhead, “But why should I here mention the epithet Horus, or other names of the gods, all of which correspond with the divinity of the sun?” (p. 74). This connection between Apollo and Bacchus recalls Plutarch’s (2006) comment that Dionysus “has no less to do with Delphi than has Apollo.” For Julian, Apollo is central to his existence, having “*generated my soul from eternity, and rendered it an attendant on his divinity*” (p. 92, original emphasis). And he closes with an entirety to “the sun, the king of the universe” to “impart to me a good life; more perfect wisdom; a divine intellect” and a desire to “ascend to his divinity, and abide with him, if possible, in perpetual conjunction” (p. 95).

This invocation has resonances of the cosmic extension of Iamblichus' (2000/1911) treatise, *On the Mysteries of Egypt*, in which he sought to explain the relationship between the divine order and the rites and ceremonies used to influence and affirm that order on earth. Iamblichus discussed the planting of phallic images as “representing of the procreative power by conventional symbols, and that we regard this practice as an invocation to the generative energy of the universe,” which were consecrated in the spring “when all the world is receiving from the gods the prolific force of the whole creation” (chap. 4). The translator, Alexander Wilson, in a footnote claimed “the custom here described was universal in ancient times, and it is still found in parts of India” (note 4). The universality of such a custom supports Iamblichus’s point that “the gods have one common essence” and “comprehending their essential being as divine, they govern the whole sky by one infinite energy” (chap. 4, “The Gods Have One Common Essence” section). Holy rites performed by human beings copy “the order of the gods” and everything is accomplished by a sole Divine Cause, which is so far remote from passive conditions that no reasoning faculty can reach to it (chap. 4, “Classification Rejected” section). He then noted that those “who are unable to acquire the deeper knowledge of the reasonings themselves, yet who imagine themselves able, are entirely carried away by their own peculiar human emotions, and form their judgment of matters relating to the gods from things incident to themselves” (chap. 4, “Classification Rejected” section).

Here, amid a Roman culture about to collapse into sectarian anarchy, rooted in a human tendency to respond to misunderstanding the divine, an ill-omen of the Dark Ages soon to descend on the West, came a call for cosmic transcendence.

Julian's Call to Freedom

As emperor, Julian was a man of his word. On February 4, 362 CE, he shocked the Christian-Roman and "pagan-heathen" world with the issuance of his "Edict of Religious Toleration." In this edict, he extended to all citizens the benefits of religious freedom.

Edward Gibbon (2004), in his classic study, *History of the Decline and Fall of the Roman Empire*, saw the import of Julian's visionary call to freedom. “The only hardship which he inflicted on the Christians, was to deprive them of the power of tormenting their fellow [Roman] subjects, whom they stigmatized with the odious titles of idolaters and heretics” (p. 436).

Gibbon (2004) later presented a prescription for world survival that our planet, given to self-righteous zeal, ignores at its peril in this time of the insidious threat of terror: “Philosophy alone... is able to eradicate from the human mind the latent and deadly principle of fanaticism” (p. 559).

> [These] ancient psychologies had their last official recognition in the waning days of the Roman Empire, before their violent suppression by almost two millennia of monotheistic dogma. But, before Nature philosophy's light was snuffed out, the flame on Delphi's altar burned, if only in spirit, but briefly, under the aegis of the much anathematized visionary Roman emperor, Julian. (Athanassiadi-Fowden, 1981, p. 145)

The Boundless in the Arts

At this point we shift from a focus on nature philosophy to a broader consideration of its inspiration of works of high dramatic art and scientific advancement. The expression of the mystery beyond the Boundless is often found in great works of art. It might be suggested there is a deep connection between the furthest reaches of philosophical thought and works of art that probe the utmost reaches of theoretical speculation. Indeed, this scientific/aesthetic symbiosis would appear to have been the mark of the great age of dramatic art.

For example, Shakespeare's *Hamlet* was being written (in 1600 CE) while the visionary monk, Giordano Bruno, was being immolated on a fiery pyre in Rome's Field of Flowers for proposing a boundless universe in contravention of the narrow dogma of the religious hierarchy. Aesthetics and science meet on common ground in ages of inspired vision. This is borne out by the awakening in the minds of leading contemporary visionaries of science, as evidenced by the soaring spirit of Erwin Schrodinger (1996) in his *Nature and the Greeks:*

> The scientific world-picture vouchsafes a very complete understanding of all that happens—it makes it just a little too understandable. ...[For] the purpose of constructing the picture of the external world, we have ...[cut] our own personality out ...[as] ostensibly not needed. This is reason why the scientific world-view contains of itself no ethical values, no aesthetical values.... Science cannot tell us a word about why music delights up, of why and how an old song can move us to tears. (p. 96)

Greek nature philosophers recognized that psychic ecstasy was essential to the creative process. The Romantic scholar, Goethe (1949/1848), recognized this psychic experience. He wrote in his *Autobiography* of daemonic energies: "A tremendous power issues from them, and they exercise an incredible dominion over all creatures, indeed, even over the elements, and who can say how far such influence will extend.”

This brings to mind the Vedic *parabrahman*, the formless chaos before creation. In original chaos, the cyclic rhythm of life is transcended by the hero when matter emerges from primal chaos—when it is cleaved from the state beyond being, beyond knowing. Such a fusing of oppositional creative and destructive forces is to be found in the dance of the androgynous Hindu god, *Shiva*, fusing "his" male with "his" female power, *Shakti*. In their dance, light and darkness coalesce in a world-creating (and destroying) cosmic shadow play. “The unlike is joined together, and from differences results the most beautiful harmony, and all things take place by strife” (Heraclitus of Ephesus, 2001/1899, part 46).

Contrast such Eastern wholeness with the Western world's *agon* between light and dark, in which the dark is vanquished and ultimately banished by light. This East/West dichotomy was not always so. As we saw in the philosophy of Anaximander and Pythagoras, during the all-too-brief period of pre-Socratic enlightenment, the light of the East penetrated the West.

Transcendent Order in Sophocles' *Oedipus*

The age of Greek high tragedy began within a century of Pythagoras' passing (c. 490 BCE) with the performance of Sophocles' Oedipal trilogy, culminating in his *Oedipus at Colonus* (completed 406 BCE.). Produced in 401 BCE by his grandson after Sophocles death at the age of ninety, *Oedipus at Colonus* was the playwright’s last work and it celebrated the hallowed place of his birth, Colonus. The sacred and transcendental geometric schema of Delphi can be discovered here in the works dramatic form and moving imagery.

Sophocles (1939) has the chorus urge Oedipus to “make expiation to these divinities whose ground you violated when you came” (p. 105). Oedipus asks for clarification of how he should seek this expiation, and the chorus instructs him to “bring libations from the spring” and “Facing the quarter of the morning light, pour your libations out ... in three streams. (p. 106). He is then instructed to “Lay three times nine young shoots of olive on” the spot where the earth soaked up the libations “with both your hands” and repeat the prayer, “That as we call them Eumenides, which means the gentle of heart, may they accept with gentleness the suppliant and his wish” (p. 107).

Recall that 27 (3 x 9) is the ratio of the sun's wheel of fire to the breadth of disc-shaped Earth in Anaximander's first cosmic scheme. Numerologically, 27 (2 + 7) is nine, the fateful penultimate number of Saturn (ruler of time) in Philolaus' Pythagorean Table of Planetary Spheres. Time, according to Anaximander's fragment, governs all (McEvilley, 2002, p. 31) and in the eternal round occupies the penultimate position before completion of the decad (10). Therein, the sphere of stars is transcended, the Boundless, the infinite, *apeiron*, is attained.

Numeric symbolism pervades *Oedipus the King*. In Jocasta's fateful assumption that the Delphic oracle was erroneous, we see that its prophecy points to the fateful number three. She says that Laius was killed “where three roads meet,” and that “before three days were out after” Oedipus’ birth “King Laius pierced his ankles, cast him forth on a pathless hillside” (Sophocles, 1991, p. 41-42).

The following geometric schema, put forward by the chorus in *Oedipus at Colonus,* is most interestingly suggestive of Oedipus' apotheosis and symbolically pins down the four-quarter cross of Nature's fury:

> CHORUS:
> Think of some shore in the north
> Concussive waves make stream
> This way and that in the gales of winter:
> It is like that with him:
> The wild wrack breaking over him
> From head to foot, and coming on forever;
> Now from the plunging down of the sun,
> Now from the sunrise quarter,
> Now from where the noontime gleams,
> Now from the night and the north.
> (Sophocles, 1939, p. 146)

Imagery of waves breaking over Oedipus extend the theme of Nature’s fury in *Oedipus at Colonus*:

> Oedipus to Theseus:
> I'll lead you to the place where I must die;
> But you must never tell it to any man…
> These things are mysteries not to be explained. (p. 158)

O sunlight of no light! Once you were mine!
This is the last my flesh will feel of you;
For now I go to shade my ending day
In the dark underworld.
(Sophocles, 1939, p. 159)

Here, we have the gnosis, or mystic knowledge, at the heart of the mystery of transcendence: in light there is darkness. In the darkness following the blinding light, as Nietzsche (1999) remarked, we see the dark after-image of the sun (p. 46).

This is the secret to tragic *anagnorisis* (discovery, enlightenment, revelation) as seen in *King Lear*, when the dark secret is revealed to the blind Gloucester on the hearth: "I stumbled when I saw" (Shakespeare, 1974, IV.i.19).

Below, Sophocles (1939) in *Oedipus at Colonus* gives full recognition to the inexorable force countering the Mind's limiting reason, and the thrust of Dionysos' transcendent abandon: ecstasy.

MESSENGER:
It was not lightning,
Bearing its fire from Zeus, that took him off;
No hurricane was blowing.
But some attendant from the train of Heaven
Came for him; or else the underworld
Opened in love the unlit door of earth.
For he was taken without lamentation,
Illness or suffering; indeed his end
Was wonderful if mortal's ever was. (p. 163)

Antigone, daughter of Oedipus' incestuous union with Jocasta, explained to the chorus what has become of her father, describing it as a "bewildering mystery" (p. 164):

It was not war
Nor the deep sea that overtook him,
But something invisible and strange
Caught him up—or down—
into a space unseen. (p. 164)

Oedipus, whether conducted to the underworld by an escort sent by the gods or swallowed by a fissure in the earth, transcends the antagonistic forces of the psyche, of very existence. With *Oedipus at Colonus*, morality is transcended in a sublime psychic fusion affecting the hero's apotheosis. The antagonism at the heart of the world—the psychic split in the tension between suffering-restraint and joy-release—is resolved. The cosmic wound, incurred when matter and energy separated from original chaos, is healed. The tragic hero's profound nostalgia is to attain the beyond, the chaos beyond creation—to transcend existence.

This mystic longing has been brought to modern Western attention by an influx of Eastern philosophy. Karl Shapiro (1960) observed this regard in “Cosmic Consciousness:”

> It appears that in the twentieth century we have reached the point at which Oriental “ways of life” are about to penetrate the West. At the same time it appears that science has reached that frontier at which it meets up with what is called mysticism. The deep vein of mysticism has been opened again, and the age of pure rationalism seems to be on the wane. A tremendous synthesis is in the making between modern science [and] the ancient psychologies of the past. (p. 29)

Symbolic Significance of the *Periaktoi* Flanking the Stage at Delphi

Having considered the profound symbolic depth of vision of the great age of Greek high tragedy, let us explore the symbolic significance of the literal stage, on which the tragic vision was physically realized. It is generally believed Anaximander introduced, among other technological advances of the Persians, the *gnomon* (sundial) to Greece, having set one up at Sparta to mark the vernal equinox and the passing of the hours. The Theater of Dionysos at Delphi was both a sundial marking the diurnal round of the sun, and a zodiacal calendar, marking the yearly round of the sun and the firmament. (Figure. 8)

Two *periaktoi* were believed by many theater historians to have flanked the Hellenistic stage, marking changes of scene. However, by carefully considering the etymology of *periaktoi* (from the Greek, *peri* meaning "round" or "beyond; and *aktoi* meaning "rays") we see that rather than being simply a visual aid to help the audience follow the action, the *periaktoi* were markers of "round" of time.

By day, they served as a clock, marking the passage of the sun's rays from sunrise (red dotted line) to high noon (blue dotted line), aiding the priestly morning ritual preparation leading up to the performance of the tragic trilogy and the satyr play afterpiece. By night, they were a zodiacal compass. At midnight, the stage-left *periaktos* lined up for the spirit's flight from the mystic launch site in the center of Sanctuary XXXI.

The *periaktos* lines up along the meridian (blue dotted line) through the fire altar of Hestia in the orchestral center, to the Pole Star, and beyond beyond, transcendentally, to the *apeiron*. Building XXXI, with two sets of steps leading up from it to the theater, was the sanctuary of the god of nature, Dionysos.

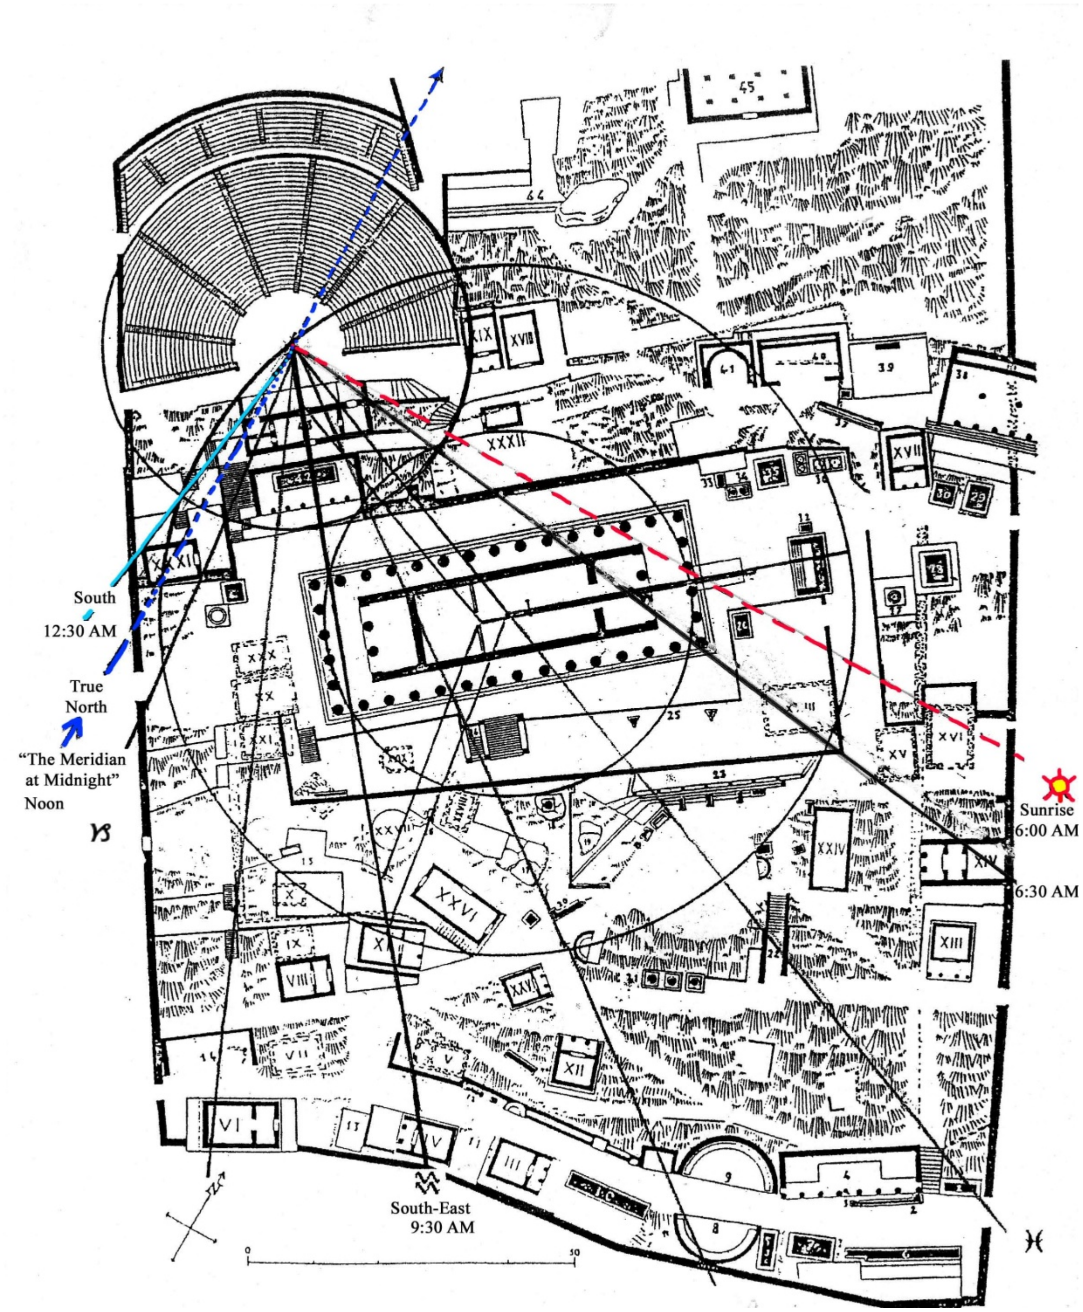


Figure 8. *Periaktos* Lines up Along the Meridian Through the Fire Altar of Hestia ("Themenos of Apollon in Delphi," Coste-Messeliere, 1936, foldout)

At Delphi, the year was quartered when Apollo sojourned in the hyperborean North and Dionysos rejoined his mother, Semele, in the *omphalos* within the temple for the winter quarter. In the same manner, the day was quartered at the vernal equinox, marking the trieteric rite of spring. At this time of renewal, the day was quartered in the Delphic theater of Dionysos, of the god triadically divided in the trieteric rite, within the sacred precincts of Apollo and of Dionysos.

Thus, at high noon, as the hero fell, having retired within to face his fate, the sun was aligned along the meridian running through the center Sanctuary XXXI, the seat of the dying (to be reborn) gods, Dionysos. The sun also aligned with the orchestral center's fire altar of Hestia, goddess of the hearth of the universe, marking the apotheosis of the tragic hero. A half-hour after noon, on the completion of the Dionysian satyr play afterpiece, the *periaktos*' shadow lines up with the western corner of the god of the theater's (Dionysos') Sanctuary XXXI's roof, marking the completion of the satyrs' half-hour comedic revels of renewal.

At the midnight ceremony of the vernal equinox — the soul of the initiate was then borne beyond the dark of night, beyond time, beyond space into the astral firmament.

The Ultimate Tone: The Sound Not Heard

As we draw to a close in this discussion of the Delphic Temple and Theater, it is significant to note the complex has a deflection of 7.5 degrees (light blue line Figure 8) — 1/12th the 90 degree gravitational fall of all existents, the inexorable gravitational angular factor in physics at which a top falls. It is, as well, the gravitational factor in music theory (as in the Pythagorean "Harmony of the Spheres") in the 12-tone scale's octaval fall.

The ultimate placement of the Boundless, *apeiron*, at the pinnacle of the sacred *tetractys* testifies to the trieteric rite's profound reach beyond the empyrean. German musicologist Hans Kayser (1970) was startled to discover in his analysis of the Pythagorean Table of Tones, the ultimate tone is "the sound not heard." This is the sound of silence—the void is from whence all came, and to which all shall return.

In the perennial philosophy of nature, this gravitational descending glissando of all that exists symbolizes the stark imperative of Anaximander's fragment: Each must pay restitution for its existence according to the dictates of time. The revels over, the seed of Dionysos inseminates the womb of Gaia/Earth, first holder of the Delphic seat. The course of Phoebus Apollo above her in summer’s heat is to herald nature’s autumnal bounty. Nature philosophy, though born of tragic awareness, is a philosophy of Emersonian hope, of transcendence, a transcendence the Sage of Concord mystically sensed in creation’s infinite symmetries—and in the ineffable Mystery of Nature emanating from deep within the sacred stones of Delphi.

Yet, Hans Kayser (1970) wrote *Akroasis* with "the note not heard" in the harmony of the spheres, the thirteenth overtonal note commencing the new octave, the spirit mystically attains the apex of the sacred *Tetractys*. And in the trieteric rite, the winnowed seed of infant Dionysos falls to the womb of Gaia/Earth, there mystically to strike the fire of rebirth at the altar of Hestia, "Hearth of the Universe," in the center of the theater of Dionysos. Then, in the mystery beyond knowing, the spirit of the initiate gains release from the wheel of Being, vaulting, transcendently—beyond the Pole Star—beyond the Boundless *apeiron*, "beyond beyond"— in the mystery of *paranada*, which comes from the Sanskrit and conveys a sense of “the soundless sound” beyond creation (“Soundless Sound,” 2008).

Shakespearean Transcendence

When sun, at noon, had aligned along the meridian, Dionysos was in the center of his sanctuary and Hestia was at her central fire of creation altar in the center of the god of ecstatic release's theater orchestra. The day had been quartered, as the year had been quartered in the Delphic temple, Dionysos intimately rejoined his mortal mother, Semele, for the winter quarter within the *omphalos.*

Then, at high noon, beneath Apollo's solar glare, as in the midnight dark of the *Trieterica* rite, as the meridian passed through the center of Dionysos' sanctuary (signaling the fall of Fate's decree on the tragic hero) and the still point in the celestial whirl obscured by the solar disc's blinding glare, and the Boundless *apeiron* rang with the “sound of silence,” the Harmony of the Spheres — at this culminatory moment Oedipus vanished.

In contemplating the heights of high tragedy that realized the transcendent vision, my thoughts naturally turned to the master of tragic form, Shakespeare. Could Shakespeare have been aware of Sophocles' masterwork, *Oedipus at Colonus*? Was it in English translation, and if so, had he access to it? It seems unlikely, but according to John Harvey (1977), it was entirely possible. Yet, might he have sensed, at the climax of Sophocles' *Oedipus at Colonus,* the tragic hero's apotheosis?

The inspired vision of Edouard Schure (1918) pointed the way on this journey into the unknown when he asserted, “Observation and reason are not sufficient. In addition to and above all else is intuition” (p. 114). Pythagoras sought to develop intuition in his students and initiates (p. 49); and intuition was at the root of his efforts to revive the mission of the Delphic priests and bring back the art of divination at Delphi (p. 31, 34). And Pythagoras was successful. According to Meletzis and Papadakis (1964), during his year at Delphi he "revolutionized the art of prophecy" (p. vii).

I felt — there's no explaining how — Delphi's "sound-of-silence" extended somehow beyond our "knowing," infusing our very Being, as had Sophocles' profound tragedy of transcendence. Then, the answer came to me: the answer was to be discovered in that other towering tragic masterwork, *Hamlet*.

The "sound of silence" at the climax of Sophocles' *Oedipus at Colonus* is sensed in the dramatic pause in the opening line of Hamlet's deep-probing soliloquy, “To be, or not to be?” and is sensed as well in the fading sibilance of the final word of his farewell to earthly existence: “The rest is silence” (Shakespeare, 1974, III.i.55, V.ii.358).

This suggests the primal silence of *Creation Veda* X. 129: “Then was neither being, nor non-being.” And well it might, for the soliloquy echoes its form (if not its substance), “To be, or not to be: That is the question” (Shakespeare, 1974, III.i.55). At this point in the action Hamlet is trammeled by "the pale cast of thought," enmeshed in "Words, words, words" (III.i.84, II.ii.192). Horatio's pious benediction at Hamlet' death only contributes more words, “Good night, sweet prince. And flights of angels sing thee to thy rest!” (V.ii.359-360).

An unkind fate had seen to it that Hamlet had long since moved far beyond such pious homilies, “There are more things in heaven and earth, Horatio, than are dreamt of in thy philosophy” (Shakespeare, 1974, I.v.). Our tragic hero has faced the Great Unknown, and accepted Fate's decree, as is clear from his final utterance, “The rest is silence” (V.ii.358). Given

Hamlet's complex nature, it is hard to believe that "rest" is to be taken as an allusion to the sleep of the just, to death's repose, as in Horatio's all-too-conventional resort to a heavenly hereafter. Rather, it would seem to suggest a line from earlier in the play when Hamlet confronts the ghost of his father, "We fools of nature... with thoughts beyond the reaches of our souls" (I.iv.56) are here in an encounter with the spirit's destiny, we are engaged in a mystic transport to, and beyond, the "undiscover'd country"— and to its ineffable silence (III.i.78).

The finding of a kindred transcendence in Oedipus and Hamlet may seem wondrous and strange: Yet, closing *Hamlet* on “silence” suggests a mystical, deep, profound, Sophoclean vision. Upon reflecting on Shakespeare's works, a Sophoclean-Shakespearean connection, tenuous though it may seem, emerges. It appears in, of all places, his frothy satire on philosophic obfuscation, *Love's Labour's Lost*.

The play is a witty bagatelle, as its title suggests. The title is an all too clever alliterative play on the seductively lingual "L," the twelfth letter, numerologically reducible to 3, repeated thrice. Thus we have 3 x 3—*voila!*—the ubiquitous number nine, the fateful number of Anaximander's inexorable controller, time.

Love's Labour's Lost was first performed in the late 1590s, a mere decade after the visionary friar, Giordano Bruno, had sojourned (1583-1585) into the heady intellectual atmosphere of London's Inns of Court. There he had charmed such literary luminaries as Raleigh, Sidney, and Fulke-Greville with his "heretical" philosophy of an infinite cosmos. Such was the ripple he created that it has been proposed by Dorothy Waley Singer (1950) that Shakespeare fashioned the play's witty *raisonneur*, Berowne—an early *Hamlet* if you will—on Bruno (p. 249).

In 1600, between *Love's Labour's Lost* (c. 1595) and *Hamlet* (1601), there transpired an event of cataclysmic moment: Bruno's fiery death for his intransigent philosophy of transcendence. It must have shaken Shakespeare. How could it not? While the reed of connection between Hamlet and Bruno is slender, a reed it is nonetheless. There is more than a trace of Hamlet (and of Pythagoras, as well, for that matter) in Berowne of *Love’s Labour’s Lost*.

Let Dorothea Waley Singer's perceptive biography and the text of *Love's Labour's Lost* make the case. Commenting on Bruno's heroic frenzies, Singer (1950) stated what could be considered the theme of the play: “Bruno exalts the love of philosophy above that of woman” (p. 36)

According to Singer (1950), “The whole of Bruno's philosophy is based on his view of an infinite universe with an infinity of worlds. He conceived the universe as a vast interrelationship throughout space and time, comprehending all phenomena, material and spiritual” (p. 50) For Bruno, wisdom is at the center of this philosophy, she quoted his valedictory address at Wittenberg University, which is a “paean of praise of Wisdom:”

> If all things are in common among friends, the most precious is Wisdom. What can Juno give which thou canst not receive from Wisdom? What mayest thou admire in Venus which thou mayest not also contemplate in Wisdom? Her beauty is not small, for the lord of all things taketh delight in her. Her I have loved and diligently sought from my youth up. (p. 59)

Singer sees Bruno as a kind of a prophet for the changes in the conception of reality later developed by Johannes Kepler and Rene Descartes,

> by which discussion of the nature of material reality yields place to the conception of an Order of the Universe. For Bruno's passionate assertion of the infinity of space was not merely denial of boundary. He conceived Infinite Space as the field of all motion, the vehicle of an Infinite Power which is the expression of the Infinite Life of the Universe. (p. 88)

In this conception of the infinite, Bruno struggled against Aristotle’s arguments against the void, seeing no “distinction between the three infinities of Space, Time and Matter. They merge into one another as does his conception of Infinite Space, Nature and the Infinite World Soul” (p. 89). This “World Soul” for Bruno is “an infinite continuum in which all things partake; yet in another sense discontinuous and divisible and even (on the analogy of number though not with unvarying consistency) infinitely divisible” (p. 91).

The appreciation and understanding of the Boundless, the infinite universe of Bruno’s conception, is far more precious than mere human love, as Bruno noted when he put the love of wisdom above erotic or married love (Venus and Juno) (Singer, 1950, p. 36). This is the *Love's Labour's Lost*’s cosmic premise and its comic purpose. The play opens with Ferdinand, king of Naples, discussing a pact he has made with three scholars to abstain from romantic involvement for three years. One of the scholars, Berowne, resists this condition of the pact, and questions the king.

> Berowne: What is the end of study, let me know.
> King Ferdinand: Why, that to know which we should not know.
> Berowne: Things hid and barr’d (you mean) from common sense?
> King Ferdinand: Ay, that is study’s godlike recompense (I.i.55-58)

Ferdinand here asserts, as Bruno did before him, that contemplation of the mysteries of the universe pays a divine dividend greater than the rewards of erotic love.

The play closes with a reassertion of the need to understand the great mystery at the heart of existence, and the superiority of this understanding to other forms of human knowledge, “The words of Mercury are harsh after the songs of Apollo” (V.ii.930-931).

According to Malcolm Evans (1975), the precise meaning of the line regarding Mercury and Apollo has never been established, but have “Delphic ambiguity,” and “might be expected to bear a more decisive reference to the central thematic considerations of the play itself” (p. 114). “The rhyme of Apollo confronts the reason of Mercury, a faculty ostensibly divorced from the limitations of time, place, and personality, and exposes it for what it is — the instrument of illusion” (p. 118-119). Mercury is linked to writing, and Apollo to “true discourse” greater than that achieved through writing, which Pythagoras had achieved (p. 124). “The Princess and her companions,” who are victorious in the play’s romantic contest, “stand for the Apollonian world of the play” in contradistinction to the Mercurian males (p. 125). The closing “Delphic aphorism” asserts that there is a mystery to the world that must be understood, but it cannot be achieved through conventional book learning (p. 127), an assertion that connects with the premise of this article that Pythagoras encoded a conception of the ineffable in the design of the Temple of Delphi.

Berowne is an Ur-Hamlet, Hamlet, a late Oedipus. A few years later after *Love's Labour's Lost* was first performed, Apollo's aetheric arrow bore the sweet prince's spirit beyond the Pythagorean-Berowneian nine of Saturn, beyond time, beyond the reach of gross matter, beyond the stage of the Globe, beyond the circle of Dionysos' theater. Hamlet became transcendent.

Hamlet's question is the quandary all thoughtful mortals must at some point confront, "To be, or not to be, that is the question." Such are the deep thoughts stirred by the Bard of Avon. They put one in the mind of the profundity found at the very inception of deep speculative thought as framed by Dirghatamas in the opening line of the Vedic Creation Hymn, X. 129: "Then was neither Being, nor Non-being."

Transcendentalism in American Art and Thought

The transcendentalist movement in American philosophy reached its zenith in the 1830s with Emerson's publication of his journal, *The Dial*, the title of which referenced the sundial (Ripley, 184). It may have alluded to the sundial-*periaktos* at Delphi.

Frederic Henry Hedge's (2008/1841) "Questionings" closes, with, "Losing still, that I may find / This bounded self in boundless Mind." This deeply moving transcendental aspiration was to be echoed by Emerson in both his "Nature" essays, where he makes an homage to nature's ability to render infinite variety in the world, "All changes pass without violence, by reason of the two cardinal conditions of boundless space and boundless time" (1903-1904a, p. 179). This boundless infinity calls to Emerson as the standpoint from which to observe and meld with the divine:

> Standing on the bare ground, — my head bathed by the blithe air, and uplifted into infinite space, — all mean egotism vanishes. I become a transparent eye-ball. I am nothing. I see all. The currents of the Universal Being circulate through me; I am part or particle of God. (1903-1904a, p. 109)

Decades before Emerson wrote, Thomas Paine (1884/1794) proved a prescient revolutionary spirit in transcendentalist thinking. He would have free-thinking spirits venturing courageously beyond the limits of space and time that would trammel the imagination. Paine asserted that the ultimate reality of the universe was beyond knowing because not only is

> the power and wisdom He has manifested in the structure of the Creation that I behold is to me incomprehensible, but because even this manifestation, great as it is, is probably but a small display of that immensity of power and wisdom by which millions of other worlds, to me invisible by their distance, were created and continue to exist. (p. 46)

In David Frawley's (1992) more contemporary framing of the age-old challenge:

> It is the archetype of transcendence alone which makes man, which allows us to go beyond the manipulations of our environment to awareness, from which alone true and harmonious action is possible. If we cannot get beyond our conditioning, we are only machines or animals, reflections of our environment, in contradiction and conflict with reflections of different environments. (p. 119)

Frawley (2000) further asserted, "The highest knowing is going beyond knowledge" (p. 128).

Vedic Transcendence and Scientific Theory

Modern physics reveals that all matter originated in, and eventually will return to, energy. Atomic theory envisioned energic action as charged particles schematized in a wave-form pattern. Again, with reference to the transcendent nature of tragedy, this concept seems insufficient: Inherent in wave-form structures is a dualism. Cosmic consciousness transcends all dichotomies of existence — indeed, it transcends existence itself.

> In science today we are witnessing a general shift away from the assumption that the fundamental nature of matter can be considered from the point of view of substance (particles, quanta) to the concept that the fundamental nature of the material world is knowable only through its underlying patterns of wave forms. Therefore, when many ancient cultures chose to examine reality through the metaphors of geometry and music (music being the study of the proportional laws of sound frequency), they were already very close to the position of our most contemporary science. (Lawlor, 1982, p. 4)

On the Significance of Zero at Delphi

> Perhaps no one has embraced nothing as strongly as the Indians who, [Charles] Seife notes [in *Zero: the Biography of a Dangerous Idea*], "never had a fear of the infinite or of the void." Hinduism has embedded within it, a complex philosophy of nothingness, seeing everything in the world as arising from the pregnant void, known as Sunya. (Wertheim, 2001, p. 3)

While the numeric symbol for zero (0) came to the West from the Indian and Arabic cultures almost a millennium after Pythagoras, the *apeiron* — The Boundless — was its equivalent. The sacred *Tetractys*, with its rotary *triskelion*, and its apex in the center of Dionysos' theater orchestra (a place for dancing) brings to mind Anaximander's ethereal whirl impelling the generative "breath" of the cosmos from the void. At the *tetractyl* apex-point, the Central Fire, we see a symbol of origin, 0, as well, the tenth celestial sphere, a symbol of Being in the zodiacal rotation of the stars/constellations.

The altar flame at the center of the Delphic orchestra symbolizes the Pythagorean-Philolaun Central Fire at the point of origin. The periphery beyond the orchestral circle, where the chorus whirled, suggests "the Boundless" *apeiron*. Beyond the spheres of Being and Non-being, the boundless *apeiron* may be seen as symbolic of transcendent release. It is in this light that we, like Edouard Schure, may see the '0' at Delphi as the ouroboros, the serpent endlessly swallowing its tail, endlessly coming to be, then passing away. "The ancients represented the course of the stars, by the winding of a snake; but if this snake was so placed as to have the tail in her mouth, it then represented eternity" (Costa, 2007/1820, p. 4).

The *Vedas* tell us that at time-zero there was no mass-energy in the universe. It was a complete void.

> In the beginning there was no mass-energy in the universe because there was no space. Mass-energy is created due to expansion of the universe. The universe cannot expand without creating mass-energy and universe cannot contract without annihilating mass-energy. Thus the universe started with zero mass energy and will end up with zero mass-energy as well. Thus there was no singularity in the beginning and there will be no singularity at the end (Roy, 1999, p. 205)

Beyond the Zero

> Nature does not know extinction; all it knows is transformation. Everything science has taught me strengthens my belief in the continuity of our spiritual existence after death. (as quoted in Pynchon, 1973, p. 1)

Part I of Thomas Pynchon's *Gravity's Rainbow* is titled "Beyond the Zero." The title of Pynchon's novel refers first to the arc of the V2 rockets launched on London by the German Wehrmacht. The chromatic arc of the rainbow is a source of delight and yet suggests, as Pynchon noticed, the elliptical trajectory of weapons of mass destruction, of annihilation, of zero. *Paranada* goes beyond the positive/negative quandary to the transcendent mystery beyond knowing. In this regard, a kind letter from Shaikh Llewellyn Vaughan-Lea (personal communication, January 28, 2006) of the Golden Sufi Center at Inverness, California confided, "One of the Sufi definitions of God is 'beyond even our idea of beyond.'"

Early Scientific Thought: Nicholas of Cusa and Giordano Bruno

The thought of Nicholas of Cusa, also known as Cusanus, opened the way for the infinite universes of Giordano Bruno. In his essay "Of Learned Ignorance," (1440 CE), modeled after "On the Nature of Things" (c. 55 BCE) by the Roman epicurean Lucretius, Cusanus challenged the limits of ecclesiastical tolerance. He showed a prevision of the micro/macro-cosmos that modern science is currently exploring, a cosmos of atoms in an infinite void endlessly forming, dissolving, and forming matter. As the outcome of his ardent meditations on the Deity, Nicholas of Cusa (1954) was gifted with a paradoxical vision of a universe whose "center is everywhere; its periphery, nowhere" (book 2, chapter 12).

In the late 1500s, yet another wearer of the cloth, Giordano Bruno, had a caring concept: the universe is infinite. According to Brooke (1991), Giordano Bruno, who was attracted to both the atomic theories of antiquity and to Cusanus' reasoning, became "an advocate of Copernican astronomy, of an infinite universe, and a plurality of worlds...[a position then] considered heretical" (p. 39).

Bruno gave impassioned expression to his vision in On the Infinite Universe and Worlds' "Introductory Epistle," wherein he identified Apollo with the Sun:

> With whose blood [the Python] he [Apollo] hath dyed the waters of the sea,
> Hath put to flight the Fury that pursued me.
> To thee I turn, I soar, O my sustaining Voice;
> I render thanks to thee, my Sun, my divine Light.
> (quoted in Singer, 1959, p. 248)

According to Singer (1959) Bruno ascended "to heights of mystic exaltation in the apprehension of an Infinite universe" (p. 3). Singer asserted that Bruno understood the limitations of the human mind, but put forward the idea that the humankind could still "yield an apprehension of beauty, of symmetry, of Mind without end" (p. 3).

Bruno felt superior to Copernicus, for whereas Copernicus understood his theory as a mathematician, "Bruno claimed he could interpret the Copernican celestial diagram as a hieroglyph of divine mysteries" (Eliade, 1976, p. 57). The vision at the heart of Bruno's major work: "All life, indeed all Being, he regards as an expression . . . of Immanent Necessity" (Singer, 1959, p. 87).

Hawkins (1983) in *Mindsteps to the Cosmos* describes Bruno's discoveries. Bruno "had written about the boundless size of the cosmos and the immortality of the human soul. He proposed that there might be an infinity of worlds" (p. 218). The good Friar's punishment for his heterodoxy? Burning at the stake. Hawkins noted, "Ten years after the burning, [Galileo] saw through his new telescope what no one had seen before: an infinity of stars" (p. 219). Galileo's infinity was Bruno's infinity. According to Hawkins, "Bruno said the field of stars was 3-dimensional and stretched to infinity, and beyond infinity was another infinity. ... unseen" (p. 277).

This is a vision of a god who, in Paul Davies (1981) words, though not specifically addressing Bruno's vision, is "not part of the stunning beauty contained in nature's mathematical laws;" only such a god "that transcends space-time, that is above causality and manipulation, can have any real relevance for the natural activity that blazes all around us" (p. 171).

Transcendent Consciousness and Quantum Theory

Most modern speculation or theories about time and space are on a par with those of the ancient Hindus. Time is merely a sequence of events with no beginning or ending. The material universe extends beyond the greatest distances we can observe by optical or radio means. It is boundless. In 1982, "Alexander Vilekin proposed the universe was created by quantum processes starting from 'literally nothing' meaning not only the absence of matter, but the absence of space and time as well, in the totally empty geometry" (Pandian, 2003).

On the other hand, the Big Bang singularity theory is time-bound. According to Ramesh N. Rao (2004), the Big Bang model "proposes that the mass-energy before the universe came into being was concentrated at a single point. The Vedas instead tell us that in the beginning there was no mass-energy. It was a complete void." Rao quoted Subhash Kak's foreword to Raja Ram Mohan Roy's (1999) *Vedic Physics, Scientific Origins of Hinduism* to further this point, "In quantum mechanics the state changes in an abrupt fashion when an observation is made, and this has prompted some physicists to claim consciousness should be the primary category of the universe, distinct from physical matter" (p. xiv).

In support of the primacy of consciousness in quantum theory, Amit Goswami contended that "consciousness is the ground of all being" (Hamilton, 2007, part 1). Goswami (1989) developed an idealistic interpretation of quantum mechanics "supported by the ancient East Indian philosophy of Advaita Vedanta, which states that materiality is manifested from consciousness" (Swift, 2000, note 3).

In 1998, in "The Great Debate: Cosmology Solved?" at the Smithsonian, Michael S. Turner (1999) of Fermilab stated, "Quantum fluctuations seeded all the structure in the universe" (p. 1). Might this not be taken as saying all is energy, all is rhythm, reminiscent of the "coming to be and passing away" found in Anaximander's fragment? (cited in Classen, 1977, p. 92). Can we conceive of existence beginning not with a bang, but mystically, being in a para-state, an unfathomable mystery? In the Pythagorean "theory of the breathing universe … the evolution of the cosmos starts with a primordial unity, which is opposed to an undetermined Void" (Sinnige, 1968, p. 59).

In this endless, beginningless rhythm of Being and Non-Being to the nth degree, who or what gave the downbeat to the "sound not heard" which Hans Kayser (1970) found to be the para-ultimate soundless sound in the Pythagorean table of tones? Many physicists believe nothingness is the basis of everything. "Indeed, it might be said that one way of characterizing the history of modern physics is the gradual rise in the status of nothing from anathema to supreme principle" (Wertheim, 2001, p. 1). As Quentin Smith (1993) put it, "We should instead acknowledge our foundation in nothingness and feel awe at the marvelous fact that we have a chance to participate briefly in this incredible sunburst that interrupts without reason the reign of non-being" (p. 135).

Quantum's Leap Into the Microcosm

Late in my ruminations on the mystery of spiritual renewal in nature, I was skimming through the website of the University of Pittsburgh's Physics Department. The university housed the editorial office of *Theatre Survey*, a journal where one of my articles, "The Symmetry of Delphi" was published in 1971. On the Physics Department site (which has since been changed), I happened across the image of the *Tectractys*. It was not the familiar planar two-dimensional *Tetractys.* It was in 3-D, and it was not the earth-bound planar diagram that conventionally plots the ten Pythagorean *tetractyl* points. Rather, it was a tetrahedron, a "solid" form, with Pythagoras' ten spheres/planets as its base. There was wonder beyond its form — its context. Its thrust was not out toward and beyond the stars; the thrust of its Apollonian arrow was in, toward the subatomic zero-point.

The image comes from Particle Data Group's Review of Particle Properties and has been reproduced by University of Pittsburg physics professor Eric Swanson (2003) in an article titled, "Constructing the Universe: The Particle Explosion." The lowest plane in this figure is of particular interest for us.

Figure 9. Particle Families (Swanson, 2003, p. 6)

In July 1962 at the 11th International Conference on High-Energy Physics at the European Organization for Nuclear Research (CERN), during a talk on the strong interactions of strange particles, the discovery of the two particles labeled "xi-" and "xi0" was announced. Physicists Murray Gell-Mann and Yuval Ne'eman were in the audience and both realized that the lower plane was being filled out according to their expectations, only the last particle, the omega, was missing. Both raised their hands, and Gell-Mann, as the more prominent physicist, was called upon. At the podium, he announced that a new particle must exist, which he called the omega-minus. Two years later it was discovered at Brookhaven National Laboratory.

Pythagoras might have nodded approvingly, or perhaps shaken his head, to have his most sacrosanct icon thus exposed to those not apprised of its arcane significance. He may have felt the perpetrators of such revelation of the sacred schema, on which the initiates swore their most solemn oath of secrecy, must pay dearly for such an indiscretion. Is modern science tempting Fate? Or, alternatively, will such a visionary insight guide modern science in its probing for the key to the mystery of One and the None?

"Ancient geometry begins with One, while modern mathematics and geometry begin with Zero" (Lawlor, 1982, p. 16). Yet Pythagoras' mystic plotting of celestial spheres also began with zero, the Central Fire of origin, at the *Tetractyl* apex. And, in its plotting of the *decad* of planetary spheres, zero culminated in a return to the apex, and its spiritual arrow-flight beyond the *apeiron*.

The Omega Point:

Life is a constant at the omega point.

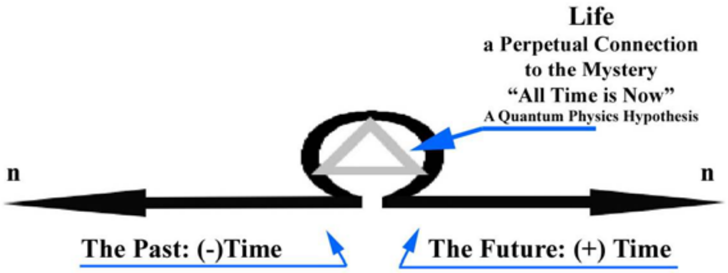

Figure 10. The Omega Point (© Hector Currie and Juan Pacheco 2007)

The omega point at the apex of Gell-Mann's and Ne'eman's three-dimensional *tetractys* is the inspiration for the graphic design of co-author Juan Pacheco above. This symbol of transcendence, at the apex of Pythagoras' sacred *Tetractys*, encapsulates Delphi's mystic power. This symbol, it is our contention, illustrates what Benjamin Libet serendipitously stumbled upon in his 1970's experiments attempting to measure the impulse of a simultaneous reaction (McCrone, 2006).

Given that a simultaneous reaction is (according to the laws of physics) impossible, Libet was amazed to find the simultaneous reaction was, in fact, simultaneous.

One is put in mind of the Delphic injunction, "Know thyself." Mystically, might knowing oneself not come down to a mysterious deepening of the apparent meaning of Dephi's gnomic utterance? On sober (and, at times, giddy) reflection, it might come down to, "Know that thou art the mystery, and possess within thee the secret to the Cosmos."

This is the secret Eugene O'Neill (2002) revealed to us in his tragic masterpiece, *Long Day's Journey into Night* in Edmund's moving monologue,

> And several other times in my life, when I was swimming far out, or lying alone on the beach, I have had the same experience. Became the sun, the hot sand, green seaweed anchored to a rock, swaying in the tide. Like a saint's vision of beatitude. Like the veil of things as they seem drawn back by an unseen hand. For a second you see — and seeing the secret, are the secret. (p. 156)

On the Boundless Frontier of Science's Limits

Current scientific thought holds that space cannot be indefinitely divided. "Most physicists suspect there is a granularity on a scale of scale of 10^{33} centimetres. This is twenty powers of ten smaller than an atomic nucleus. ... If there were still tinier structures, they would transcend our concepts of space and time" (Rees, 1999, p. 12). Yet this is precisely what Anaximander and Pythagoras did, and, before them, Dirghatamas.

Cosmic Consciousness

> Cosmic consciousness bestows a bliss that is past all words to describe and it also quickens the sympathies and attunes the soul to the vibrations of the heart-cries of the struggling evolving ones who are still travailing in the pains of the new birth. We must be willing to endure the suffering *in order that we may realize the joy*; not because joy is the reward for suffering, but because it is only by losing sight of the personal self that we become aware of that inner Self which is immortal and blissful; and when we become aware of the reality of that inner Self, we know that we are united with *the all*, and must feel with all. (Nomad, 2007, p. 175; original emphasis)

While definitions for and articles about cosmic consciousness permeate cyberspace, only a passing mention in this "Digital Age" is given to cybernetic binary bits, of the "zero – one – zero – one" sequence of energy-entropy, of one-none, *ad infinitum*. This brings us back to the remarkable insight of the "obscure," in more ways than one, anonymous12th-century monk who inscribed this mind-searing, metaphysical vision in *The Salem Codex*: “Every number arises from One, and this in turn from the Zero. In this lies a great and sacred mystery” (quoted in Kaplan, 1999, p. 207).

Beyond Knowing: The Call for Transcendence and Tolerance

A connection to the Great Mystery Beyond is a concept that the West has, over the years, embraced but sporadically. The general consensus in the West has been that ours is a material universe, and the heavenly hereafter is our avenue of escape from its mortal coils.

We — each of us, individual (from the Latin, *in-dividuus*, undivided, one), one in selfhood — are inculcated to see a state of unmanifest immateriality as counter to the basic human instinct for personal survival. Our apparent physical singularity impels us to seek refuge in the bond of family, community, and faith in a protective deity. Few have the courage to resist this impulse to seek refuge in submission to a providential authority. Those who do are adjudged heretical and suffer ostracism or calumniation.

Pythagoreanism was born in the axial age, when the venturesome turned from abasement before the gods to an assertion of intellectual freedom. In breaking free of the herd mentality, Pythagoreans were the Tom Paines of their day, “accusing religion of being the source of dogmatism, fanaticism, prejudice, ignorance, repression, and persecution” (Martin, 1997, p. 4).

As lone voices, they, like Paine, paid a heavy price for their convictions. With the triumph of authoritarian materialism in the Hellenistic and Roman cultures, their esoteric secret was lost, or more precisely, buried. The age-old impulse to submit to a greater power triumphed; man had resorted to religion (from the Latin, *religare,* bind together). With conviction in the superiority of one's belief system arose the specter of religious fanaticism. The age of religious/political wars

— already familiar in the classic Greek world where there been at least three "holy" wars to wrest control of the oracle — was upon us.

Religious Fervour and Rancour

Throughout human history, religious zeal has all too frequently been channeled into violent conflict, barbaric cruelty. All too often religious organizations promote hatred, war and arrogance. Still, "new" movements arise, again and again, many of which "emphasize the importance of mysticism and quiet inner exploration, as opposed to evangelical fervor" (Davies, 1983, p. 4).

John Michell (1988), in the closing of *The Dimensions of Paradise,* calls for a "structured harmony," for world concord (p. 213). Pythagorean harmony extended beyond worldly concord. Rather than a dualistic moral judgment, Delphic rites sought a dynamic equipoise between Apollonian and Dionysian psychic forces, transcending the Self/Boundless dichotomy. “The East takes the cosmos as the starting point. … the West emphasizes sin, and the gulf that has to be bridged between God and humans” (Borchert, 1994, p. 95).

But the answer to the Great Mystery cannot be found in religious dogma or fanaticism. Rather, we must turn to the solace of silence. Silence gives a caesura to the surge of sound, it is a breathless cosmic Grace. As the Creation Veda X.129 professed, confounding reason, "the breathless breathed breathlessly." Jamie James (1993) in *The Music of the Spheres* asserted that “the key is to find one's center outside one's self, in the whole cosmos, paradoxically to become centerless; and that, it would seem, is the very last thing that mankind is now capable of” and concluded, “Yet now that science permits us to actually hear the soundtrack of the cosmos, in the form of random blips and howls picked up by radio telescopes, how we long for silence” (p. 240-241, 241).

The Synchronicity of It All

“Synchronicity suggests that mind and matter, along with past, present and future, exist in a potentially meaningful continuum. As such, it compels us to rethink everyday assumptions about self and environment, causality and time” (Clark, 2008). Carl Gustav Jung held that “synchronicity involves an acausal relationship between ego consciousness and the other environment. That is, synchronicity just happens, [it is] not caused by any single event” (Clark, 2008).

There is an ongoing debate over when life begins. “The Native American attitude is that everything is animated by divinity [has a Spirit/is connected to the Mystery]. Hence ordinary people, animals and places are divine” (Eddy, 2001). That is, they have consciousness and are cognizant. The synchronicity of this is manifested in the quantum double-split experiment, and also the observer experiment, in which electron particles change their behavior when viewed by an observer. As Dr. Fred Alan Wolf, a.k.a. Dr. Quantum, put it, “the electron decided to act differently as if it was aware it was being watched,” which seems to imply cognizance on the part of the particle (quoted in Arntz, Chasse, & Hoffman, 2006).

At conception, cells undergo rapid growth and change as they develop into being. But the being is not attained until the being achieves self-awareness as in: I am/ego/spirit/yin; I want/ambition/materialism/survival/yang. The balance is life, synchronistic with the connection to the Mystery that "Thou art the Mystery."

On Intuition as *The* Key to *The* Secret

Intuition guided Kant to his discovery that transcendentalism was the key to opening the spirit to the wonder which inspired the ancients. Emerson’s (1903-1904a) rapturous connection with nature moved him to a transcendent vision: “All mean egotism vanishes. I become a transparent eye-ball; I am nothing; I see all; the currents of the Universal Being circulate through me” (p. 109).

Elsewhere, in the other essay titled “Nature,” Emerson (1903-1904b) moved beyond the immediate and expresses what appears to be a recension of Anaximander's breakthrough concept of the Boundless *apeiron:* “Efficient Nature, *Natura naturans* … publishes itself … through transformation on transformation to the highest symmetries … All changes pass without violence by mean of boundless space and boundless time” (p. 179).

Synchronicity in Transcending Time

Time present and time past
Are both perhaps present in time future.
And time future contained in time past.
If all time is eternally present
All time is unredeemable.
(Elliot, 2008a)

This passage from Elliot’s “Burnt Norton” quartet exemplifies the schemata inherent within synchronicity. The future carrying the past as an expectant mother carries the child within the womb.

Deciphering the archetypal schemata around us is to interpret the synchronicity of it all, in the fleeting moment that encompasses all time, and becomes all things, and beyond all things.

We shall not cease from exploration
And the end of all our exploring
Will be to arrive where we started
And know the place for the first time.
Through the unknown, unremembered gate
When the last of earth left to discover
Is that which was the beginning;
At the source of the longest river
The voice of the hidden waterfall
And the children in the apple-tree
Not known, because not looked for

But heard, half-heard, in the stillness
Between two waves of the sea.
Quick now, here, now, always—
A condition of complete simplicity
(Costing not less than everything)
And all shall be well and
All manner of thing shall be well
When the tongues of flame are in-folded
Into the crowned knot of fire
And the fire and the rose are one.
(Elliot, 2008b)

Synchronicity and the End (Beginning)

It has been a long journey back to our lost roots in ancient India and Greece. Its inspirators have been a quadrivium of visionaries: Dirghatamas, Anaximander, Pythagoras; and at the center of this mystic triad, Pherecydes, who brought the wisdom of the East to Greece and who inspired the Pythagorean doctrine of reincarnation (Knight, 1958, p. 230).

The image of Pherecydes levitating, an illustration of a Johannes Amos Comenius woodcut from his epochal publication of *Orbis Pictus* (1658) appears to have an ouroboran serpentine coil framing the sage: dark scales sinister, light scales, dexter. Legend tells of Pythagoras performing phenomenal feat of bilocation, levitating at both Croton and Metaontum. Likewise, Pherecydes is pictured here, apparently ascending into the boundless *apeiron.* These legendary feats point to the thrust of *Paranada* — loss of selfhood in a mystery beyond knowing, and the recovery of the secret lost (or rather suppressed) for two millennia.

As can be seen in the picture below (Figure 11), Pherecydes is levitating, framed by what appears to be an ouroboros, a serpent about to swallow its tail, the dark scale-like etching and the very faint almost imaginative head off the right shoulder, swallowing the light but still faint scale-like etching of a tail.

This illustration of Pherecydes was rendered in a woodcut by John Amos Comenius (1592-1670), the same artist who created the representation of Pythagoras meditating by his astrolabe (final illustration). Comenius is known as the father of modern education, and was a theologian as well as an educator. Comenius was the first to create illustrated texts for children (and adults who delight in imaginative approaches to the world around and within us). He was a tragic figure, a Moravian without a country, who spent his peregrinous life darting from country to country in Europe's seemingly endless sectarian wars. His *Labyrinth of the World and Paradise of the Heart* was a *Pilgrim's Progress* half a century before Bunyon and beings to mind the key lines of the *Vedic Creation hymn X*. 129: “Sages, searching in their hearts, with wisdom found the bond between being and non-being.”

Today, the Comenius Medal is a prestigious award of UNESCO, honoring high achievement in education. Comenius' lofty pedagogic goal was to lead the way on what he termed the *Via*

Lucis (The Way of the Light). Such high idealism led Harvard, in 1640, to offer Comenius the honor of being its first president.

Surely it appears he was sending a message of love and transcendence when he wrote on the subject of the mystic and pre-Socratic philosophers.

Here, at the mouth of the ouroboros we come to the dizzying end/beginning of this work. There is more than is dreamed of in the Nature philosophy our all too-materialistic world forgot after the flame of Delphi burned no more. We find ourselves back at the birth of universal innocence, of all that is defined in the word *agape*.

Huston Smith and Jeffrey Mishlove discuss this concept in “The Primordial Tradition” an episode of *Thinking Allowed, Conversations On the Leading Edge of Knowledge and Discovery*, which ran on PBS.

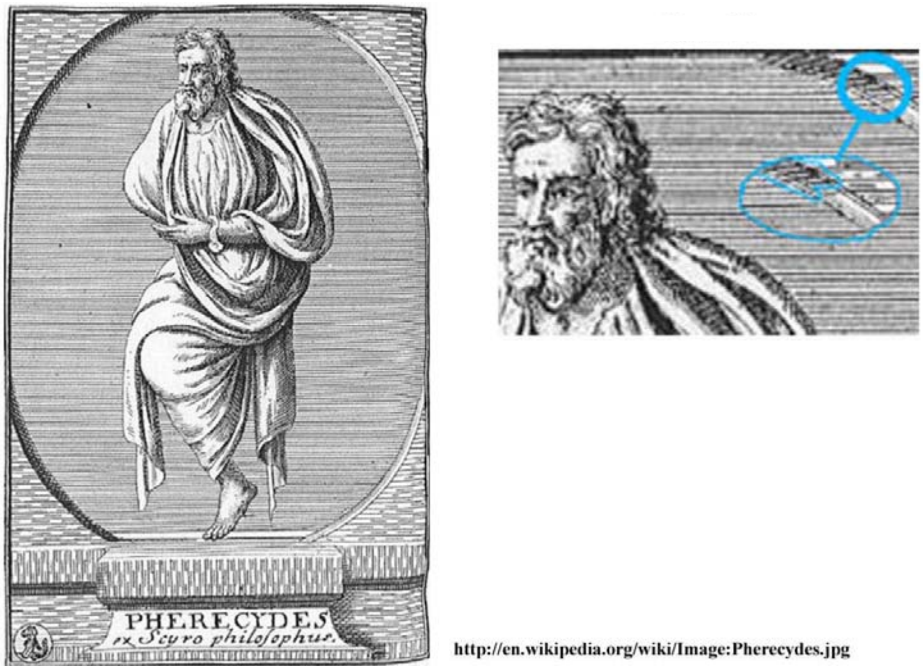
> MISHLOVE: That's true. That universe, the space-time world, fits into the primordial tradition but does not exhaust it. There are reaches beyond the physical.
>
> SMITH: To the divine and the infinite. I think that's true. I think that the soul is at one and the same time the final locus of our individuality. It is what makes you, Jeffrey Mishlove, unlike any other person who ever has been or will be, and yet is constant with you throughout your career. That's one thing, but it also has a tropism, a kind of dynamism in it, in which it is forever reaching beyond anything you have ever attained thus far, and it will never stop that reaching until, we're told, it finally loses its individuality by merging with the infinite.
>
> MISHLOVE: That seems to be a good ending point, in a sense to realize where we end is where we start.
> (Mishlove, 1996)

This has been a long journey — and a sad one. It has been a journey marked by a deep sense of loss. For the world, in its embrace of material substantiality, worldly matter and matters, has been seemingly oblivious to Pythagoras' searing vision of an unbounded, transcendent cosmos of ever-renewing energies. Yet, it is the hope of the author of this essay on the unapproachable mystery, that the world might awaken to Pythagoras' dream and see that for which his soul ached — the eternal return, the return to the point-beyond-knowing, to the beyond beyond-sensing.

"The most beautiful thing we can experience is the mysterious." (Einstein, 1994)

> Divided, into East and West, the world stands in desperate need of the transcendent vision of Dirghatamas, who 'saw' far, far, beyond the light, beyond the darkness of *Creation Veda* X. 129:
>
> Then was neither Being nor Non-being....
> darkness wrapt in darkness....
> The breathless breathed breathlessly....

Sages searching in their hearts, with wisdom,
Found the bond between Being and Non-Being.



http://en.wikipedia.org/wiki/Image:Pherecydes.jpg

Figure 11. Pherecydes (“Pherecydes ex Scyro Philosophus,” Geldsetzer, 2001)

Postlude

“Paranada: Beyond Beyond” has been a repressed obsession of mine for well over fifty years. In its many by-ways of the spirit, my journey has been Nietzschean. It all came to a head back in 1952, while making a promotional film for St. Mary's College, Moraga, home of the Galloping Gaels. One bright spring morning, before starting the shoot, I happened to be in the library with the good Brothers, and asked, "What's the Church's view of zero?" A day later the answer came down from on high: "It is the Devil – Satan."

My jaw dropped, having expected the response would have involved an appreciation of the mystery of creation. Might it not have reflected a dark Nietzschean awareness of the shadow, the black sun after-image one senses after a quick glance at the sun?

Now, on having finally (at least for now) settled on the final draft, I know that the reader, like my idol, Jean-Luc Godard, whose habit is first to read the last passage of a book — any book — may well be wondering "What is *Paranada's* ‘Big Idea’? Where does it end up?"

Quite simply, it is to stress the discovery, that is to say rediscovery, of what Huxley (2004) called the "perennial philosophy" of the East in Pythagoras' plot, his cosmic plan, of Delphi.

In effect, I found spiritual liberation in Delphi's rite of spring, in the mind of Apollo, and in the ecstatic heart of Dionysos.

After everything has been said and done, the key to it all may be there is neither key, nor lock, nor door, nor jamb, at the mystic threshold. One need not utter "Open." One need only ecstatically sense The Mystery.

As Strohmeier and Westbrook (1999) sagely suggest in *Divine Harmony: The Life and Teachings of Pythagoras*: “The challenge of our time may be to revive it, and make divine harmony ‘the great theme’ of the next millennium” (Epilogue).

Editorial

Integral Review (IR) continues to grow and evolve. For one thing we have begun to share the Editorial role among the Associate Editors, and Jonathan has handed to me (Tom Murray) the enjoyable task of welcoming you to our December 2009 issue. In this issue we are pleased to see, in addition to articles on a broad range of topics that I will describe below, a significant number of responses to Stein and Heikkinen's article in our June 2009 issue. I will present an extended overview of those responses and briefly discuss some of the threads they cover. First, I will begin with some news and announcements.

We would like to welcome two new members to our Editorial Board: Jennifer Gidley and Steve Wallis. Jennifer has previously published her work on evolving planetary consciousness with IR, and her extended article continues to be one of our most frequently downloaded. Steve Wallis has also published with us, and has also taken the initiative to edit, along with IR Editorial Board member Mark Edwards, a special issue of IR on *Developing Perspectives for Advancing Metatheory and Theory*. Prior to that, we will publish a special issue on *Toward Developing Politics and the Political,* edited by IR Associate Editors Sara Ross and Thomas Jordan. Later will be another, *Research Across Boundaries – Advances in Theory-building*, guest-edited by Markus Molz and Mark Edwards. If you want to propose a special issue for *Integral Review* you can inquire at ireditors@integral-review.org.

Many of us associated with *Integral Review* are looking toward the Integral Theory Conference next year at JFK University, and have submitted proposals. We also have plans in the works to host a gathering for friends of IR at or prior to the conference—we'll let you know through our *Occasional Newsletter* distributed to those who join IR's mailing list at http://integral-review.org/email_issue/index.asp.

In other news, IR has been picked up by EBSCO, the largest supplier of online journals to academic institutions around the world. IR is now listed in its humanities database, and we welcome the additional exposure this provides for a broader range of academic researchers to access works published in IR. We will be applying for listing in EBSCO's social sciences database in 2010, as well as the American Psychological Association's psycINFO database.

We have reviewed our submissions deadline policy in light of a number of factors and have now instituted a rolling submissions schedule. Thus submissions are accepted at any time, and are published in the issue following completion of review and any revisions. This reflects the reality that each submission requires individual treatment in terms of the time and effort it requires to reach publication, and it gives us more flexibility in organizing our editorial processes.

Looking to future issues and following from the themes explored in this issue, we are particularly inviting papers that further explore the themes of assessment of adult development and the application of integrally-informed models for organizational and leadership change and transformation.

SOME RIGHTS RESERVED

In This Issue…

As usual, this issue features articles on a wide range of leading edge interdisciplinary topics covering the theory-to-practice spectrum. Several submissions are in response to Stein & Heikkinen's paper on *Models, Metrics, and Measurement in Developmental Psychology* in the June 2009 issue of Integral Review. I will report on these in the succeeding section.

The section of peer reviewed articles in this issue begins with *The Coherent Heart*, in which Rollin McCraty and colleagues share a detailed report of a wide range of fascinating research studies during the last decade that show how emotion and the physiological state of the heart interacts with numerous physical and psychological systems. They show how coherence in heart rhythm and harmonious synchronization in heart-brain interactions are associated with positive emotions and significantly impact a number of indicators of well-being. They work with the Institute of HeartMath, which has developed contemplative activities for the practice of sustained positive emotion that induce heart rhythms related to health and well-being. The research uses dynamic systems theory and looks at both neurocardiological data and the heart's generation of electromagnetic fields.

In *The Ethics of Promoting and Assigning Adult Developmental Exercises: A Critical Analysis of the Immunity to Change Process*, Sofia Kjellström shares her experiences of using Kegan and Lahey's Immunity to Change Process in higher education. This process is usually used in organizational contexts to help participants uncover unexamined or unconscious assumptions that prevent them from reaching important goals and commitments. It requires participants to reflect in deep and vulnerable ways upon disparities between intention and action. Kjellström discusses a number of limitations and ethical issues that arise in trying to use the method in educational contexts and in so doing introduces her perception of hidden assumptions of the Immunity to Change model itself. She examines the possible mismatch between organizational contexts and classroom contexts in terms of the desire to change and reflect upon oneself, commitment to the change process, trust among those engaged in the process, and the developmental level required to use the process. The results are of interest to all who facilitate the process, and those who value giving students authentic, engaged, and/or transformative experiences in the classroom, but must grapple with the fact that school has critical differences with real life contexts such as work and family.

Our third peer reviewed article is Bill Torbert and Reut Livne-Tarandach's *Reliability and Validity Tests of the Harthill Leadership Development Profile in the Context of Developmental Action Inquiry Theory, Practice and Method.* This is a response to Stein & Heikkinen's paper, and is summarized with the other responses later.

The editorially reviewed section of this issue begins with *Toward Integral Higher Education Study Programs in the European Higher Education Area: A Programmatic and Strategic View*, in which Markus Molz reviews the state of higher education in the EU, looking at trends and imagining possible futures. He sets the historical, pedagogical, and institutional context for attempts at bringing integral approaches to higher education, and argues for the critical importance of such approaches, despite the only moderate and often ungainly attempts to date.

His analysis of why it has been so difficult to create sustained integral programs leads into a series of recommendations for future attempts.

In *Consciousness in Evolution Sketch for a New Model – A Speculation* Donald Padelford takes us on an informal yet in-depth tour of his "Twenty Tenets of an New Model of Evolution." Ken Wilber proposed an earlier, different set of Twenty Tenets in *Sex, Ecology, Spirituality,* but Padelford introduces his own insights and includes references to more recent work in the field. He brings a unique voice to the oft-pondered relationships between mind, matter, hierarchy, development, consciousness, causality, and interiority. His analysis is based in part on the construct of hierarchical negentropic systems.

R. Scott Pochron's *A Leadership Journey: Personal Reflections from the School of Hard Knocks* is a reflection upon the lessons learned in many years of leadership in diverse organizations. His themes include "organization as organism," "leading as enacting an emerging future," "disequilibrium," and "leadership as a state of mind." Along the way, he draws stories and principles from leadership and organization change authors including Quinn, Jaques, and Senge.

Russ Volckmann graces our pages with another engrossing interview. In this issue he speaks with Alfonso Montuori, Chair and Professor of the Transformative Studies Ph.D. and Transformative Leadership Master’s program at the California Institute of Integral Studies, and IR Editorial Board member, on the themes of creativity and transdisciplinarity. These themes emerge and resurface as Montuori discusses his stint as a professional saxophone player in England, his involvement with the Monterey Institute of International Studies, his teaching in China, and his work editing the *World Futures* Journal, taking us on an international tour of the places he has lived and worked. It is a paradigmatic yet idiosyncratic ride through the cultural shifts in this age of Aquarius, and a conceptual voyage through theories of everything, general theories of leadership, metatheory, epistemology and complexity, disciplinary promiscuity, and "liquid life." In his interview Volckmann helps reveal that life of "creativity…as a way of being" with each movement echoing "the sound of surprise."

Editorial Board member Roland Benedikter reviews John Holman's book, T*he Return of the Perennial Philosophy: The Supreme Vision of Western Esotericism.* While he appreciates its treatment of trends in exploratory first person "empirical spirituality" vs. traditional faith-based spirituality, overall he finds the book to be "an interesting but incomplete contribution," in part due to the author's inability to take enough of an objective and non-promotional distance from his subject.

Responses to Models, Metrics, and Measurement in Developmental Psychology

In our June 2009 issue we published an article by Zak Stein and Katie Heikkinen titled *Models, Metrics, and Measurement in Developmental Psychology*. When we first spoke with Zak about publishing a paper on this topic we were aware that it could serve as a lightning rod for vigorous debate, and saw this as an opportunity to plan for our first article-response-rejoinder format crossing multiple issues of IR. The obfuscated lines between research and the marketplace, problematic in so many academic fields, show up vividly in developmental psychology, where developmental assessments are being used increasingly to evaluate development of individuals in domains including leadership/management, therapy, and academic programs.

Through various channels, we invited responses from theorists and practitioners, and are pleased to publish in this issue a number of responses, including submissions from Bill Torbert, Michael Commons, Theo Dawson, Michael Basseches, the principals at Ikan, myself, and separate rejoinder articles from Stein and Heikkinen. Stein and Heikkinen's earlier article had also inspired Bill Torbert to host a face to face meeting of developmental practitioners and theorists. Terri O'Fallon reported her reflections on that meeting in the October issue of *Integral Leadership Review,* (linked in the Table of Contents for this section), and we publish a transcript of that meeting's closing conversation, which gives a flavor of the day-long meeting.

Summary of Key Elements of the Original Article

In *Models, Metrics, and Measurement,* Stein and Heikkinen introduce a framework and terminology aimed at supporting more rigor in developmental models and metrics (Figure 1 in the paper). They differentiate "soft metrics" from "calibrated metrics" with the latter having more stringent "reliability and validity profiles." They also propose that every metric we use for developmental assessment or research should have reliability and validity profiles associated with it. "If we want to see an integral and developmental worldview gain a real institutional foothold—radically reforming business, government, education, therapy, and our own sense of human potentials—we need to get serious about our quality control standards" (p. 19).[1]

Central to Stein and Heikkinen's 2009 paper is a strong proposition that only *calibrated* metrics are appropriate for assessing individual performance, as only they can make "reliable fine-grained distinctions." They propose that soft metrics are admissible for research studies, whose results are averaged over many subjects, and where the outcomes do not reflect upon any individual. When soft metrics used in research are adapted to evaluate individuals, the margins of error are large (according to the very definition of soft metric). For such metrics, an assessment outcome of, for example, "you are at level 4" is misleading and potentially harmful, when a more accurate report might be "an 85% certainty that you are within levels 3, 4, or 5" (my example, not a quote from the paper).

Stein and Heikkinen go on to do a "limited and exploratory literature review of metrics currently in play," looking for published evidence of validity and reliability quality assessments. The paper's Table 2 summarizes this review, and includes work by Torbert, Cook-Greuter, Jaques, Kegan, Beck & Cowan, Graves, Commons, and Dawson (and their colleagues). The results "reveal a conspicuous lack of psychometric rigor on the part of some of the most popular developmental approaches" (p. 4). The only metrics that rise to the level of calibrated measurement are those used in the work of Dawson and colleagues (which draws on Commons' and Fischer's developmental models). "It appears that the LAS and HCSS are the only metrics that have been calibrated using quantitative indexes of internal consistency" (p. 19). Stein is transparent about the fact that he is Dawson's partner in a commercial venture based upon Dawson's LAS scoring system.

---

[1] This article continues to take up issues of praxis ethics, following papers at 2008 Integral Theory Conference and in *Integral Leadership Review*, in which Stein and Heikkinen suggest that there is a persistent fact/value confusion in the field of developmental research and application, in which higher levels of development are assumed, implicitly or without sufficient justification, to be desired and of superior value.

Pointing to the non-exhaustive nature of the literature review (they searched in Google Scholar and PsycINFO using a reasonable set of keywords), the authors say they are "just trying to kick-start a concerted discourse about quality control in the field" and they invited colleagues to "work together to fill out and expand the [publications list], making clear to each other and to all those affected exactly what we are doing" (p. 19).

The Invitation

At *Integral Review*, we are interested in fostering theory/praxis integration and see acts of publication themselves as opportunities to investigate integral principles. Stein and Heikkinen's prescriptions are far reaching and their analysis is provocative. They call upon individual scholars and the field as a whole to take a hard look at the ethical implications of their work. As the lines between academic research and commerce increasingly blur in all scholarly fields, such questions become both more critical and more harrowing to address with authenticity and openness. In our invitation for responses we said we were interested in submissions that

> integrate first-, second-, and third-person perspectives, and illustrate an author's embodiment of higher (second tier, integral, metasystematic, etc.) levels of ethical and psycho-socio-systemic reflection. We believe that a community of "integral" scholars (however we might define it) has the potential to engage in dialogs that embrace authenticity/vulnerability/empathy *and* rigor at levels rarely seen in academic discourse.

In other words, to what extent can the scholarly author or the business practitioner (so often one and the same these days) openly reflect upon and be transparent about deeper motives, possible biases and blind spots, emotional overtones, and uncertainties? Can we as colleagues (and often as friends) in dialog pose insightful yet caring questions that support integrity and transparency without falling into patterns of critique that feed more destructive than constructive to the recipient? This challenge is romantic and naïve if not tempered by an acknowledgement of the acute difficulties and complexities it raises. But we have hopes that articles in the integral community might illustrate some small but significant movement at this leading edge. The in-person dialogs at Torbert's meeting certainly seemed to illustrate this potential. We will leave it to the reader to judge how well the respondents did so.

Responses to the Article

We were pleased to accept a number of responses, introduced below. Our first response came in an informal letter from Bill Torbert which was published in IR's Occasional Newsletter #7, July 2009, along with a reply from Stein (see link in the Table of Contents). We also want to note Terri O'Fallon's piece in *Integral Leadership Review* (also linked in the Table of Contents) which is a description of the October 3rd meeting at Bill Torbert’s house, which arose as a response to Stein and Heikkinen’s article.

We begin this section of responses with a transcript of the *Closing Conversation of the “Validity Day” Meeting at Bill Torbert’s, October 3, 2009.* This transcript portrays a rich cast of characters deeply engaged in an intense and generative conversation that was the culmination of this meeting. It addresses the challenges ahead as the field of developmental psychology enters into a time when such psychometrics are becoming more in demand and when practitioners may not have the depth of rigorous knowledge felt necessary to use such tools appropriately. Thus an intention emerged for a knowledgeable group to form a community of inquiry to better lay some critical foundations for how this future unfolds.

Bill Torbert and Reut Livne-Tarandach sent an in-depth (19 page) reply (noted above in our peer review section) in *Reliability and Validity Tests of the Harthill Leadership Development Profile in the Context of Developmental Action Inquiry Theory, Practice and Method.* Torbert and Livne-Tarandach "challenge [Stein & Heikkinen's] critique of the LDP as a soft measure unsupported by published, quantitative psychometric reliability and validity studies … and present both previously unpublished and previously published-but-not-aggregated studies illustrating Harthill LDP as a well-calibrated measure of adult ego-development." They also "consider what a social science and a social practice based on the developmentally late action-logics will look like [once it embraces] 1st-, 2nd-, and 3rd-person research and action with co-participants in live settings."

Theo Dawson sent two brief responses (3 pages) that we combined into *Working Within the Limits: Thoughts on Stein and Heikkinen.* She reflects upon the nature of assessment validity and reliability and upon the constraints upon real-life use of such instruments. She included an appendix titled *Reliability – Some Basics* to help our readers understand some of the subtleties of the topic. She comments on the practical use, or lack thereof, that developmental measurements may have for end users, noting that "the more we hone in on a measureable dimension—the greater our precision becomes—the narrower the construct becomes." She continues by saying that "Formal measures, no matter how many great ones we design, should always be employed by knowledgeable mentors, clinicians, teachers, or coaches as a single item of information about learners that may or may not provide useful insights into their needs.”

In *A Personal Counterpoint to Stein and Heikkinen* (3 pages) Michael Basseches suggests that in addition to questions of validity and reliability, it is equally important to question the use to which developmental assessments are put. He takes Dawson's concerns further and cautions against the potential of a "tyranny of measures that replaces respectful discourse and collective adaptation as the social context." He uses the developmental capacity of dialectical thinking from his own research to illustrate. Only when one has "encountered the limits of [their] lower level structure [i.e., formal operational thought], and begun to glimpse the power of the novel alternative to transcend those limits [i.e., dialectical intelligence]" is one in a position to appreciate the implications of an assessment of dialectical intelligence (or any higher stage capacity).

In *Further Issues in Stage Metrics* (5 page response, plus 5 pages of References and Appendices) Michael Lamport Commons takes the opportunity to clarify the nature and history of the Model of Hierarchical Complexity—the construct and the surrounding theory. Zak's own work with the LAS (with Dawson) draws strongly from Commons' work, so this response provides a deepening background context for Stein and Heikkinen's paper. Commons also differentiates his work from Fischer's Skill Theory, which also contributed substantially the LAS.

From the commercial side of the street comes a response from the principals at InterKannections (ikan.biz). *A Practitioners' Perspective on Developmental Models, Metrics and Community* (19 pages) by Chad Stewart, Zach Smith and Norio Suzuki, gives a peek at a range of assessment instruments being used by a particular consulting company. The authors describe integrally-informed instruments that they have developed or adapted for assessing a range of constructs important to businesses, including 360 performance evaluations, leadership profiling tools, and an organizational sustainability scorecard. They conclude that purely linguistic evaluation instruments must be supplemented by performance-based assessments and metrics that evaluate outcomes (lagging indicators) as well as internal capacities (leading indicators).

Through the ensuing debate I was moved to pen a response titled *Intuiting the Cognitive Line in Developmental Assessment: Do Heart and Ego Develop According to Hierarchical Integration*? in which I explore some of the underlying issues in a question that came in these debates regarding developmental assessments: are they too tied to "the cognitive line" (or language skills)? In this informal analysis I inquire into whether the development of capacities related to heart, ego, and spirit can be captured using current models based on hierarchical integration and coordination.

In his rejoinder *Educational Crises and the Scramble for Usable Knowledge,* Zak Stein carries forward his appeal for more serious discussion among the designers and users of developmental models and tools, this being a third installment in what he intends as a series of papers on the theme. He argues that the profound challenges facing global society today "have critical educational dimensions" yet the "pressing global demand for innovative educational solutions… has the potential to systematically distort the production of relevant usable knowledge" about human learning and development. He iterates his previously-expressed support for Sara Ross's 2008 call for an "Institute for Applied Developmental Theory" focusing on quality control and fostering collaboration." He goes on to identify issues within the community of developmentalists that he sees as inhibiting the quality of dialog necessary to make sufficient progress.

In her rejoinder *It's an Empirical Question: On Cognition and Ego,* Katie Heikkinen jumps bravely into rarely explored territory in warning against the phenomena of disqualifying the arguments of a colleague because of perceived developmental inadequacies (coming from a lower developmental position). She follows Stein's rejoinder comments section on *Lack of Epistemic Humility*. This "labeling colleagues" territory is rich, sensitive, and nuanced. In part due to some of Wilber's arguments and others mentioning "adequatio," it has become common doctrine in the integral community that one can't "see" stuff at higher levels than they are at, at least along a particular developmental line. And differences in expertise in any domain can be (is not always) hierarchical in nature. But putting this intuition to use with real people in real contexts, and fleshing out which elements of it are true, useful, and/or ethical, is problematic. In addition to raising questions of how we could, or whether we would ever want to, "objectively" assess scholarly adequacy in a domain, it raises the question of whether we can profess and value humility, yet be able to compassionately and squarely look at deeply ingrained forms of "arrogance" that are tacitly cultivated in academic work. In a sense we know "labeling colleagues" is wrong, and Heikkinen and Stein help articulate why, but when we catch ourselves engaged in this type of thought, individually (I certainly have) or systemically, what options are available to us in open dialog and self/system analysis?

Heikkinen's discussion on this theme is limited to a particular issue, but she and Stein open a Pandora's box that may hold extensive treasures should the community take up this delicate issue in more depth and breadth. The issue points to a possible shadow element of the integral community of theory and practice. As was said in IR's invitation for responses "such questions become both more critical and more harrowing to address with authenticity and openness," yet we believe that a community of “integral” scholars (however we might define it) has the potential to engage in dialogs that embrace authenticity/vulnerability/empathy and rigor at levels rarely seen in academic discourse." Any takers? Write to us!

Anyways, back to Heikkinen's rejoinder. Following her discussion on "labeling colleagues" she asks some frank questions about whether any of the respondents addressed the core questions about calibrated metrics. She goes on to explore questions raised in my own article on whether wisdom skills can be evaluated using hierarchical complexity. Finally, she describes her current research project involving recoding Kegan's Subject-Object Interview data using the Hierarchical Complexity and the LAS.

Concluding Thoughts

In the end we see that Stein and Heikkinen’s June 2009 paper served well to motivate a wide range of responses on the general theme the appropriate use of developmental assessments, and to further the dialog on this important topic. Their call for assistance in filling in their table of published findings on the validity of developmental instruments was answered only by Torbert. Issues surrounding the practical usefulness and valid application of developmental tests were widely addressed, but Stein and Heikkinen's core concern about whether we are doing more harm than good in offering clients measurement results that are not transparent about their degree of uncertainty was not picked up by many.

Test validity and reliability are very time-consuming to establish, and require access to controlled situations and large numbers of data points. They also require instruments that remain fixed (that the measurement tool is constant), which prohibits the type of ongoing-improvement that characterize most practical methodologies. Many instruments capture a particular model for categorizing human capacities (such as the Myers-Briggs assessment) that have proven to be "tried and true" useful in the field for "adding value" to clients and customers, but have not been proven to have the psychometric properties the Stein and Heikkinen claim are necessary for accurate (thus ethical) use. Is using such instruments like the story of the man who lost his keys in the bushes but was looking for them under the street lamp because "the light was better there”?

But it is not that clear cut. One thing that several of the authors working in commercial contexts allude to indirectly is the potential for these instruments to serve as meaning-generating and self-reflection tools. Given a categorizing scheme, whether it be Action-logics, Enneagram types, or Astrological types, one can assess individuals (or groups) and present the scheme as a conversational tool for framing weaknesses, strengths, goals, opportunities, and intentions. If the uncertainty of any measurement is clarified, perhaps supplemented by self-evaluation ("what category do you think you are in?"), then instruments that lack strong validity or reliability can nonetheless be quite useful. On the other hand, repeated client feedback that the consultation seemed insightful and quite useful can mislead the practitioner into thinking that the tool is valid and reliable, and no substitute for rigorous psychometric evaluation.

The responses suggest that we may benefit from differentiating two contexts. In cases where assessments are used by third parties of make judgments that will have an effect on the lives of individuals, great care must be taken to avoid a "tyranny of measures." On the other hand, when the instruments are used by individuals or groups in dialogic, self-reflective first-, second-, third-person meaning-generation processes, the validity and reliability standards can be relaxed and still prove ethical and useful.

Responses to Stein and Heikkinen's original paper, including Stein and Heikkinen's Rejoinders, may have raised more questions than they answered, and to me it feels as though on many topics we are still in mid or early dialog, as a community of inquiry. We invite further thoughts, responses, and articles from our readers, which we may publish in our next newsletter, or our next Issue.

I hope you enjoy this issue!

The Coherent Heart
Heart–Brain Interactions, Psychophysiological Coherence, and the Emergence of System-Wide Order

Rollin McCraty, Ph.D., Mike Atkinson, Dana Tomasino, B.A., and Raymond Trevor Bradley, Ph.D.[1]

Abstract: This article presents theory and research on the scientific study of emotion that emphasizes the importance of coherence as an optimal psychophysiological state. A dynamic systems view of the interrelations between psychological, cognitive and emotional systems and neural communication networks in the human organism provides a foundation for the view presented. These communication networks are examined from an information processing perspective and reveal a fundamental order in heart-brain interactions and a harmonious synchronization of physiological systems associated with positive emotions. The concept of coherence is drawn on to understand optimal functioning which is naturally reflected in the heart's rhythmic patterns. Research is presented identifying various psychophysiological states linked to these patterns, with neurocardiological coherence emerging as having significant impacts on well being. These include psychophysiological as well as improved cognitive performance. From this, the central role of the heart is explored in terms of biochemical, biophysical and energetic interactions. Appendices provide further details and research on; psychophysiological functioning, reference previous research in this area, details on research linking coherence with optimal cognitive performance, heart brain synchronization and the energetic signature of the various psychophysiological modes.

Keywords: Cognitive performance, coherence, emotion, heart rate variability, heart-brain interactions, neurocardiology, psychophysiological coherence, quantum holographic principles.

> *…there are organism states in which the regulation of life processes becomes efficient, or even optimal, free-flowing and easy. This is a well established physiological fact. It is not a hypothesis. The feelings that usually accompany such physiologically conducive states are deemed "positive," characterized not just by absence of pain but by varieties of pleasure. There also are organism states in which life processes struggle for balance and can even be chaotically out of control. The feelings that usually accompany such states are deemed "negative," characterized not just by absence of pleasure but by varieties of pain. … The fact that we, sentient and sophisticated creatures, call certain feelings positive and other feelings negative is directly related to the fluidity or strain of the life process.*
> (Damasio, 2003, p. 131)

Prologue[2]

> *Chris, a 45-year-old business executive, had a family history of heart disease, and was feeling extremely stressed, fatigued, and generally in poor emotional health. A 24-hour heart rate variability analysis[3] revealed abnormally depressed activity in both branches of his autonomic nervous system, suggesting autonomic exhaustion ensuing from maladaptation to high stress levels. His heart rate variability was far lower then would be expected for his age, and was below the clinical cut-off level for significantly increased risk of sudden cardiac death. In addition, Chris's average heart rate was abnormally high at 102 beats per minute, and his heart rate did not drop at night as it should.*
>
> *Upon reviewing these results, his physician concluded that it was imperative that Chris take measures to reduce his stress. He recommended that Chris begin practicing a system of emotional restructuring techniques that had been developed by the Institute of HeartMath. These positive emotion-focused techniques help individuals learn to self-generate and sustain a beneficial functional mode known as psychophysiological coherence, characterized by increased emotional stability and by increased synchronization and harmony in the functioning of physiological systems.*
>
> *Concerned about his deteriorating health, Chris complied with his physician's recommendation. Each morning during his daily train commute to work, he practiced the Heart Lock-In technique, and he would use the Freeze-Frame technique in situations when he felt his stress levels rise.[4]*

---

[2] Excerpted from McCraty & Tomasino (2006), pp. 360-361.

[3] The analysis of heart rate variability (HRV), a measure of the naturally occurring beat-to-beat changes in heart rate, provides an indicator of neurocardiac fitness and autonomic nervous system function. Abnormally low 24-hour HRV is predictive of increased risk of heart disease and premature mortality. HRV is also highly reflective of stress and emotions.

[4] The Heart Lock-In tool is an emotional restructuring technique, generally practiced for 5 to 15 minutes, that helps build the capacity to sustain the psychophysiological coherence mode for extended periods of time. The Freeze-Frame technique is a one-minute positive emotion refocusing exercise used in the moment that stress is experienced to change perception and modify the psychophysiological stress response. For in-depth descriptions of these techniques, see Childre & Martin (1999) and Childre & Rozman (2005).

> *At first Chris was not aware of the transformation that was occurring. His wife was the first to notice the change and to remark about how differently he was behaving and how much better he looked. Then his co-workers, staff, and other friends began to comment on how much less stressed he appeared in responding to situations at work and how much more poise and emotional balance he had. A second autonomic nervous system assessment, performed six weeks after the initial one, showed that Chris's average heart rate had decreased to 85 beats per minute and it now lowered at night, as it should. Significant increases were also apparent in his heart rate variability, which had more than doubled! These results surprised Chris' physician, as 24-hour heart rate variability is typically very stable from week to week, and it is generally quite difficult to recover from autonomic nervous system depletion, usually requiring much longer than six weeks.*
>
> *In reflecting on his experience, Chris started to see how profoundly his health and his life had been transformed. He was getting along with his family, colleagues, and staff better than he could remember ever having enjoyed before, and he felt much more clearheaded and in command of his life. His life seemed more harmonious, and the difficulties that came up at work and in his personal relationships no longer created the same level of distress; he now found himself able approach them more smoothly and proactively, and often with a broadened perspective.*

The true story of Chris's transformation is not an isolated example, but rather is only one of many similar case histories that people like Chris have shared with HeartMath, illustrating the amazing transformations that can occur when one learns how to increase psychophysiological coherence.

Introduction

Many contemporary scientists believe that the quality of feeling and emotion we experience in each moment is rooted in the underlying state of our physiological processes. This view is well expressed by neuroscientist Antonio Damasio in the epigram that opened this article. The essence of his idea is that we call certain emotional feelings "positive" and others "negative" because these experiences directly reflect the impact of the "fluidity or strain of the life process" on the body, as is clearly evident in Chris' case, above. The feelings we experience as "negative" are indicative of body states in which "life processes struggle for balance and can even be chaotically out of control" (Damasio, 2003, p. 131). By contrast, the feelings we experience as "positive" actually reflect body states in which "the regulation of life processes becomes efficient, or even optimal, free-flowing and easy" (Damasio, p. 131).

While there is a growing appreciation of this general understanding in the scientific study of emotion, here we seek to deepen this understanding in three primary ways. First, our approach is based on the premise that the physiological, cognitive, and emotional systems are intimately interrelated through ongoing reciprocal communication. To obtain a deeper understanding of the operation of any of these systems, we believe it is necessary to view their activity as emergent from the dynamic, communicative network of interacting functions that comprise the human organism. Second, we adopt an information processing perspective, which views communication within and among the body's systems as occurring through the generation and transmission of *rhythms and patterns* of psychophysiological activity. This points to a fundamental order of information communication—one that both signifies different emotional states, operates to integrate and coordinate the body's functioning as a whole, and also connects the body to the external world. And third, we draw on the concept of *coherence* from the physics of signal processing to understand how different patterns of psychophysiological activity influence bodily function. Efficient or optimal function is known to result from a harmonious organization of the interaction among the elements of a system. Thus, a harmonious order in the rhythm or pattern of psychophysiological activity signifies a coherent system, whose efficient or optimal function is directly related, in Damasio's terms, to the ease and "fluidity" of life processes. By contrast, an erratic, discordant pattern of activity denotes an incoherent system, whose function reflects the difficulty and "strain" of life processes.

In this article we explore the concept and meaning of coherence in various psychophysiological contexts and describe how coherence within and among the physiological, cognitive, and emotional systems is critical in the creation and maintenance of health, emotional stability, and optimal performance. It is our thesis that what we call emotional coherence—a harmonious state of sustained, self-modulated positive emotion—is a primary driver of the beneficial changes in physiological function that produce improved performance and overall well-being. We also propose that the heart, as the most powerful generator of rhythmic information patterns in the body, acts effectively as the global conductor in the body's symphony to bind and synchronize the entire system. The consistent and pervasive influence of the heart's rhythmic patterns on the brain and body not only affects our physical health, but also significantly influences perceptual processing, emotional experience, and intentional behavior.

There is abundant evidence that emotions alter the activity of the body's physiological systems. Yet the vast majority of this scientific evidence concerns the effects of negative emotions. More recently, researchers have begun to investigate the functions and effects of positive emotions. This research has shown that, beyond their pleasant subjective feeling, positive emotions and attitudes have a number of objective, interrelated benefits for physiological, psychological, and social functioning (Fredrickson, 2002; Isen, 1999).

In contributing to this work, we discuss how sustained positive emotions facilitate an emergent global shift in psychophysiological functioning, which is marked by a distinct change in the rhythm of heart activity. This global shift generates a state of optimal function, characterized by increased synchronization, harmony, and efficiency in the interactions within and among the physiological, cognitive, and emotional systems. We call this state *psychophysiological coherence*. We describe how the coherence state can be objectively measured and explore the nature and implications of its physiological and psychological correlates. It is proposed that the global synchronization and harmony generated in the coherence state may explain many of the reported psychological and physiological health benefits associated with positive emotions.

Our discussion of the major pathways by which the heart communicates with the brain and body shows how signals generated by the heart continually inform emotional experience and influence cognitive function. This account includes a review of previous research on heart–brain interactions and theories regarding how the activity of the heart affects brain function and cognitive performance. We then present research conducted in our laboratory, which brings a new perspective, focusing on the *pattern* of the rhythm of heart activity and its relationship to emotional experience. From this vantage point, we derive a new hypothesis—that sustained, self-induced positive emotions generate a shift to a state of system-wide coherence in bodily processes, in which the coherent pattern of the heart's rhythm plays a key role in facilitating higher cognitive functions.

In short, the science reviewed in this article shows that through regular heart-based practice, it is possible to use positive emotions to shift one's whole psychophysiological system into a state of global coherence. When sustained, the harmonious order of coherence generates vital benefits on all levels and can even transform an individual's life, as we saw in the prologue describing Chris's story.

Theoretical Considerations

We begin by introducing the basic concepts and theoretical ideas that inform the material presented in this article.

Conceptual Framework

Integral to the understanding of psychophysiological interaction developed in this work are the concepts of information and communication. As we will see next, coherence is a particular quality that emerges from the relations among the parts of a system or from the relations among multiple systems. And since relations are constitutive of systems, the communication of information plays a fundamental constructive role in the generation and emergence of coherence. Although the communication of information is largely implicit in the interactional basis of the three basic concepts of coherence we begin with in this conceptual framework, we go onto develop a detailed account of the nature, substance, and dynamics of the psychophysiological interactions between the heart, the brain, and the body as a whole.

Information and Communication

The most basic definition of *information* is data which *in-form*, or give shape to, action or behavior, such as a message that conveys "meaning" to the recipient of a signal (Bradley & Pribram, 1998). In human language, abstract symbols like words, numbers, graphical figures, and even gestures and vocal intonations are used to encode the meaning conveyed in a message. In physiological systems, changes in chemical concentrations, the amount of biological activity, or the pattern of rhythmic activity are common means by which information is encoded in the movement of energy to inform system behavior.

But in order to be used to shape or regulate system behavior, the information must be distributed to and "understood" by the system elements involved. Thus, by *communication* we mean a process by which meaning is encoded as a message and transmitted in a signal to be received, processed, and comprehended by the various elements of a system.

The Concept of Coherence

In this article we describe the relationship between different patterns of psychophysiological activity and physiological, emotional and cognitive functions by drawing on three distinct but related concepts of coherence used in physics; *global coherence, cross coherence* and *auto-coherence*. The most common definition of coherence is "the quality of being logically integrated, consistent and intelligible," as in a coherent argument. A related meaning is "a logical, orderly and aesthetically consistent relationship of parts" (McCraty & Tomasino, 2006, p. 4). In the following discussion we delve deeper into the meaning of coherence.

Coherence in ordinary language means correlation, a sticking together, or connectedness; also, a consistency in the system. So we refer to people's speech or thought as coherent, if the parts fit together well, and incoherent if they are uttering meaningless nonsense, or presenting ideas that don't make sense as a whole (Ho, 1998). Thus, coherence in this context refers to wholeness and a global order: This is coherence as a distinctive organization of parts, the relations among which generate an emergent whole that is greater than the sum of the individual parts. In the example of organizing words in a coherent sentence, the meaning and purpose conveyed by the arrangement of the words is greater than the individual meaning of each word.

It is important to note that all systems, to produce any function or action, must have the property of *global coherence*. The efficiency and effectiveness of the function or action can vary widely, however, and therefore does not necessarily result in a coherent flow of behavior. Global coherence does not mean that everybody or all the parts are doing the same thing at the same time. Think of a jazz band for example, where the individual players are each doing his or her own thing, yet keeping in tune and step with the whole band. Coherence in this sense maximizes local freedom and global cohesion and resonance with the musical theme (Ho, 1998).

In a living system global order or coherence must be sustained and maintained over time. For example, biochemist and geneticist Mae-Wan Ho (1998) has suggested that a whole living system is a domain of coherent, autonomous activity that is coordinated across a continuum from the molecular to macroscopic to social levels.

In physics, the concept of coherence is also used to describe the interaction or coupling among different oscillating systems in which synchronization is the key idea in this concept. Synchronization describes the degree to which two or more waves are either phase or frequency-locked together, or when communication occurs between systems or modes without obstruction.

Returning to the music example, a chord is composed of notes of different frequencies yet resonate as a harmonious order of sound waves. In physiology, coherence is similarly used to describe the degree of coupling and harmonious interaction between two or more of the body's oscillatory systems such as respiration and heart rhythms. There are modes where they are operating at different frequencies, and modes when they become entrained and oscillate at the same frequency. This is also true for brain states in which the brainwaves can be momentarily in phase at different locations across the brain. The term *cross-coherence* is used to specify this type aspect of coherence.

Another example, from a physiological systems perspective, is that people's thoughts, emotions and attitudes can either be aligned and coherent or incoherent. When individuals think one way, feel another, and behave inconsistently, they are in an inefficient and ineffective state-that's non-coherence. A situation adults commonly face illustrates another kind of incoherence. For example, if a child has hit another child and must be taught to be kind to others and that hitting is not acceptable, consider the internal state of an adult in the following two scenarios:

1. The adult who punishes the child with a spanking for hitting another child.
2. The adult who takes time to teach and encourage the child to apologize and render an act of service or kindness to the other child. In this instance, the thoughts, feelings and actions of the adult are in coherent alignment with the message being taught. Then the child is more likely to have a coherent understanding of the lesson being taught.

Another aspect of coherence relates to the dynamics of the flow of action produced by a single system (McCraty & Tomasino, 2006). This is *coherence as a uniform pattern of cyclical behavior*. Because this pattern of action is generated by a single system, the term *auto-coherence* is used to denote this type of coherence. This concept is commonly used in physics to describe the generation of an ordered distribution of energy in a waveform. An example is a sine wave, which is a perfectly coherent wave. The more stable the frequency, amplitude, and shape of the waveform, the higher the degree of coherence. In physiological systems, this type of coherence describes the degree of order and stability in the rhythmic activity generated by a single oscillatory such as the hearts rhythmic activity. When coherence is increased in a single system that is coupled to other systems, it can pull the other systems into coherence or *entrainment*, resulting in increased cross-coherence in the activity of the other systems, even across different time scales of activity. An example of this is in the increased heart-brain synchronization that occurs in a heart coherent mode.

Theory

The material presented in this article is informed by the following theoretical considerations. Our psychophysiological systems process an enormous amount of information, which must be continuously communicated from one part of the brain or body to another and often stored as a memory of one type or another. The traditional approach to understanding how the body's systems interact adopts an activation perspective, in which variation in the *amount* of a substance or the *amount* of a given physiological activity is viewed as the basis of communication. Although the amount of activity is clearly an important aspect of communication, the generation and transmission of *rhythms and patterns* of physiological activity appear reflective of a more fundamental order of information communication—one that signifies different emotional states and operates to integrate and coordinate the body's functioning as a whole.

Throughout the body, information is encoded in waveforms of energy as patterns of physiological activity. Neural, chemical, electromagnetic, and oscillatory pressure wave patterns are among those used to encode and communicate biologically relevant information. By these means, the body's organs continually transmit information to the brain as patterns of afferent (ascending) input. In turn, as we will see below, changes in the patterns of afferent input to the brain cause significant changes in physiological function, perception, cognition, emotion, and intentional behavior.

A primary proposition explored in this article is that different emotions are associated with distinct patterns of physiological activity. This is the result of a two-way process by which, in one direction, emotions trigger changes in the autonomic nervous system and hormonal system, and in the other direction, specific changes in the physiological substratum are involved in the generation of emotional experience. Research at the Institute of HeartMath has identified six distinct patterns of physiological activity generated during different emotional states. We call these *psychophysiological modes*. Each of these is described in detail in Appendix A. Of particular significance is the *psychophysiological coherence* mode, which is characterized by ordered, harmonious patterns of physiological activity. This mode has been found to be generated during the experience of sustained positive emotions. The psychophysiological coherence mode has numerous physiological and psychological benefits, which can profoundly impact health, performance, and quality of life.

A second proposition is that the heart plays a central role in the generation and transmission of system-wide information essential to the body's function as a coherent whole. There are multiple lines of evidence to support this proposition: The heart is the most consistent and dynamic generator of rhythmic information patterns in the body; its intrinsic nervous system is a sophisticated information encoding and processing center that operates independently of the brain; the heart functions in multiple body systems and is thus uniquely positioned to integrate and communicate information across systems and throughout the body; and, of all the bodily organs, the heart possesses by far the most extensive communication network with the brain. As described subsequently, afferent input from the heart not only affects the homeostatic regulatory centers in the brain, but also influences the activity of higher brain centers involved in perceptual, cognitive, and emotional processing, thus in turn affecting many and diverse aspects of our experience and behavior. These are the central ideas that guide what follows.

The Psychophysiological Network: A Systems Perspective

As science has increasingly adopted a systems perspective in investigation and analysis, the understanding has emerged that our mental and emotional functions stem from the activity of *systems*—organized pathways interconnecting different organs and areas of the brain and body—just as do any of our physiological functions. Moreover, our mental and emotional systems cannot be considered in isolation from our physiology. Instead, they must be viewed as an integral part of the dynamic, communicative network of interacting functions that comprise the human organism.

These understandings have led to the emergence and growth of new scientific fields of study, such as psychophysiology. Psychophysiology is concerned with the interrelations among the physiological, cognitive, and emotional systems and human behavior. It is now evident that every thought, attitude, and emotion has a physiological consequence, and that patterns of physiological activity continually influence our emotional experience, thought processes, and behavior. As we will see shortly, the efficacy of this perspective has been substantiated by our own research, as well as that of many others, examining how patterns of psychophysiological activity change during stress and different emotional states.

Heart Rate Variability and Measurement of Psychophysiological Modes

In the early stages of our work at the Institute of HeartMath, we sought to determine which physiological variables were most sensitive to and correlated with changes in emotional states. In analyzing many different physiological measures (such as heart rate, electroencephalographic and electromyographic activity, respiration, skin conductance, etc.), we discovered that the *rhythmic pattern of heart activity* was directly associated with the subjective activation of distinct emotional states, and that the heart rhythm pattern also reflected changes in emotional states, in that it covaried with emotions in real time. We found strong differences between quite distinct rhythmic beating patterns that were readily apparent in the heart rhythm trace and that directly matched the subjective experience of different emotions. In short, we found that the pattern of the heart's activity was a valid physiological indicator of emotional experience and that this indicator was reliable when repeated at different times and in different populations.

In more specific terms, we examined the natural fluctuations in heart rate, known as *heart rate variability* (HRV). HRV is a product of the dynamic interplay of many of the body's systems. Short-term (beat-to-beat) changes in heart rate are largely generated and amplified by the interaction between the heart and brain. This interaction is mediated by the flow of neural signals through the efferent and afferent pathways of the sympathetic and parasympathetic branches of the autonomic nervous system (ANS). HRV is thus considered a measure of neurocardiac function that reflects heart–brain interactions and ANS dynamics.

From an activation theory perspective, the focus is on changes in heart *rate* or in the *amount* of variability that are expected to be associated with different emotional states. However, while these factors can and often do covary with emotions, we have found that it is the *pattern* of the heart's rhythm that is primarily reflective of the emotional state. Furthermore, we have found that changes in the heart rhythm pattern are independent of heart *rate*: one can have a coherent or incoherent pattern at high or low heart rates. Thus, it is the rhythm, rather than the rate, that is most directly related to emotional dynamics and physiological synchronization.

Emotions and Heart Rhythm Patterns

As mentioned at the outset, researchers have spent much time and effort investigating how emotions change the state and functioning of the body's systems. While the vast majority of this body of work has focused on understanding the pathological effects of negative emotions, recent research has begun to balance this picture by investigating the functions and effects of positive emotions.

A synthesis of the voluminous work in developmental neurobiology has shown that the modulation of positive emotions plays a critical role in infant growth and neurological development, which has enormous consequences for later life (Schore, 1994). Other research on adults has documented a wide array of effects of positive emotions on cognitive processing, behavior, and health and well-being. Positive emotions have been found to broaden the scope of perception, cognition, and behavior (Fredrickson, 2001, 2005; Isen, 1999), thus enhancing faculties such as creativity (Isen, 1998) and intuition (Bolte, Goschke, & Kuhl, 2003). Moreover, the experience of frequent positive emotions has been shown to predict resilience and psychological growth, (Fredrickson, Tugade, Waugh, & Larkin, 2003) while an impressive body of research has documented clear links between positive emotions, health status, and longevity (Blakeslee & Grossarth-Maticek, 1996; Danner, Snowdon, & Friesen, 2001; Medalie & Goldbourt, 1976; Moskowitz, 2003; Ostir, Markides, Black, & Goodwin, 2000; Ostir, Markides, Peek, & Goodwin, 2001; Russek & Schwartz, 1997; Seeman & Syme, 1987). In addition, there is abundant evidence that positive emotions affect the activity of the body's physiological systems in profound ways. For instance, studies have shown that positive emotional states speed the recovery of the cardiovascular system from the after-effects of negative emotions (Fredrickson et al., 2000), alter frontal brain asymmetry (Davidson et al., 2003), and increase immunity (Davidson et al.; McCraty, Atkinson, Rein, & Watkins, 1996; Rein, Atkinson, & McCraty, 1995). Finally, the use of practical techniques that teach people how to self-induce and sustain positive emotions and attitudes for longer periods has been shown to produce positive health outcomes. These include reduced blood pressure in both hypertensive and normal populations, (McCraty, Atkinson, Lipsenthal, et al., 2003; McCraty, Atkinson, & Tomasino, 2003) improved functional capacity in patients with heart failure (Luskin, Reitz, Newell, Quinn, & Haskell, 2002), improved hormonal balance, (McCraty, Barrios-Choplin, Rozman, Atkinson, & Watkins, 1998) and lower lipid levels (McCraty, Atkinson, Lipsenthal, et al., 2003).

In investigating the physiological foundation of this important work, we have utilized HRV analysis to show how distinct heart rhythm patterns characterize different emotional states. In more specific terms, we found that underlying the experience of different emotional states there is a distinct physiology directly involved. Thus we have found that sustained positive emotions such as appreciation, care, compassion, and love generate a smooth, sine-wave-like pattern in the heart's rhythms. This reflects increased order in higher-level control systems in the brain, increased synchronization between the two branches of the ANS, and a general shift in autonomic balance towards increased parasympathetic activity. As is visually evident (Figure 1) and also demonstrable by quantitative methods, heart rhythms associated with positive emotions, such as appreciation, are clearly more *coherent*—organized as a stable pattern of repeating sine waves—than those generated during a negative emotional experience such as frustration. We observed that this association between positive emotional experience and this distinctive physiological pattern was evident in studies conducted in both laboratory and natural settings, and for both spontaneous emotions and intentionally generated feelings (McCraty, Atkinson, Tiller, Rein, & Watkins, 1995; Tiller, McCraty, & Atkinson, 1996).

By contrast, our research has shown that negative emotions such as frustration, anger, anxiety, and worry lead to heart rhythm patterns that appear *incoherent*—highly variable and erratic. Overall, this means that there is less synchronization in the reciprocal action of the parasympathetic and sympathetic branches of the ANS (McCraty et al., 1995; Tiller et al., 1996). This desynchronization in the ANS, if sustained, taxes the nervous system and bodily organs, impeding the efficient synchronization and flow of information throughout the psychophysiological systems. Furthermore, as studies have also shown that prefrontal cortex activity is reflected in HRV via modulation of the parasympathetic branch of the ANS (Lane, Reiman, Ahern, & Thayer, 2001), this increased disorder in heart rhythm patterns is also likely indicative of disorder in higher brain systems.

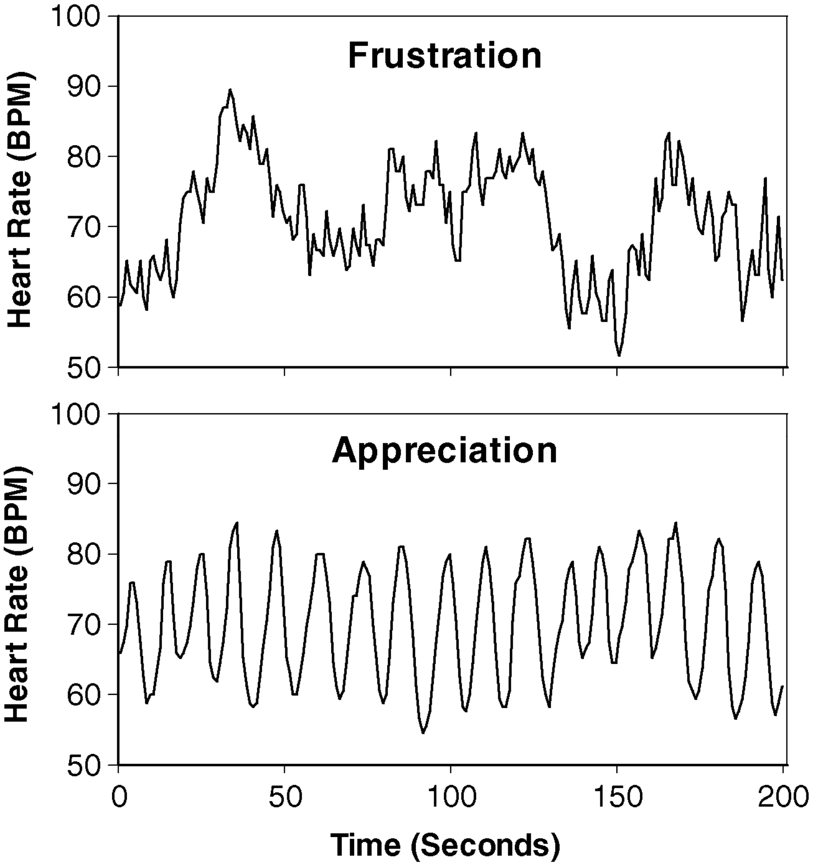

Figure 1. Emotions are reflected in heart rhythm patterns. The heart rhythm pattern shown in the top graph, characterized by its erratic irregular pattern (incoherence), is typical of negative emotions such as anger or frustration. The bottom graph shows an example of the coherent heart rhythm pattern that is typically observed when an individual is experiencing sustained, modulated positive emotions, in this case appreciation.

Psychophysiological Coherence

In our research on the physiological correlates of positive emotions we have found that when certain positive emotional states, such as appreciation, compassion, or love, are intentionally maintained, coherent heart rhythm patterns can be sustained for longer periods, which also leads to increased synchronization and entrainment between multiple bodily systems. Because it is characterized by distinctive psychological and behavioral correlates as well as by specific patterns of physiological activity throughout the body, we introduced the term *psychophysiological coherence*[5] to describe this mode of functioning.

---

[5] In earlier publications (Tiller et al., 1996), the psychophysiological coherence mode was referred to as the “entrainment mode” because a number of physiological systems entrain with the heart rhythm in this mode.

Heart Rhythm Coherence

The development of *heart rhythm coherence*—a stable, sine-wave-like pattern in the heart rate variability waveform—is the key marker of the psychophysiological coherence mode. Heart rhythm coherence is reflected in the HRV power spectrum as a large increase in power in the low frequency (LF) band (typically around 0.1 Hz) and a decrease in the power in the very low frequency (VLF) and high frequency (HF) bands. A coherent heart rhythm can therefore be defined as a relatively harmonic (sine-wave-like) signal with a very narrow, high-amplitude peak in the LF region of the HRV power spectrum and no major peaks in the VLF or HF regions. Coherence thus approximates the LF/(VLF + HF) ratio. (See Appendix A for an explanation of the HRV power spectrum and a description of the physiological significance of the different frequency bands.)

A method of quantifying heart rhythm coherence is shown in Figure 2. First, the maximum peak is identified in the 0.04–0.26 Hz range (the frequency range within which coherence and entrainment can occur). The peak power is then determined by calculating the integral in a window 0.030 Hz wide, centered on the highest peak in that region. The total power of the entire spectrum is then calculated. The coherence ratio is formulated as:

(Peak Power / (Total Power − Peak Power)) (Childre & Martin, 1999)

This method provides an accurate measure of coherence that allows for the nonlinear nature of the HRV waveform over time.

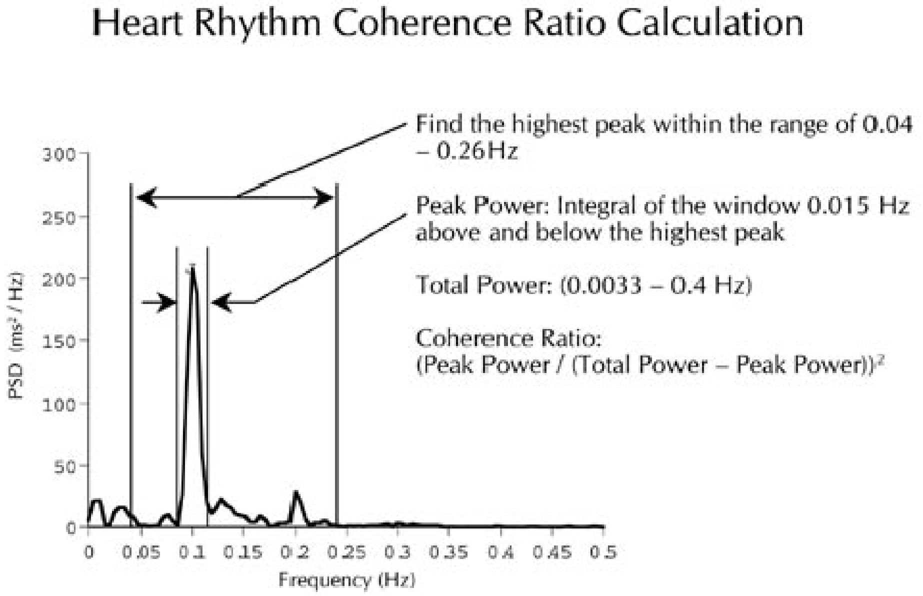

Figure 2. Heart rhythm coherence ratio calculation.

Physiological Correlates

At the physiological level, psychophysiological coherence embraces several related phenomena—autocoherence, entrainment, synchronization, and resonance—which are associated with increased order, efficiency, and harmony in the functioning of the body's systems. As described above, this mode is associated with increased coherence in the heart's rhythmic activity (autocoherence), which reflects increased ANS synchronization and manifests as a sine-wave-like heart rhythm pattern oscillating at a frequency of approximately 0.1 Hz. Thus, in this mode the HRV power spectrum[6] is dominated by a narrow-band, high-amplitude peak near the center of the low frequency band (see Figures 3 below and 8 in Appendix A) (McCraty et al., 1995; Tiller et al., 1996).

Another physiological correlate of the coherence mode is the phenomenon of resonance. In physics, resonance refers to a phenomenon whereby an unusually large oscillation is produced in response to a stimulus whose frequency is the same as, or nearly the same as, the natural vibratory frequency of the system. The frequency of the vibration produced in such a state is defined as the resonant frequency of the system. When the cardiovascular system is operating in the coherence mode, it is essentially oscillating at its resonant frequency; this is reflected in the distinctive high-amplitude peak in the HRV power spectrum around 0.1 Hz. Most mathematical models show that the resonant frequency of the human cardiovascular system is determined by the feedback loops between the heart and brain (Baselli et al., 1994; DeBoer, Karemaker, & Strackee, 1987). In humans and in many animals, the resonant frequency of the system is approximately 0.1 Hz, which is equivalent to a 10-second rhythm. The system naturally oscillates at its resonant frequency when an individual is actively feeling a sustained positive emotion such as appreciation, compassion, or love, (McCraty et al., 1995) although resonance can also emerge during states of deep sleep.

Furthermore, increased heart–brain synchronization is observed during coherence; specifically, the brain's alpha rhythms exhibit increased synchronization with the heartbeat in this mode. This finding is discussed in greater depth in Appendix D.

Finally, there tends to be increased cross-coherence or entrainment among the rhythmic patterns of activity generated by different physiological oscillatory systems. Entrainment occurs when the frequency difference between the oscillations of two or more nonlinear systems drops to zero by being "frequency pulled" to the frequency of the dominant system. As the body's most powerful rhythmic oscillator, the heart can pull other resonant physiological systems into entrainment with it. During the psychophysiological coherence mode, entrainment is typically observed between heart rhythms, respiratory rhythms, and blood pressure oscillations; however, other biological oscillators, including very low frequency brain rhythms, craniosacral rhythms, and electrical potentials measured across the skin, can also become entrained (Bradley & Pribram, 1998; Tiller et al., 1996).

Figure 3 shows an example of entrainment occurring during psychophysiological coherence. The graphs plot an individual's heart rhythm, arterial pulse transit time (a measure of beat-to-beat blood pressure) (Bradley & Pribram, 1998), and respiration rate over a 10-minute period. In this example, after a 300-second normal resting baseline period the subject used a heart-based positive emotion refocusing technique known as Freeze-Frame, (Childre & Martin, 1999) which involves focusing attention in the area of the heart while self-generating a sincere positive emotion, such as appreciation. After the subject used the Freeze-Frame technique, the three rhythms shifted from an erratic to a sine-wave-like pattern (indicative of the coherence mode) and all entrained at a frequency of 0.12 Hz. (Tiller et al., 1996). The entrainment phenomenon is thus an example of a psychophysiological state in which there is increased coherence within each system (autocoherence) *and* among multiple oscillating systems (cross-coherence) as well. This example also illustrates how the intentional generation of a self-regulated positive emotional state can bring about a phase-shift in physiological activity, driving the physiological systems into a globally coherent mode of function.

---

[6] Spectral analysis decomposes the HRV waveform into its individual frequency components and quantifies them in terms of their relative intensity using power spectral density (PSD) analysis. Spectral analysis thus provides a means to quantify the relative activity of the different physiological influences on HRV, which are represented by the individual oscillatory components that make up the heart rhythm.

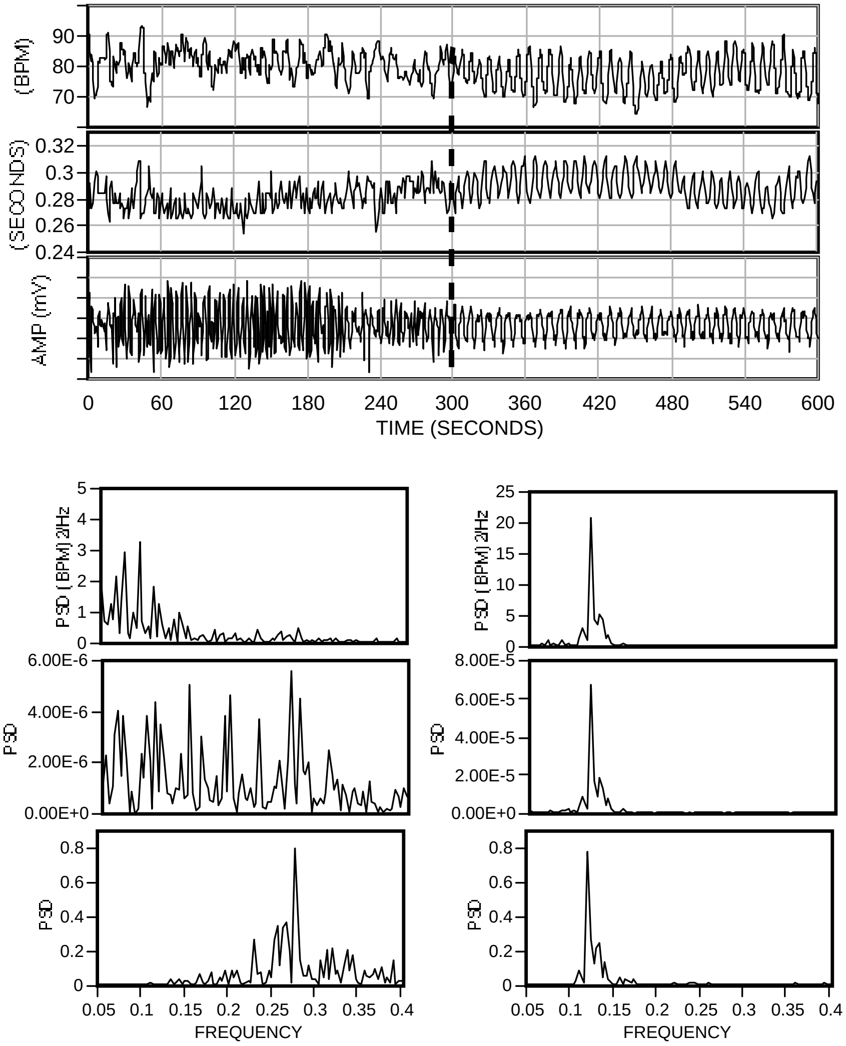

Figure 3. Entrainment. The top graphs show an individual’s heart rate variability, pulse transit time, and respiration rhythms over a 10-minute period. At the 300-second mark, the individual used the Freeze-Frame positive emotion refocusing technique, causing these three systems to come into entrainment. The bottom graphs show the frequency spectra of the same data on each side of the dotted line in the center of the top graph. Notice the graphs on the right show that all three systems have entrained to the same frequency.

Psychological and Behavioral Correlates

The experience of the coherence mode is also qualitatively distinct at the psychological level. This mode is associated with reduced perceptions of stress, sustained positive affect, and a high degree of mental clarity and emotional stability. In Appendix C we also present data indicating that coherence is associated with improved sensory-motor integration, cognition, and task performance. In addition, individuals frequently report experiencing a notable reduction in internal mental dialogue, increased feelings of inner peace and security, more effective decision making, enhanced creativity, and increased intuitive discernment when engaging this mode.

In summary, psychophysiological coherence is a distinctive mode of function driven by sustained, modulated positive emotions. At the psychological level, the term “coherence” is used to denote the high degree of order, harmony, and stability in mental and emotional processes that is experienced during this mode. Physiologically speaking, “coherence” is used here as a general term that encompasses entrainment, resonance, and synchronization—distinct but related phenomena, all of which emerge from the harmonious activity and interactions of the body’s subsystems. Physiological correlates of the coherence mode include: increased synchronization between the two branches of the ANS, a shift in autonomic balance toward increased parasympathetic activity, increased heart–brain synchronization, increased vascular resonance, and entrainment between diverse physiological oscillatory systems.

Drivers of Coherence

Although the physiological phenomena associated with coherence can occur spontaneously, sustained episodes are generally rare. While specific rhythmic breathing methods may induce heart rhythm coherence and physiological entrainment for brief periods, cognitively directed paced breathing is difficult for many people to maintain for more than about one minute (discussed in detail later). On the other hand, we have found that individuals can intentionally maintain coherence for extended periods by self-generating, modulating, and sustaining a “heart-focused” positive emotional state. Using a positive emotion to drive the coherence mode appears to excite the system at its resonant frequency, and coherence emerges naturally, making it easy to sustain for long periods.

Self-regulation of emotional experience is a key requisite to the intentional generation of sustained positive emotions—the driver of a shift to coherent patterns of physiological activity. Emotional self-regulation involves moment-to-moment management of distinct aspects of emotional experience. One aspect involves the neutralization of inappropriate or dysfunctional negative emotions. The other requires that self-activated positive emotions are modulated to remain within the resonant frequency range of such emotions as appreciation, compassion, and love, rather than escalating into feelings such as excitement, euphoria, and rapture, which are associated with more unstable psychophysiological patterns.

A series of tools and techniques, collectively known as the HeartMath System, provide a systematic process that enables people to self-regulate emotional experience and reliably generate the psychophysiological coherence mode (Childre & Martin, 1999; Childre & Rozman, 2002, 2005). The primary focus of these techniques is on facilitating the intentional generation of a sustained, heart-focused positive emotional state. This is accomplished by a process that combines a shift in attentional focus to the area of the heart (where many people subjectively experience positive emotions) which the self-induction of a positive feeling, such as appreciation. Our work has shown that this shift in focus and feeling experience allows the coherence mode to emerge naturally and helps to reinforce the inherent associations between coherence and positive feelings. Our research also suggests that the intentional application of these coherence-building techniques, on a consistent basis, effectively facilitates a *repatterning process* whereby coherence becomes increasingly familiar to the brain and nervous system, and thus progressively becomes established in the neural architecture as new, stable psychophysiological baseline or set point (McCraty, 2003; McCraty & Childre, 2004; McCraty & Tomasio, 2006). Once the coherence mode is established as the familiar pattern, the system then strives to maintain this mode automatically, thus rendering coherence a more readily accessible state during day-to-day activities, and even in the midst of stressful or challenging situations.

At the physiological level, the occurrence of such a repatterning process is supported by electrophysiological evidence demonstrating a greater frequency of spontaneous (without conscious practice of the interventions) periods of heart rhythm coherence in individuals practiced in the HeartMath coherence-building techniques. Furthermore, a number of studies suggest that this “repatterning” process can produce enduring system-wide benefits that significantly impact overall quality of life (discussed below).

While evidence clearly shows that the HeartMath positive emotion refocusing and emotional restructuring techniques lead to increased psychophysiological coherence, other approaches have also been shown to be associated with increased coherence. For example, in a recent UCLA study, Buddhist monks meditating on generating compassionate love tended to exhibit increased coherence, and another study of Zen monks found that the more advanced monks tended to have coherent heart rhythms, while the novices did not (Lehrer et al., 2003). This does not imply, however, that all meditation approaches lead to coherence; as we and others have observed, approaches that focus attention to the mind (concentrative mediation), and not on a positive emotion, in general do not induce coherence.

Benefits of Psychophysiological Coherence

In terms of physiological functioning, coherence is a highly efficient mode that confers a number of benefits to the system. These include: (1) resetting of baroreceptor sensitivity, which is related to improved short-term blood pressure control and increased respiratory efficiency; (2) increased vagal afferent traffic, which is involved in the inhibition of pain signals and sympathetic outflow; (3) increased cardiac output in conjunction with increased efficiency in fluid exchange, filtration, and absorption between the capillaries and tissues; (4) increased ability of the cardiovascular system to adapt to circulatory requirements; and (5) increased temporal synchronization of cells throughout the body. This results in increased system-wide energy efficiency and metabolic energy savings (Lehrer et al., 2003; Langhorst, Schulz, & Lambertz, 1984; Siegel et al., 1984).

Psychologically, the coherence mode promotes a calm, emotionally balanced, yet alert and responsive state that is conducive to cognitive and task performance, including problem-solving, decision-making, and activities requiring perceptual acuity, attentional focus, coordination, and discrimination. Individuals generally experience a sense of enhanced subjective well-being during coherence due to the reduction in extraneous inner "noise" generated by the mental and emotional processing of daily stress and the positive emotion-driven shift to increased harmony in bodily processes. Many also report increased intuitive clarity and efficacy in addressing troublesome issues in life.

The use of coherence-building interventions has been documented in numerous studies to give rise to significant improvements in key markers of both physical and psychological health. Significant improvements in several objective health-related measures have been observed, including immune system function (McCraty et al., 1996; Rein et al., 1995), ANS function and balance (McCraty et al., 1995; Tiller et al., 1996), and the DHEA/cortisol ratio (McCraty et al., 1998). At the emotional level, significant reductions in depression, anxiety, anger, hostility, burnout, and fatigue and increases in caring, contentment, gratitude, peacefulness, and vitality have been measured across diverse populations (Arguelles, McCraty, & Rees, 2003; Barrios-Choplin, McCraty, & Cryer, 1997; Luskin et al., 2002; McCraty et al., 1998; McCraty, Atkinson, Lipsenthal, et al. 2003; McCraty, Atkinson, & Tomasino, 2001, 2003). Other research has demonstrated significant reductions in key health risk factors (e.g., blood pressure, glucose, cholesterol) (McCraty, Atkinson, Lipsenthal, et al., 2003) and improvements in health status and quality of life in various populations using coherence-building approaches. More specifically, significant blood pressure reductions have been demonstrated in individuals with hypertension (McCraty, Atkinson, & Tomasino); improved functional capacity and reduced depression in patients with congestive heart failure (Luskin et al.); improved glycemic regulation and quality of life in patients with diabetes (McCraty, Atkinson, & Lipsenthal, 2000); and improvements in asthma (Lehrer, Smetankin, & Potapova, 2000). Coherence-building interventions have also been found to yield favorable outcomes in organizational, educational, and mental health settings (Arguelles et al., 2003; Barrios-Choplin et al.; Barrios-Choplin, McCraty, Sundram, & Atkinson, 1999; McCraty et al., 2001; McCraty, Atkinson, Lipsenthal, et al.; McCraty, Atkinson, Tomasino, Goelitz, & Mayrovitz, 1999; McCraty & Childre, 2004; McCraty & Tomasio, 2004).

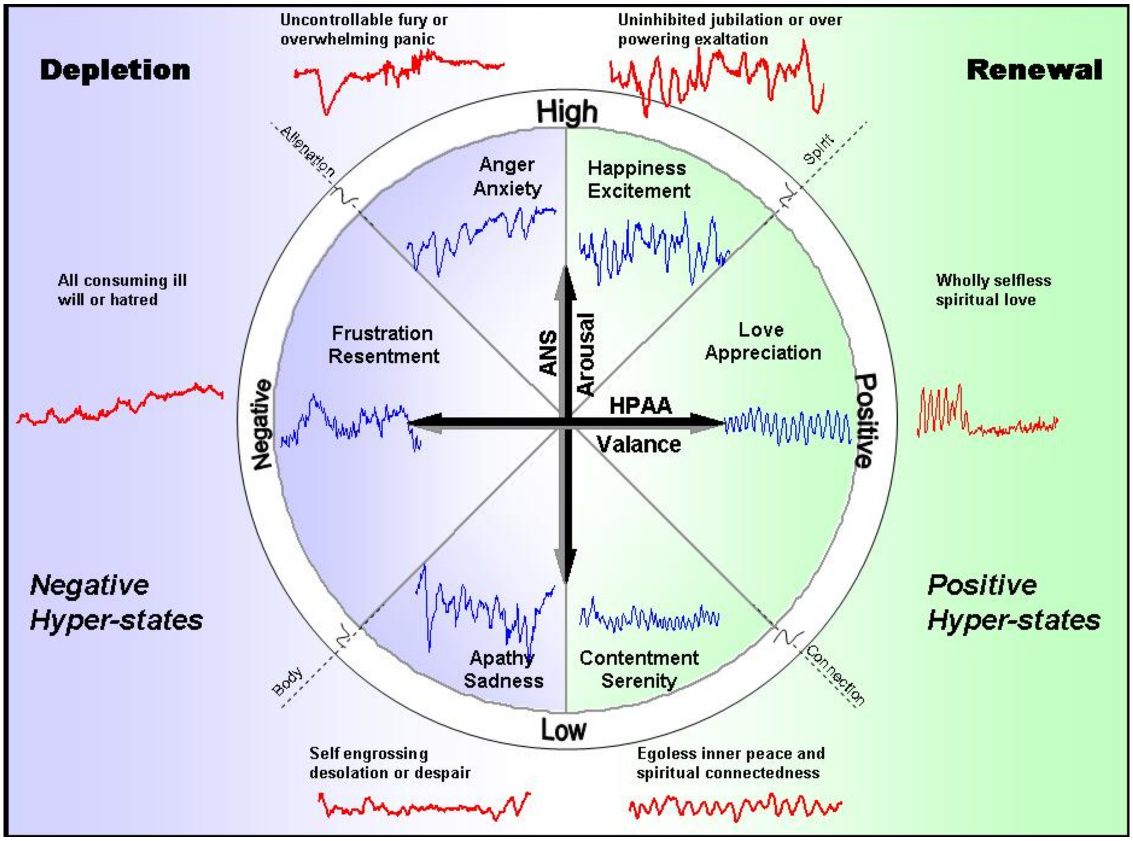
In short, our findings on psychophysiological coherence essentially substantiate what human beings have known intuitively for thousands of years: namely, that positive emotions not only feel better subjectively, but they also increase the synchronous and harmonious function of the body's systems. This optimizes our health, well-being, and vitality, and enables us to function with greater overall efficiency and effectiveness.

A Typology of Psychophysiological Interaction

In the Appendix A we identify six distinct patterns of HRV, which appear to denote six different modes of psychophysiological interaction. Four of these modes are readily generated in the context of everyday life. We have termed these *Mental Focus*, *Psychophysiological Incoherence*, *Relaxation* and *Psychophysiological Coherence*. Two further modes, *Emotional Quiescence* and *Extreme Negative Emotion*, are generated under more extraordinary life circumstances. This appendix provides empirical data and detailed descriptions for each of these.

Looking more closely at our data, we found a number of empirical clues that point to a more fundamental conceptualization of the relationship between HRV patterns (which include both heart rate and rhythm) and different emotional states. The first clue is that there is a general relationship between coherence and emotional valence, in that positive emotions are associated with physiological coherence and negative emotions with incoherence. The second clue is that, for certain emotions, we found a relationship between the morphology of the HRV waveforms and specific emotional states. The third finding of significance here is that we also found evidence of HRV waveform patterns (namely, those characteristic of the Emotional Quiescence and Extreme Negative Emotion modes) that appear to involve a rapid phase transition into a qualitatively different category of physiological function. In short, the empirical generalization suggested by these findings is that the morphology of HRV waveforms covaries with different emotional experiences.

Following the logic of this general relationship, we can thus use the six psychophysiological modes to construct a typology—a conceptual "map"—showing the expected relationship between different categories of subjective emotional experience and the different patterns of physiological activity associated with them (see Figure 4). This general theoretical scheme applies to normal, healthy individuals experiencing emotions and feelings of relatively short duration (minutes to hours).



Uncontrollable fury or overwhelming panic
Uninhibited jubilation or over powering exaltation
Depletion
Renewal
High
Alienation
Spirit
Anger Anxiety
Happiness Excitement
All consuming ill will or hatred
Wholly selfless spiritual love
Frustration Resentment
ANS
Arousal
Love Appreciation
Negative
HPAA
Valance
Positive
Negative Hyper-states
Positive Hyper-states
Apathy Sadness
Contentment Serenity
Body
Connection
Low
Self engrossing desolation or despair
Egoless inner peace and spiritual connectedness

Figure 4. Graphic depiction of everyday states and hyper-states of psychophysiological interaction distinguished by the typology. Two qualitatively different categories of psychophysiological interaction are depicted—the area within the inner circle represents the

range of emotional experience of “normal,” everyday life; the area beyond the outer circle represents psychophysiological hyper-states of extreme emotional experience. The psychophysiological transition from one region to another involves an abrupt phase transition, which is depicted graphically by the white space between the two circles. Two dimensions differentiate the varieties of emotional experience shown; for simplification, the relevant psychological and physiological variables are superimposed on the axis for each dimension. One dimension is the degree of *emotional arousal* (vertical axis, high to low)—known to be covariant with ANS balance. The second dimension is the *valence* of the emotion (horizontal axis, positive or negative)—assumed covariant with the degree of activation of the hypothalamic-pituitary-adrenal (HPA) axis. Different patterns of HRV are predicted from the particular combination of arousal and valence values on the two dimensions. Within the inner circle are six segments, each of which demarcates a range of emotion experienced in everyday life. Typical HRV patterns associated with each emotion are shown. The area beyond the outer circle depicts six hyper-states, in which intense emotional experience drives the activity of physiological systems past normal function into extreme modes. The known and predicted HRV waveform patterns associated with these hyper-states are also shown. The labels “Depletion” and “Renewal,” on the left and right-hand side of the diagram, respectively, highlight the relationship between the valence of feelings and emotions experienced and the psychophysiological consequences for the individual. Negative emotional states can lead to emotional exhaustion and depletion of physiological reserves. By contrast, positive emotional states are associated with increased psychophysiological efficiency and regeneration.

Although the mapping is not isomorphic between data and concept, the typology provides a compelling and fruitful way of conceptualizing and organizing these phenomena. In addition to offering some understanding of the relationships between different types of emotional experience and their associated physiological processes, this scheme also aims to *predict* the distinguishing physiological correlates of emotional states that, to our knowledge, have yet to be empirically described.

The typology distinguishes between two general classes of psychophysiological interaction. One class reflects “normal” psychophysiological states associated with the variety of subjective experiences of everyday life. This area is represented by the space within the inner circle shown in Figure 4. This area has been divided into six segments, each representing a different basic range of emotion. The second class is a qualitatively different category of psychophysiological interaction associated with extreme emotional experience, represented by the space beyond the outer perimeter of the circle in the figure. Because the patterns of psychophysiological interaction in this space are predicted to show an abrupt movement—a phase shift—from patterns associated with feelings typically experienced in everyday life to qualitatively distinct psychophysiological patterns associated with the experience of extreme positive or extreme negative emotions, well beyond the range of normal feelings, we have labeled them as *hyper*-states. Evidence of such a phase shift can clearly be seen as an abrupt reduction in amplitude and a corresponding increase in frequency in the waveform patterns showing the movement from Psychophysiological Coherence to the Emotional Quiescence, a positive hyper-state (Figure 9, Appendix A) and also in the movement from Psychophysiological Incoherence to Extreme Negative Emotion, a negative hyper-state (Figure 10, Appendix A).

Two dimensions common to the phenomenon of psychophysiological interaction provide the basis for differentiating varieties of emotional experience in the typology. As evident in the term "psychophysiological," there is a psychological element and a physiological element.[7] For purposes of simplification, we have superimposed the relevant psychological and physiological variables on the axis representing each dimension in the figure.[8] One dimension is the degree of *emotional arousal* (high to low), which is known to be covariant with ANS balance. Thus, during short-term emotional experiences, the relative balance between the activity of the sympathetic and parasympathetic branches of the ANS is driven by the degree of emotional arousal. Accordingly, we have mapped emotional arousal and ANS balance together on the vertical axis in Figure 4.

The second dimension is the *valence* (positive or negative) of the emotion, which is represented by the horizontal axis in Figure 4. Again for purposes of simplification, the valence is assumed to be covariant with the degree of activation of the hypothalamic-pituitary-adrenal (HPA) axis, which controls the release of cortisol. For short-term emotional experiences, there is an increase in cortisol during negative emotional states and a decrease in cortisol release during positive emotional states.

HRV patterns can be distinguished on the basis of amplitude, frequency, and degree of coherence. Empirical findings show that the two elements of the psychological dimension in our scheme play a predominant role in determining the characteristics of the HRV pattern. The amplitude of the HRV waveform is modulated by both the degree of emotional arousal (which corresponds to ANS activation) and emotional valence. In general, greater degrees of arousal within normal heart rate ranges produce waveforms of greater amplitude.[9] However, as heart rate increases, the amplitude of the HRV waveform decreases in linear relationship to heart rate until it reaches a point beyond which the amplitude of the HRV waveform is compressed. This is due to a biological constraint known as the cycle-length dependence effect. In terms of emotional valence, the amplitude of the HRV waveform increases during positive emotions, while it decreases during negative emotions. The frequency of the HRV waveform is influenced by the pattern of ANS activation; increased parasympathetic activity leads to higher-frequency (faster) changes in the heart rhythm, while increased sympathetic activity is associated with lower-frequency, higher-amplitude (slower) changes. Finally, the degree of coherence of the HRV waveform is largely determined by the emotional valence, with positive emotion increasing coherence and negative emotion decreasing coherence. Different patterns of HRV can therefore be predicted from the conjunction of the particular combination of arousal and valence values on the two dimensions in our typology.

---

[7] Although the psychological component involves at least three factors for a given emotional experience—emotional arousal, emotional valence, and the degree of cognitive engagement—we have excluded cognitive engagement to avoid the enormous complexity introduced when all three factors are considered simultaneously.

[8] In reality the relationship is much more complicated. While there is a close intra-relationship between each pair of variables on the axis, there are many life circumstances that give rise to a more complex interaction between the emotional and physiological levels.

[9] A secondary modulator of the HRV amplitude is the degree of cognitive engagement. High cognitive engagement tends to reduce HRV, while low cognitive engagement increases HRV. As noted, for purposes of simplification this factor is not considered in this model.

Following this logic, therefore, each of the six segments within the inner circle in Figure 4 demarcates a range of emotion and its corresponding representative HRV waveform patterns for the variety of emotional experiences that typify everyday life. Organized in terms of degree of arousal and valence, and rotating clockwise around the figure, these are the familiar emotions we experience from day to day. They are labeled: Happiness–Excitement, Love–Appreciation, Contentment–Serenity, Sadness–Apathy, Frustration–Resentment, and Anger–Anxiety. At the center of the circle, in a small area surrounding the intersection of the two axes, is the space of Emotional Impassivity (not labeled in Figure 4). Involving little or no emotional feeling, either positive or negative, emotional impassivity is typically experienced when the individual is mentally engaged in performing a familiar action or routine task. These seven areas within the circle of day-to-day emotional life denote substantively different emotions and feelings subjectively experienced by the individual.

Psychophysiological Hyper-States

Qualitatively distinct from the feelings of daily life are six distinct *psychophysiological hyper-states* reflecting the body's response to extreme emotions. Because these hyper-states involve a phase shift in physiological organization and psychological experience that is discontinuous from the states of normal, everyday emotional life, they are set apart beyond the perimeter of the outer circle in Figure 4.

Generally speaking, the psychophysiological hyper-states are indicative of two quite different directions of movement in bodily processes. As described below, hyper-states involving extreme positive emotions are transcendent states in which the individual's emotional experience involves the feeling of spiritual connectedness to something larger and more enduring beyond themselves. Typically these states are associated with selfless actions and are also generative of bodily renewal. By contrast, hyper-states of extreme negative emotions are all-consuming states of self-absorption and self-focus. These states are usually associated with highly destructive behavior—either directed at the self and/or projected out onto others—and have detrimental, even devastating, consequences. Negative hyper-states lead to a depletion of the body's energy and resources which, in the long term, results in the degeneration of bodily function.

Shown beyond the high end of the arousal axis are two states of hyper-arousal characterized by extreme emotional activation. The extreme emotional activation can result in a loss of self-control, which may lead to unpredictable behavior. It is important to understand that these extreme emotions are associated with the highest level of physiological activation. This drives the heart rate past physiological norms to such a degree that the amplitude of the HRV waveform becomes extremely low.

On the negative side, violent, uncontrollable anger and rage, or overwhelming fear and anxiety are the hyper-aroused emotions experienced here. As already mentioned, we have empirical data documenting the HRV pattern associated with this state (see the waveform pattern showing the movement to "intense anger" in Figure 10, Appendix A). On the positive side, uninhibited rejoicing and jubilation, or overpowering exaltation and ecstasy are predicted, in the absence of any empirical data documenting this hyper-state. We believe it is this psychophysiological state that is accessed during collective rituals that lead to trance states and spiritual rapture. It also may be possible to enter this state from hyper-aroused, uncontrolled positive emotions that induce a positive hysteria, such as can result from an unexpected, overwhelmingly positive event—for example, reuniting with a loved one who was in a life-threatening situation.

At the low end of the arousal axis are two states of hypo-arousal, the complement to the two states of hyper-arousal we have just described. On the positive side, the individual experiences an ego-less feeling of profound inner peace and deep spiritual connectedness. Typically, this state is accessed by self-disciplined meditative and spiritual practice. Physiologically, the emotional experience of this state of extremely low arousal is characterized by HRV waveform patterns of very low amplitude with some degree of coherence, reflecting the body’s state of complete calm and rest.

On the negative side, individuals can enter a state of hypo-arousal when they have been in an enduring negative emotional state (weeks to months). This is a state of self-engrossing desolation and despair and is accompanied by obsessive negative mental and emotional activity, such as that experienced in prolonged grief or long-term depression. However, an episode of severe trauma or negative emotion can rapidly propel an individual into this state. Either way, this can result in a depletion of physiological reserves, which is in turn reflected in a very low-amplitude HRV waveform. Often, individuals in this hypo-state are emotionally numb and socially alienated or withdrawn.

If this state is sustained on a long-term basis, there is further depletion of both the sympathetic and parasympathetic systems. In the first stages of this process, sympathetic activity becomes substantially reduced, resulting in an autonomic imbalance. As the process continues, parasympathetic activity (vagal tone) is correspondingly reduced. The process culminates with a phase-transition into exhaustion and breakdown.

Between the four states of extreme hyper-arousal and extreme hypo-arousal in the mid-range of emotional arousal, are two other states of extraordinary emotional experience. On the positive side, there is the state of wholly self-less spiritual love in which the individual experiences a deep feeling of all-embracing “big love”—*Agape*, as defined by the dictionary: a love that is open to and non-judgmental about all perceptions, cognitions, and intuitions. To enter this hyper-state requires a deep, heart-focused, self-less love, which can be associated with contemplative introspection. This hyper-state is accessed via a phase transition when this deep heart-focused introspection is sustained for a few minutes or more. This state is experienced as a substantial reduction in mental and emotional “chatter” to a point of internal quietness, often associated with a profound feeling of peace and serenity. This is the phase space within which the Emotional Quiescence mode falls. We also expect this hyper-state to be associated with other types of emotional experience that may have a spiritual dimension, such as those accessed by a number of introspective disciplines and practices.

Physiologically, there are two likely mechanisms to explain how this hyper-state occurs. One is that, in this state, the sympathetic and parasympathetic outflow from the brain to the heart is substantially reduced—reduced to such a degree that the amplitude of HRV waveform becomes very low. The other logical possibility is that the heart acts as an antenna to a field of information beyond space and time surrounding the body that directly informs the heart and modulates its rhythmic patterns. As astounding as this may sound, there is compelling evidence from our study of the electrophysiology of intuition that points in this direction (McCraty, Atkinson, & Bradley, 2004a, 2004b).

On the negative side, there is a hyper-state in which the individual is consumed by powerful malevolent feelings of extreme ill-will and hatred. These ego-centric feelings occupy virtually all of the individual's time and energy and engage one's whole attention. Typically, these feelings of evil and harm are not directed inwards against the self, but, instead, are projected outwards to be expressed as an intense pathological desire to cause great pain and suffering to others. Sustained, fanatical feelings of ill-will toward others can propel an individual into this hyper-state. Subjectively, there is a substantial reduction in mental and emotional "chatter" and a correspondingly heightened state of calm, malevolent feelings. The emotional calm reflects the individual's disassociation from the humanity of others and the total acceptance of the all-consuming negative thoughts and emotions experienced in this state. We expect this hyper-state to be one that can be entered by individuals who hold fanatical beliefs based on extreme negative stereotypes or caricatures of others. This is often the case with radical groups on the margins of society who see themselves suffering a great injustice or harm from the hands of those they hate.

Physiologically, this hyper-state likely involves a zombie-like state in which there is such emotional disassociation that the amplitude of HRV waveform becomes very low but with some variability spikes which may reflect the individual's momentary transitions between different emotions.

To conclude, the typology provides a more general conceptual framework from which to view the six modes of psychophysiological interaction we identified in our empirical studies. We have found the typology a useful way of conceptually organizing the broad range and highly variable phenomena in this domain. It will be up to future research to test the degree to which the typology offers a fruitful map of the nature and organization of the different types of emotional–physiological interaction.

Heart Coherence and Psychophysiological Function

So far, we have discussed how changes in the patterns of neural activity can encode and transmit information in the psychophysiological networks independent of changes in the amount of activity and how this level of information processing may well play a more fundamental role in information exchange than changes in the amount and/or intensity of neural activity. In this section we will see that increased coherence is associated with favorable changes in various aspects of physiological function, which in turn are associated with psychological benefits. We introduce this discussion by describing how the amount of information traveling through the afferent nerves increases during coherence, and we then examine the role that cardiac afferent input plays in the neural pathways involved in pain perception, respiratory function, emotional processing, and cognitive performance.

Vagal Afferent Traffic

The vagus nerve is a major conduit though which afferent neurological signals from the heart and other visceral organs are relayed to the brain. Psychophysiologist Paul Lehrer has shown that by using heart rhythm feedback to facilitate a state of physiological coherence (which he calls “resonance”), a lasting increase in baroreflex gain[10] is accomplished independent of respiratory and cardiovascular changes, thus demonstrating neuroplasticity of the baroreflex system (Lehrer et al., 2003). This shift in baroreflex gain indicates that with repeated episodes of coherence, the activation threshold of some of the mechanosensory neurons in the baroreflex system is reset and, as a result, these neurons increase their output accordingly.

In addition, a basic property of mechanosensory neurons is that they generally increase their output in response to an increase in the *rate of change* in the function they are tuned to (heart rate, blood pressure, etc.). During heart rhythm coherence, there is an increase in beat-to-beat variability in both heart rate and blood pressure, which is equivalent to an increase in the rate of change. This results in an increase in the vagal afferent traffic sent from the heart and cardiovascular system to the brain. With regular practice in maintaining the coherence mode, it is likely that increased vagal afferent traffic would also be observed even when one is not in this mode. This is due to the fact that the mechanosensory neurons’ threshold is reset as a result of the coherence-building practice, thus establishing a new baseline level of afferent traffic.

Generating an increase in vagal afferent traffic through noninvasive approaches such as heart-based emotion refocusing techniques and heart rhythm coherence feedback has a number of potential benefits. In recent years, a number of clinical applications for increasing vagal afferent traffic have been found; however, the increase in afferent activity is usually generated by implanted or external devices that stimulate the vagal afferent pathways, typically in the left vagus nerve. Vagal stimulation is an FDA-approved treatment for epilepsy and is currently under investigation as a therapy for obesity, depression, anxiety, and Alzheimer’s disease (Groves & Brown, 2005; Kosel & Schlaepfer, 2003). It has been established that an increase in the normal intrinsic levels of vagal afferent traffic inhibits the pain pathways traveling from the body to the thalamus at the level of the spinal cord (discussed below) and a recent study has found that stimulation of the afferent vagal pathways significantly reduces cluster and migraine headaches (Mauskop, 2005). Vagal nerve stimulation has also been shown to improve cognitive processing and memory (Hassert, Miyashita, & Williams, 2004)—findings that are consistent with those of several recent studies of individuals using heart rhythm coherence-building techniques (discussed later in this article).

---

[10] Baroreflexes are homeostatic reflexes that regulate blood pressure. Through them, increases in blood pressure produce decreases in heart rate and vasodilation, while decreases in blood pressure produce the opposite. Baroreflex gain is commonly calculated as the beat-to-beat change in heart rate per unit of change in blood pressure. Decreased baroreflex gain is related to impaired regulatory capacity and aging.

Pain Perception

Afferent signals from the heart modulate the neural pathways involved in the perception of pain. Numerous reports from individuals using the HeartMath coherence-building techniques indicate that they are able to greatly reduce their experience of bodily pain, often to a point where they can reduce or eliminate pain medications. This is true of both visceral and cutaneous pain. The HeartMath system is currently employed by numerous clinicians as a pain management aid, and has proven effective in patients with a wide range of conditions, including chronic joint pain, serious burns, and traumatic brain injury. The generation of increased vagal afferent activity during the coherence mode provides a likely mechanism to account for the reduction of pain associated with increased heart rhythm coherence.

Several mechanisms have been identified that explain how increased vagal afferent activity decreases pain sensitivity and increases pain threshold. Nociceptive information (pain signals) from the skin and internal organs is carried to cell bodies located in the dorsal root ganglia of the spinal cord. Axons from neurons in the dorsal root ganglia penetrate the spinal cord and convey afferent pain information to localized regions of the gray matter in the cord. From there, afferent information ascends in pathways to both the lateral and medial thalamus. Cells of the lateral thalamus in turn project to the primary somatosensory cortex, where the location, intensity, and duration of the painful stimulus are analyzed. Information is sent from the medial thalamus to the insular cortex, amygdala, and cingulate gyrus, where motivational-affective components of pain, including autonomic adjustments, occur. This pathway is called the spinothalamic tract (STT) and, although not the only pain pathway, it is the main and most studied system that transmits visceral sympathetic afferent pain information to the brain (Foreman, 1989).

Afferent fibers in the vagus nerve participate in the modulation of pain partly by modulating the flow of pain signals in the STT. An increase in afferent vagal activity causes a general inhibitory effect at most levels of the spinal cord on neurons that transmit nociceptive information to the thalamus and then to areas of the brain involved in pain perception. Vagal afferent fibers terminate primarily in the caudal medulla of the brain stem and nucleus tractus solitarius (NTS), and evidence shows that suppression of spinal neuronal activity is dependent upon the NTS connections. It has been demonstrated that the cardiac branch of the vagus nerve makes up the major contribution for the inhibitory responses on the spinal pain signals and that left vagal stimulation suppresses approximately 60% of the STT cells. Thus, the predominant effect of increased vagal afferent activity, which is associated with increased coherence, is the suppression of somatic and visceral input to STT cells, which provides a mechanism for decreasing pain (Foreman, 1994, 1997).

Respiration

It is well known that the respiratory rhythm modulates the pattern of the heart rhythm. This breath-related modulation of the heart rhythm is called respiratory sinus arrhythmia (RSA) (Hirsh & Bishop, 1981). RSA reflects the complex interaction of central respiratory drive, autonomic afferent signals, efferent outflow from the brain stem, and respiratory mechanics within the thorax. The phenomenon is dependent on the frequency and amplitude of respiration as well as on the underlying autonomic state of the organism.[11]

Since we have conscious control over our breathing, cognitively-directed breathing exercises can be used to *impose* a breathing rhythm on the heart rhythms. Thus, when we breathe at a slow, rhythmic rate (five seconds in and then five seconds out), we can facilitate coherence and entrainment. However, we do not normally think about our breathing. It is automatic; our breathing depth and rate varies without our conscious awareness due to changes in the inputs to the respiratory centers in the brain stem that control respiration.

Among these inputs is the afferent neurological information from the heart and cardiovascular system. Our breathing rate is affected by and often synchronized to the cardiac cycle, which means that changes in our heart rate and rhythm can affect our breathing rate and patterns.[12] During sleep or rest, coupling between the cardiac cycle and respiration is the strongest, and at times of stress, coupling between the heart and respiration becomes disrupted (Langhorst, Schulz, & Lambertz, 1986; Raschke, 1986a, 1986b; Turpin, 1986).

It is well established that changes in emotional states also alter breathing rates. Agitated states such as anger and frustration increase the breathing rate and reduce tidal volume (the depth of the breath), while positive emotional states slow the breathing rate and increase tidal volume. These emotion-related changes in breathing are likely to result, at least in part, from changes in input from the cardiovascular centers.

Because respiration modulates the heart rhythm, it can be intentionally used as a powerful intervention that can have quick and profound body-wide effects. As we have conscious control over our breathing rate and depth, we can consciously modulate the heart rhythm and thus change the afferent neural patterns sent to the brain centers that regulate autonomic outflow, emotion, and cognitive processes. Our experience with breathing exercises is that they are effective primarily due to the fact that they modulate the heart’s rhythmic patterns.

However, it is important to emphasize that coherence is associated with positive emotions *independent* of conscious alterations in one’s breathing rhythm. In our earlier studies, which were focused on the physiological correlates of different emotional states, instructions to subjects purposely made no mention of altering breathing rates or depths. We found that when sustained positive emotional states were maintained, increased heart rhythm coherence and entrainment between the heart rhythm, blood pressure rhythms, and respiratory rhythms emerged independent of any conscious alterations in breathing pattern (McCraty et al., 1995; Tiller et al., 1996).

---

[11] The effects of lung inflation are mediated by sensory neurons in the lungs that respond to stretch. These neurons increase their firing rate as the lungs expand upon inspiration. The output from these neurons travels to the brain stem and inhibits the parasympathetic outflow from the brain to the heart, resulting in an increase in heart rate. During expiration, the stretch is reduced and the inhibition is removed. The heart rate is quickly reduced. This interaction between the lungs and brain stem is only one source of RSA; however, it provides an easy way to conceptualize RSA.

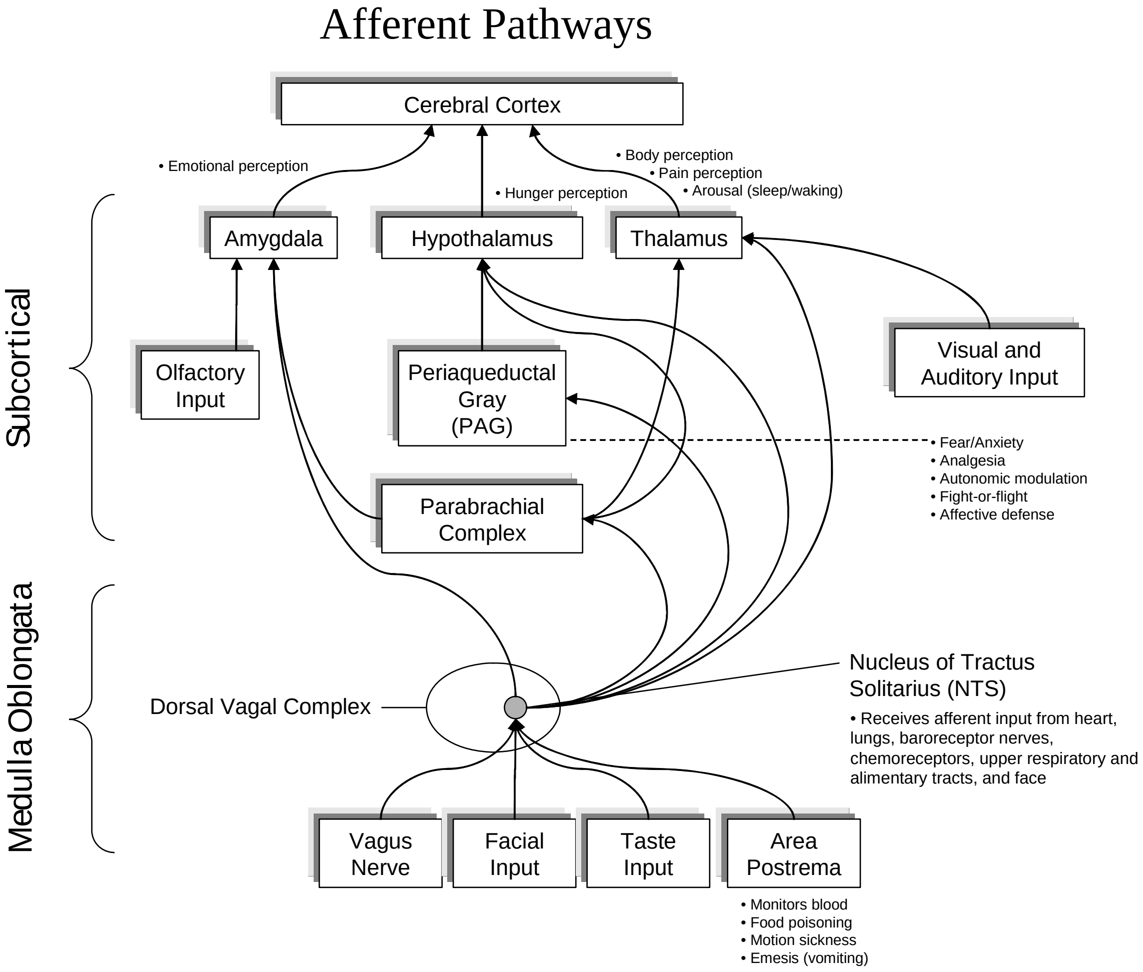
[12] The influence of afferent information from the heart on respiration was studied in great detail in the 1940s and 1950s. The cardiovascular afferent systems excite the respiratory centers, and if this input is inhibited, so is respiration. For a review of this earlier research, see Chernigovskiy (1967).

Although breathing techniques may sometimes facilitate a feeling shift, coherence that is driven through the use of such techniques alone does not necessarily shift one's emotional state. For example, it is possible to breathe at a rate of six breaths per minute (a 10-second rhythm) and still be feeling anxiety or other feelings of unease. In addition, many people find it difficult to consciously maintain breathing rates at a 10-second rhythm for more than about a minute. On the other hand, by focusing attention on self-generating a positive emotion while pretending to "breathe" this feeling through the area of the heart in a relaxed manner, smooth, coherent heart rhythm patterns occur naturally and are easier to sustain for longer periods of time. This has the added benefit of not only establishing coherence as the familiar pattern, but also strengthening the connection between the constituent physiological patterns of coherence—of which heart rhythm is key—and the positive feeling state.

Emotional Processing

Afferent input from the heart, and, in particular, the pattern of the heart's rhythm, also plays a key role in emotional experience. As described previously, our research suggested a fundamental link between emotions and changes in the *patterns* of both efferent and afferent autonomic activity, as well as changes in ANS activation, which are clearly reflected in changes in the heart rhythm patterns. The experience of negative emotions is reflected in more erratic or disordered heart rhythms, indicating less synchronization in both the activity of brain structures that regulate parasympathetic outflow and in the reciprocal action between the parasympathetic and sympathetic branches of the ANS. In contrast, sustained positive emotions are associated with a highly ordered or *coherent* pattern in the heart rhythms, reflecting greater overall synchronization in these same systems.

It is important to emphasize, however, that the heart's rhythmic beating patterns not only *reflect* the individual's emotional state, but they also play a direct role in *determining* emotional experience. At the physiological level, as shown in Figure 5, afferent input from the heart is conveyed to a number of subcortical regions of the brain that are involved in emotional processing, including the thalamus, hypothalamus, and amygdala. Moreover, cardiac afferent input has a significant influence on the activity of these brain centers (Adair & Manning, 1975; Cameron, 2002; Foreman, 1997; Frysinger & Harper, 1990; Oppenheimer & Hopkins, 1994; Zhang, Harper, & Frysinger, 1986). For example, activity in the amygdala has been found to be synchronized to the cardiac cycle (Frysinger & Harper, 1990; Zhang et al.). These understandings support the proposition that afferent information from the heart is directly involved in emotional processing and emotional experience.



Afferent Pathways
Cerebral Cortex
• Emotional perception
• Hunger perception
• Body perception
• Pain perception
• Arousal (sleep/waking)
Amygdala
Hypothalamus
Thalamus
Subcortical
Olfactory Input
Periaqueductal Gray (PAG)
Visual and Auditory Input
• Fear/Anxiety
• Analgesia
• Autonomic modulation
• Fight-or-flight
• Affective defense
Parabrachial Complex
Medulla Oblongata
Nucleus of Tractus Solitarius (NTS)
• Receives afferent input from heart, lungs, baroreceptor nerves, chemoreceptors, upper respiratory and alimentary tracts, and face
Dorsal Vagal Complex
Vagus Nerve
Facial Input
Taste Input
Area Postrema
• Monitors blood
• Food poisoning
• Motion sickness
• Emesis (vomiting)

Figure 5. Diagram of the currently known afferent pathways by which information from the heart and cardiovascular system modulates brain activity. Note the direct connections from the NTS to the amygdala, hypothalamus, and thalamus. Although not shown, there is also evidence emerging of a pathway from the dorsal vagal complex that travels directly to the frontal cortex.

These findings and those from our own research led us to ponder the fundamental physiological significance of the covariance between the heart's rhythms and changes in emotion. This question was especially intriguing in light of current views in neuroscience that the contents of feelings are essentially the configurations of body states represented in somatosensory maps (Cameron, 2002; Damasio, 2003). This was of course the essence of the theory of emotion first proposed by William James (1884), which has been refined by many researchers over the years.

A useful way of understanding how the heart is involved in the processing of emotional experience is to draw on Pribram's theory of emotion (Pribram & Melges, 1969). In this theory, the brain is viewed as a complex pattern identification and matching system. Pribram's basic concept is that of a "mismatch" between familiar input patterns and current input patterns that are different or novel. It is this mismatch that provides the mechanism by which feelings and emotions are generated.

According to Pribram’s model, past experience builds within us a set of familiar patterns, which are instantiated in the neural architecture. Inputs to the brain from both the external and internal environments contribute to the maintenance of these patterns. Within the body, many processes provide constant rhythmic inputs with which the brain becomes familiar. These include the heart’s rhythmic activity; digestive, respiratory and hormonal rhythms; and patterns of muscular tension, particularly facial expressions. These inputs are continuously monitored by the brain and help organize perception, feelings and behavior.

Familiar input patterns form a stable backdrop, or reference pattern, against which new information or experiences are compared. When an input pattern is sufficiently different from the familiar reference pattern, a *“mismatch”* occurs. This mismatch, or *departure from the familiar pattern*, is what underlies the generation of feelings and emotions. In physiological terms, Pribram suggests that the low-frequency oscillations generated by the heart and bodily systems are the carriers of emotional information, and that the higher frequency oscillations found in the EEG reflect the integration, perception, and labeling of these body states along with perception of sensory input from the external environment. The mismatch between a familiar pattern and a pattern that is new or novel in either of these informational inputs is what activates emotional changes (McCraty, 2003; McCraty & Tomasio, 2006).

Although inputs originating from many different bodily organs and systems are involved in the processes that ultimately determine emotional experience, it is now abundantly clear that the heart plays a particularly important role. The heart is the primary and most consistent source of dynamic rhythmic patterns in the body. Furthermore, the afferent networks connecting the heart and cardiovascular system with the brain are far more extensive than the afferent systems associated with other major organs (Cameron, 2002). Additionally, the heart is particularly sensitive and responsive to changes in a number of other psychophysiological systems. For example, heart rhythm patterns are continually and rapidly modulated by changes in the activity of either branch of the ANS, and the heart’s extensive intrinsic network of sensory neurons also enables it to detect and respond to variations in hormonal rhythms and patterns (Armour, 1994). In addition to functioning as a sophisticated information processing and encoding center, (Armour & Kember, 2004) the heart is also an endocrine gland that produces and secretes hormones and neurotransmitters (Cantin & Genest, 1985, 1986; Gutkowska, Jankowski, Mukaddam-Daher, & McCann, 2000; Huang et al., 1996; Mukoyama et al., 1991). As we will see later, with each beat, the heart not only pumps blood, but also continually transmits dynamic patterns of neurological, hormonal, pressure, and electromagnetic information to the brain and throughout the body. Therefore, the multiple inputs from the heart and cardiovascular system to the brain are a major contributor in establishing the dynamics of the familiar baseline pattern or set point against which the current input of “now” is compared.

A striking example illustrates the extensiveness of the influence of cardiac afferent input on emotional experience as well as the operation of the mismatch mechanism. Research shows that psychological aspects of panic disorder are actually frequently created by an unrecognized cardiac arrhythmia. One study found that DSM-IV criteria for panic disorder were fulfilled in more than two-thirds of patients with sudden-onset arrhythmias. In the majority of cases, once the arrhythmia was discovered and treated, the symptoms of panic disorder disappeared (Lessmeier et al., 1997). When the heart rate variability patterns of such an arrhythmia are plotted, the erratic, incoherent waveform appears quite similar to the heart rhythm pattern produced during strong feelings of anxiety in a healthy person. Because the sudden, large change in the pattern of afferent information is detected by the brain as a mismatch relative to the stable baseline pattern to which the individual has adapted, it consequently results in feelings of anxiety and panic.

The above example illustrates the immediate and profound impact that changes in the heart's rhythmic activity can have on one's emotional experience. In this example—as is usually the case—such changes occur unconsciously. One of the most important findings of our research, however, is that changes in the heart's rhythmic patterns can also be *intentionally generated*. This shift in the heart's rhythmic patterns is one of the physiological correlates of using the HeartMath positive emotion-based coherence-building techniques, which couple an intentional shift in attention to the physical area of the heart with the self-induction of a positive emotional state. We have found that this process rapidly initiates a distinct shift to increased coherence in the heart's rhythms. This, in turn, results in a change in the pattern of afferent cardiac signals sent to the brain, which serves to *reinforce* the self-generated positive emotional shift, making it easier to sustain. Through the consistent use of the coherence-building techniques, the coupling between the psychophysiological coherence mode and positive emotion is further reinforced. This subsequently strengthens the ability of a positive feeling shift to initiate a beneficial physiological shift towards increased coherence, or a physiological shift to facilitate the experience of a positive emotion.

While the process of activating the psychophysiological coherence mode clearly leads to immediate benefits by helping to transform stress in the moment it is experienced, it can also contribute to long-term improvements in emotion regulation abilities and emotional well-being that ultimately affect many aspects of one's life. This is because each time individuals intentionally self-generate a state of psychophysiological coherence, the "new" coherent patterns—and "new" repertoires for responding to challenge—are reinforced in the neural architecture. With consistency of practice, these patterns become increasingly familiar to the brain. Thus, through a feed-forward process, these new, healthy patterns become established as a new baseline or reference, which the system then strives to maintain. It is in this way that HeartMath tools facilitate a *repatterning process*, whereby the maladaptive patterns that underlie the experience of stress are progressively replaced by healthier physiological, emotional, cognitive, and behavioral patterns as the "automatic" or familiar way of being (McCraty & Tomasio, 2006).

Coherence and Cognitive Performance

It is now generally accepted that the afferent neurological signals the heart sends to the brain have a regulatory influence on many of the ANS signals that flow from the brain to the heart, to the blood vessels, and to other glands and organs. However, it is less commonly appreciated that these same cardiovascular afferent signals involved in physiological regulation *also* cascade up into the higher centers of the brain and influence their activity and function. Of particular significance is the influence of the heart's input on the activity of the cortex—that part of the brain that governs thinking and reasoning capacities. As we will see, depending on the nature of the heart's input, it can either inhibit or facilitate working memory and attention, cortical processes, cognitive functions, and performance (Hansen, Johnsen, & Thayer, 2003; Lacey & Lacey, 1974; Rau, Pauli, Brody, Elbert, & Birbaumer, 1993; Sandman, Walker, & Berka, 1982; van der Molen, Somsen, & Orlebeke, 1985).

Our research on psychophysiological coherence has provided new insight into the relationship between heart activity and cognitive performance. The context for this is described in detail in Appendix B. It describes how psychophysiologists John and Beatrice Lacey's baroreceptor hypothesis identified a relationship between the heart's activity and cognitive performance. This work was furthered by Christoph Wölk and Manfred Velden in Germany, who identified the importance of heart rate's *pattern* and *stability* in influencing neurological functioning. Although we agree with Wölk and Velden's conclusions, the primary focus of previous work in this area has been on *micro-scale* temporal patterns of cardiac activity, occurring within a single cardiac cycle, or, at most, across 3–4 heartbeats. However, the interactions between the heart and brain are much more complex and also occur over longer time periods (sequences of heartbeats occurring over seconds to minutes). Based on the evidence we report below, we believe that patterns of the heart's rhythmic activity over a longer time scale are also involved in influencing cognitive performance. Moreover, it appears that these *macro-scale* temporal patterns of cardiovascular afferent activity can have a much greater effect on performance than micro-scale patterns. Therefore, a broader hypothesis is called for.

The Heart Rhythm Coherence Hypothesis: A Macro-Scale Perspective

In the course of conducting our studies, we had received numerous reports from individuals able to maintain the psychophysiological coherence mode that their performance in various activities had noticeably improved. These involved faculties and abilities requiring the processing of external sensory information (e.g., speed and accuracy, coordination, and synchronization, such as in sports and the performing arts) as well as processes requiring primarily internal focus (e.g., problem solving, decision making, creativity, and intuition, such as in business and intellectual activities). This led us to postulate that psychophysiological coherence and the associated *macro-scale* patterns of the temporal organization of the heart's rhythmic activity—heart rhythm patterns occurring over seconds to minutes—also have an important effect on cognitive processes and intentional behavior. Focusing on the nature of the organization of the heart's rhythmic activity, which reflects emotional state, we hypothesize that emotion-driven changes in global psychophysiological function, and the resulting change in the pattern of heart rhythm activity, are also directly related to the facilitation or inhibition of the brain processes involved in cognitive function. In specific terms, sustained positive emotions induce psychophysiological coherence, which, in turn, is reflected in increased heart rhythm coherence. Thus, the greater the degree of emotional stability and system-wide coherence, the greater the facilitation of cognitive and task performance. We call this hypothesis the *heart rhythm coherence hypothesis*.

A number of research projects have been carried out to test this hypothesis. Appendix C describes three studies that show evidence supporting the hypothesis. The first showed that macro-scale patterns of cardiac activity can produce a larger effect on the inhibition/facilitation of cognitive performance than the much smaller inhibition/facilitation fluctuations in performance observed by Wölk and Velden. It found an approximately *six times* greater improvement in performance than previous studies involving similar methods. The second was an independent study conducted in the UK by Dr. Keith Wesnes, who concluded that learning and practicing the HeartMath positive emotion-focused coherence-building techniques appears to enhance an individual’s memory capacity and also improves self-reported calmness. The third study was funded by the U.S. Department of Education and carried out with the cooperation of the Claremont Graduate University’s School of Educational Studies involving tenth grade students in two large California high schools. It found significant reduction in test anxiety as well as higher test scores for students who learned the positive emotion-focused coherence-building techniques in the TestEdge program.

Overall, the evidence provided by the three studies described in Appendix C indicates that a specific macro-scale pattern of cardiac activity—heart rhythm coherence—is associated with significant improvement in cognitive performance. Not only is this outcome observed in a simple reaction time experiment, but the data suggest that this facilitative effect also extends across more complex domains of cognitive function, including memory and even academic test performance. It also appears that the influence of the coherence mode on cognitive performance is substantially larger in magnitude than that previously documented for changes in cardiac activity patterns on a micro scale.

Assuming these results are validated by other researchers, it is worth considering the likely pathways and mechanisms that could explain these findings. This entails developing an explanation that complements the micro-pattern hypotheses of the Laceys and Wölk and Velden, by identifying other physiological mechanisms that may account for these results. The micro-pattern hypothesis presents a somewhat simplified view of heart–brain interactions, which is not adequate to describe the full range of information communication that takes place between the heart and brain: it only addresses the smaller fluctuations in performance that are associated with physiological changes occurring within a single cardiac cycle or across several heartbeats. As we have seen, however, there are macro-scale temporal patterns that have a significant carry-over effect on cognitive performance. To build an adequate understanding of the physiological mechanisms involved requires developing a deeper understanding of the complexity of heart–brain interactions. This is reflected in the discussion below in three primary ways: first, that the influence of cardiovascular afferent input on the brain is more elaborate than that considered in the micro-pattern hypothesis; second, that afferent input from the heart has effects on brain centers other than the thalamus; and third, that the alpha rhythm is not the only brain rhythm synchronized to the heart.

A More Complex Picture

Complexity of Cardiac Afferent Signals

One of the underlying assumptions of the micro-pattern hypothesis is that there is a one-to-one correspondence between each heartbeat and the burst of neural activity sent to the brain from the cardiac mechanosensory neurites. However, at the level of the macro-scale heart–brain interactions investigated here, the dynamics of the generation and transmission of cardiovascular afferent input involve many types of neurons and a multiplicity of pathways operating over different time scales.

There are approximately 40,000 sensory neurites in the human heart involved in relaying afferent information to the brain. Of these, just 20% are mechanosensory neurons. Of this 20%, only a small proportion actually fire in unison with each heartbeat. Moreover, there are at least five different types of mechanosensory neurons. Almost all mechanosensory neurons are sensitive to rate of change, in that their activity levels increase in a nonlinear manner in response to change in the system. Some increase their firing rate only when blood pressure decreases, while others increase only during pressure increases. Still others are only sensitive to large movements in the rate of change of heart rate or blood pressure (Armour & Kember, 2004). Thus, there is only a minority of sensory neurites whose output activity exhibits a one-to-one relationship to the heartbeat and regional changes in ventricular blood pressure.

To add to the complexity, the heart's intrinsic nervous system has both short-term and long-term memory that affects cardiac function (and thus afferent signals) over two different time scales: (1) variations in activity patterns that occur in response to rapidly occurring alterations in local mechanical status over milliseconds; and (2) variations in activity patterns of a global nature that operate over time scales of seconds to minutes (Armour, 2003; Armour & Kember, 2004). Thus, in addition to the information related to a single cardiac cycle, there is also rhythmic information occurring over longer time scales that may modulate brain activity. The fact that many of the neurons respond primarily to rate of change, and that changes in activity patterns can last for minutes, are important factors in understanding how heart–brain interactions are affected during coherence and can have an extended carry-over effect. This is because in the coherence mode there is an increased rate of change in beat-to-beat variability of both heart rate and blood pressure, in addition to the increased order in the temporal patterns of activity of the cardiovascular system. While it is likely, under normal pressure variations and heart rates, that the overall *amount* of afferent neural activity reaching the brain is the same or nearly the same from one heartbeat to the next, it is our contention that the *macro-scale patterns* of neural activity can be quite different.

In this regard, Wölk and Velden made an important observation in noting that the *frequency* and *stability* of the afferent input were important factors affecting sensory-motor performance (Wölk and Velden, 1989). In this context, however, we suggest that the concept of *activity pattern* is more appropriate than the concept of *frequency*. This is because it is in the interspike interval (the temporal space *between* consecutive spikes of the neural activity) that information is encoded. Thus, it is the overall pattern of activity and *not* merely its frequency that contains the meaning of the information enfolded in the signals. Furthermore, we consider the stability of the pattern over longer time scales, those of seconds to minutes. Therefore, to understand the effects of cardiovascular afferent signals on the brain, the heart's rhythmic pattern over longer time scales must also be considered as an important factor in itself, in addition to those of stimulus intensity, heart rate, and pressure. As we have seen, it is likely that the macro-scale pattern of the heart's activity may have a much greater effect on performance than the within-cardiac cycle effects.

Afferent Input to Brain Centers other than the Thalamus

Another important consideration, in relation to heart–brain interactions, is that while the micro-pattern model focuses solely on cardiovascular input to the thalamus, there are other neural pathways by which the heart's input can modulate cortical activity and thus performance. As shown in Figure 5, cardiovascular inputs from the vagal afferent nerves first reach the nucleus of tractus solitarius (NTS) and from there travel directly to the parabrachial complex, periacqueductal grey, thalamus, hypothalamus, and amygdala. There are then connections by which the afferent inputs move from the amygdala, hypothalamus, and thalamus to the cerebral cortex. There is also evidence to suggest the existence of afferent pathways from the medulla directly to the prefrontal cortex (McCraty et al., 2004b).

Although this diagram primarily shows the afferent pathways—one-way flow of input to the brain—in most cases the regions are reciprocally interconnected such that information flows in both directions. This reciprocally interconnected network allows for continuous positive and negative feedback interactions and the integration of autonomic responses with the processing of perceptual and sensory information. In addition, the numerous distributed parallel pathways permit multiple avenues to process a given response.

Heart–Brain Synchronization

The third way in which the picture is more complicated is that whereas Wölk and Velden's hypothesis considers only the alpha rhythm, there are other brain rhythms that are also synchronized to the heart. These include the beta rhythm as well as lower frequency brain activity. Thus, it is likely that the effects of macro-scale cardiovascular dynamics on other aspects of brain activity are also important in contributing to larger fluctuations in performance, such as those observed in the studies reported here.

Appendix D presents evidence from a number of studies confirming that a significant amount of alpha rhythm activity is indeed synchronized to the activity of the heart. We have also presented additional evidence showing that Wölk and Velden's contention appears to have an empirical basis, in that we found that the alpha rhythm is synchronized to the cardiac cycle. Moreover, our evidence suggests that alpha synchronization increases during psychophysiological coherence and that other brain rhythms—namely, the beta rhythm and lower frequency brain activity—also appear to be synchronized to the cardiac cycle.

System Dynamics: Centrality of the Heart in the Psychophysiological Network

To this point our concern has been describing the nature, organization, and measurement of six different psychophysiological modes. In particular we have focused on the psychophysiological coherence mode and its impact on various aspects of psychophysiological function, including pain perception, respiration, emotional processing, and cognitive performance. Now we turn to the basic question of system dynamics: how the heart, as the most powerful generator of rhythmic information patterns in the body, acts effectively to bind and synchronize the entire system. This helps explain the mechanisms that underlie the heart's role in the generation of system-wide coherence in the body as a whole. In addition to an overview of research in these areas, we also present our own findings, which, so far as we know, represent an original contribution.

A Systems Approach

Complex living systems, such as human beings, are composed of numerous interconnected, dynamic networks of biological structures and processes. The recent application of systems thinking in the life sciences has given rise to the understanding that the function of the human organism as an integrated whole is determined by the multi-level interactions of all the elements of the psychophysiological system. The elements influence one another in a network fashion rather than through strict hierarchical or cause-effect relationships. Thus, any node within the psychophysiological network—any organ, system, substance, or process—necessarily exerts an impact, whether pronounced or subtle, on the functioning of the system as a whole. And while certain nodes have a greater influence than others in a given network at a particular level of system organization, those nodes that constitute multi-level linkages across different subsystems and scales of organization will have a greater influence on the system as a whole. Abundant evidence indicates that proper coordination and synchronization—i.e., coherent organization—among the lateral and vertical networks of biological activity generated by these structures and subsystems is critical for the emergence of higher-order functions.

As we have seen thus far, one of the primary ways that information is encoded and communicated throughout our psychophysiological systems is in the language of dynamic patterns. In the nervous system, for example, it is well established that information is encoded in the *time interval between action potentials*—and, on a macro-scale, in the intervals between bursts of neural activity. Likewise, in the endocrine system, patterns of “pulses” of hormone release are used to convey biologically relevant information. This is an important principle of operation, as it appears that the body uses this same encoding and transmission strategy—encoding information in the time intervals between pulses of activity—in many systems and across very different time scales. This is biologically efficient in that the body is organized to use a common information communication mechanism across multiple systems.

There is substantial evidence that the heart plays a unique role in synchronizing the activity in multiple systems of the body and across different levels of organization, and thus in orchestrating the flow of information throughout the psychophysiological network. As the most powerful and consistent generator of rhythmic information patterns in the body, and possessing a far more extensive communication system with the brain than other organs, the heart is in continuous connection with the brain and other bodily organs and systems through multiple pathways: *neurologically* (through the transmission of neural impulses), *biochemically* (through hormones and neurotransmitters), *biophysically* (through pressure and sound waves), and *energetically* (through electromagnetic field interactions).

As we discuss each of these main communication pathways in more detail, it will become clear that the heart is a central node in the psychophysiological network that influences multiple systems, and is thus uniquely positioned to integrate and communicate information both across systems and throughout the whole organism. Because of the extensiveness of the heart’s influence on the physiological, cognitive, and emotional systems, the heart provides a point of access from which the dynamics of bodily processes can be quickly and profoundly affected. From this perspective, we will also see how intentional interventions that increase coherence in the heart’s rhythms can facilitate a rapid shift to the psychophysiological coherence mode, with profound system-wide consequences.

In the light of these ideas, we can now postulate that information relative to global-scale integration (the organization and function of the body as whole) is encoded in the interbeat intervals of the heartbeat. Thus, the heart effectively acts as the central “conductor” of rhythmic activity in the body: the neural, hormonal, biophysical, and energetic patterns generated by the heart’s rhythmic activity provide a global synchronizing signal for the system as a whole.

Neurological Interactions

Of all the organs in the body, the heart has the most extensive neural connection with the brain. Until relatively recently, much attention in biology has been focused on understanding how the brain regulates all organs in the body, including the heart. However, as discussed above, more recent understandings have begun to portray quite a different picture, in which the heart actually exerts a significant influence on the brain. In this section we describe the various ways in which the heart affects the brain and body via neurological pathways, and we examine in particular its influence on the activity and function of higher brain centers and processes. In order to understand this heart–brain relationship, it is necessary, first, to review some recent findings of how the brain processes information and how the organization of neurological activity is critical to brain function. This organization can be described in terms of the three concepts of coherence introduced at the beginning of this article: coherence as global order, as autocoherence, and as cross-coherence.

Coherence Within the Brain

The brain is often analogized to the functions of a computer. But in terms of information processing and computation the brain is nothing like a digital computer. It does not assemble thoughts and feelings from digitized bits of serial data. Rather, the brain is more like an analog processor that relates whole patterns and concepts to one another; it looks for similarities, differences, or relationships between them. The brain is a highly efficient processor and analyzer of information that is exquisitely sensitive to novelty—to rate of change and to the difference between patterns.

At the macro-level of organization, global coherence must be present in order for the brain and nervous system to function efficiently and effectively. This means that the neural activity, which encodes information, must be stable and coordinated. It also means that the various centers within the brain must be able to dynamically synchronize their activity in order for information to be smoothly processed and perceived.

For example, autocoherence and cross-coherence in the electrical activity of diverse regions of the brain are necessary for sensory perception to occur. Our “coherent” perception of an object in the external world actually comes from millions of units of fragmented sensory information that are made globally coherent by being brought together and organized into a single conscious experience.

A depiction of such macro-scale organization of neural activity is offered by studies using the electroencephalogram (EEG), which measures macro-scale activity occurring in the dendritic fields of the neurons. These fields reflect excitatory or inhibitory synaptic action over a large number of neurons. (A single scalp electrode provides estimates of synaptic action averaged over tissue masses containing between 10 million and 1 billion neurons.) There is a voluminous literature concerning the relations between the different brain rhythms found in the EEG and the many different aspects of cognition.[13] For example, the alpha rhythm amplitude is lower during mental calculations while the beta rhythms increase (Nunez, 2000).

Recent research has focused on the global organization of cooperative workings of local and regional cell groups in order to better understand the brain's dynamic complexity. At an operational level, coherence in this context is a specific quantitative measure of functional relations between paired locations. In general, this research has shown that separate regions in the brain can exhibit high coherence in specific frequency bands and, at the same time, low coherence in other bands. The resulting correlated activity between these brain regions is cross-coherence, which is thought to emerge either from direct neural connections between the regions, common input from the thalamus and other neocortical regions, or both (Nunez, 2000). However, cross-coherence also occurs between distant cortical structures that are not necessarily interconnected anatomically (Bressler, Coppola, & Nakamura, 1993). This raises the question of what other mechanisms might account for this communication among distant brain regions.

A notable example of such cross-coherence has been described by Rodolfo Llinas, Chief of Physiology and Neuroscience at the New York University School of Medicine. He observed that specific areas of the cortex emit a steady oscillation, at a frequency of around 40 cycles per second (40 Hz). He also found that remote areas of the cortex were phase-locked at this 40-Hz frequency, meaning that the waves they produced all oscillated in synchrony. This led Llinas and others to suggest that the neurons perform in synchrony because they follow a kind of conductor (Ratey, 2001).

The prime candidate for the brain's internal conductor is the many intralaminar nuclei, located within the thalamus. These nuclei receive and project long axons to many areas of the brain. They take in information, reply to it, and monitor the responses to their replies, thus creating elaborate feedback loops in which resonant activity (~40 Hz) is modified by incoming sensory input. If the intralaminar nuclei are damaged, the person enters a deep and irreversible coma. Indeed, it appears that it is only when the "conductor" synchronizes the brain's activity that we become conscious. When this happens with a sufficient number of neural networks, the oscillations become ordered and globally coherent. As they spread their influence, recruiting more networks to join them, consciousness arises (Ratey, 2001).

The thalamus appears to play an active role in the generation of all the global EEG rhythms, and it should be emphasized that phase synchrony has been shown to occur in all the frequency bands found in the EEG, not just in the 40 Hz band.[14] For example, different types of synchronization occur in the alpha band during the different phases of memory processes (encoding and retrieval) (Fingelkurts, Krause, Kaplan, Borisov, & Sams, 2003), and cross-coherence increases in the theta band during mental calculations (Nunez, 2000). Coherence in the alpha band is also correlated to perceptual and decision-making processes, and it increases in the frontal cortex during task processing (Kolev, Yordanova, Schurmann, & Basar, 2001).

---

[13] The main rhythms that have been identified are: the delta rhythm (0–4 Hz), the theta rhythm (4-8 Hz), the alpha rhythm (8-12 Hz), the beta rhythm (12-16 Hz), and most recently the gamma rhythm (~ 40 Hz).

The organization of the many interconnected neural networks within the brain allows for maximal flexibility in adapting to changing demands, such as focus on an external sensory input or an internal process. However, the degree of coupling, which regulates synchronized activity in the network, varies depending on the needs of the moment. When the network is either excessively coupled or is too loosely coupled, the system is less able to dynamically recruit the appropriate neural support systems it needs to respond to a particular demand. For example, the alpha rhythm increases in amplitude and distribution when the neural populations in the brain are more tightly coupled, which occurs when the brain regions involved are not processing information. Under these circumstances cognitive performance is reduced, especially that involving the processing of external sensory information. In terms of optimizing performance, this means in general that one should not be too relaxed (increased coupling) or overly stimulated (decreased coupling). Thus, in the light of the results of our studies of cognitive performance and heart-brain synchronization discussed above, the psychophysiological coherence mode appears to be a condition under which optimal coupling, and thus improved performance, occurs across diverse systems in the body.

Relevant to this discussion are the findings from a recent study of long-term Buddhist practitioners. This study found that while the practitioners generated a state of “unconditional loving-kindness and compassion,” increases in gamma band oscillation and long-distance phase synchrony were observed (Lutz, Greischar, Rawlings, Ricard, & Davidson, 2004). The study’s authors suggest that the large increase in gamma band synchrony reflects a change in the quality of moment-to-moment awareness. Moreover, because the characteristic patterns of *baseline* activity in these long-term meditators were found to be different from those of a control group, the results suggest that an individual’s baseline state can also be altered with long-term practice.

The authors of this study describe the Buddhist meditation as an “objectless meditation” in which the practitioners do not directly attend to a specific object or the breath, but focus instead on cultivating a feeling of “unconditional loving-kindness and compassion.” In many ways, the focus of this practice is comparable to the focus of the Heart Lock-In technique of the HeartMath system. It would therefore be interesting to investigate whether HeartMath practitioners, when in a state of psychophysiological coherence, also produce the increases in gamma-band oscillation and long-distance phase-synchrony observed in this study. Although this study did not measure heart rhythm coherence, another study of Buddhist monks using the same meditative focus of “loving-kindness and compassion” found an increase in heart rhythm coherence during this practice (Rapgay, n.d.). Because these studies were both conducted with samples of Buddhist monks who were practicing the same meditative focus, this raises the possibility that heart rhythm coherence and increased gamma-band phase synchrony are linked in a deeper way. This is consistent with the hypothesis that heart rhythm coherence reflects a state of increased global coherence in the body’s function as a whole.

---

[14] The electroencephalogram (EEG) provides a very large-scale measure of the activity occurring in the dendritic fields of the neurons. These fields reflect the excess of excitatory or inhibitory synaptic action over a large number of neurons. A single scalp electrode provides estimates of synaptic action averaged over tissue masses containing between 10 million and 1 billion neurons. Synchronizations of oscillatory neural discharges are thought to play a crucial role in the constitution of transient networks that integrate distributed neural processes into highly ordered cognitive and affective functions that can induce synaptic changes.

In summary, the mechanisms that underlie the source of oscillatory rhythms in the thalamus are complex, and there are a number of different hypotheses concerning these. The mechanisms responsible for the synchronization of remote cells in the brain are even more complex, as there are both local and global levels of synchronization and also interactions between the local and global levels. Whatever the mechanisms turn out to be that facilitate synchronous activity in remote cell assemblies, it is clear that the *input from the heart* to the brain affects the activity of the thalamus and its ability to synchronize cortical activity. This is important in understanding the relationship between global coherence, emotional stability, and optimal performance.

More Than a Pump

Over the past several decades, several lines of scientific evidence have established that, far more than a mechanical pump, the heart functions as a sensory organ and as a complex information encoding and processing center. Groundbreaking research in the relatively new field of neurocardiology has demonstrated that the heart has an extensive intrinsic nervous system that is sufficiently sophisticated to qualify as a “little brain” in its own right. Pioneer neurocardiology researcher Dr. J. Andrew Armour first described the anatomical organization and function of the heart brain in 1991 (Armour, 1991). Containing over 40,000 neurons, its complex circuitry enables it to sense, regulate, and remember. Moreover, the heart brain can process information and make decisions about cardiac control independent of the central nervous system (Armour, 2003; Armour & Kember, 2004).

The heart brain senses hormonal, heart rate, and blood pressure signals, translates them into neurological impulses, and processes this information internally. It then sends the information to the central brain via afferent pathways in the vagus nerves and spinal column. When different hormones or neurotransmitters in the bloodstream are detected by the sensory neurites in the heart, the pattern in the afferent neural output sent to the brain is modified (Armour, 1994). In other words, in addition to its better-known functions, the heart is also a sensory center that detects and transmits information about the biochemical content of the regional blood flow.

Neurological signals originating in the heart have an important and widespread influence in regulating the function of organs and systems throughout the body. For example, it is now known that in addition to modulating the activity of the nervous and endocrine systems, input from the heart influences the activity of the digestive tract, urinary bladder, spleen, respiratory and lymph systems, and skeletal muscles (Chernigovskiy, 1967). In more specific terms, cardiovascular afferent signals regulate efferent ANS outflow, (Grossman, Janssen, & Vaitl, 1986) modulate pain perception (Randich & Gebhart, 1992) and hormone production (Drinkhill

& Mary, 1989), and influence the activity of the locus coeruleus and that of the pyramidal tract cells in the motor cortex (Coleridge et al., 1976; Svensson & Thoren, 1979). Also, spinal cord excitability varies directly with the cardiac pulse, as does physiological tremor of normal skeletal muscles (Forster & Stone, 1976).

Beyond the key role of cardiac afferent signals in physiological regulation, our earlier discussion also illuminates the heart's significant influence on perceptual and cognitive function via its input to higher brain centers. Our discussion has thus far covered behavioral data showing a relationship between the heart's input and cognitive performance, as well as electrophysiological studies demonstrating the synchronization of brain activity to the heart. Beyond these findings, there is also a considerable body of other electrophysiological evidence demonstrating the modulation of higher brain activity by cardiovascular afferent input (see Lacey & Lacey, 1970; McCraty, 2003; and Sandman et al., 1982, for reviews).

Experiments carried out in Germany by psychophysiologist Rainer Schandry have demonstrated that afferent input from the heart evokes cortical responses analogous to "classical" sensory event-related potentials. These experiments have shown that afferent input from the cardiovascular system is accompanied by specific changes in the brain's electrical activity. Schandry and colleagues found, as have we, that this activity is most pronounced at the frontocortical areas, a region particularly involved in the processing of visceral afferent information. In addition, psychological factors such as attention to cardiac sensations, perceptual sensitivity, and motivation have been found to modulate cortical heartbeat evoked potentials in a fashion analogous to the cortical processing of external stimuli (Lader & Mathews, 1970; Montoya, Schandry, & Muller, 1993; Schandry & Montoya, 1996; Schandry, Sparrer, & Weitkunat, 1986). In our own study, in which we investigated the electrophysiology of information processing in relation to intuition, we also found that the heart's afferent input significantly modulates frontocortical activity, especially during the psychophysiological coherence mode (McCraty et al., 2004a, 2004b).

The observation that the heart's afferent input modulates frontal activity is concordant with other findings that activity in the prefrontal cortex covaries with changes in the heart rhythm (Lane et al., 2001). This is consistent with the biological principle of reciprocal connections in neural systems. Therefore, in addition to the well-established routes (e.g., the thalamic pathway) by which cardiovascular afferent signals modulate higher cortical function, there may well be additional routes from the heart to the prefrontal cortex.

Biochemical Interactions

In addition to its extensive neurological interactions with the brain and body, the heart also communicates with the brain and body biochemically, by way of the hormones it produces. Although not typically thought of as an endocrine gland, the heart in fact manufactures and secretes a number of hormones and neurotransmitters that have a wide-ranging impact on body as a whole.

The heart was reclassified as part of the hormonal system in 1983, when a new hormone produced and secreted by the atria of the heart was discovered. This hormone has been variously termed atrial natriuretic factor (ANF), atrial natriuretic peptide (ANP), or atrial peptide. Nicknamed the “balance hormone,” and playing an important role in fluid and electrolyte homeostasis, it exerts its effects on the blood vessels, kidneys, adrenal glands, and many of the regulatory regions of the brain (Cantin & Genest, 1985, 1986). In addition, studies indicate that atrial peptide inhibits the release of stress hormones (Strohle, Kellner, Holsboer, & Wiedemann, 1998), reduces sympathetic outflow (Butler, Senn, & Floras, 1994), plays a part in hormonal pathways that stimulate the function and growth of reproductive organs (Kentsch, Lawrenz, Ball, Gerzer, & Muller-Esch, 1992), and may even interact with the immune system (Vollmar, Lang, Hanze, & Schulz, 1990). Even more intriguing, experiments suggest that atrial peptide can influence motivation and behavior (Telegdy, 1994).

Several years following the discovery of atrial peptide, a related peptide hormone with similar biological functions was identified. This was called brain natriuretic peptide (BNP) because it was first identified in porcine brain. It soon became clear, however, that the main source of this peptide was the cardiac ventricle rather than the brain, and brain natriuretic peptide is now sometimes called B-type natriuretic peptide (Mukoyama et al., 1991).

Armour and colleagues also found that the heart contains a cell type known as intrinsic cardiac adrenergic cells. These cells are so classified because they synthesize and release catecholamines (norepinephrine, epinephrine, and dopamine), neurotransmitters once thought to be produced only by neurons in the brain and ganglia outside the heart (Huang et al., 1996). More recently still, it was discovered that the heart also manufactures and secretes oxytocin, commonly referred to as the “love” or social “bonding hormone.” Beyond its well-known functions in childbirth and lactation, recent evidence indicates that this hormone is also involved in cognition, tolerance, trust, complex sexual and maternal behaviors, as well as in the learning of social cues and the establishment of enduring pair bonds. Remarkably, concentrations of oxytocin produced in the heart are in the same range as those produced in the brain (Gutkowska et al., 2000).

In a preliminary study (10 participants), we examined changes in the blood concentrations of oxytocin and atrial peptide before and after 10 minutes of maintaining the psychophysiological coherence mode, which was generated by a loving emotional focus. While an increase in oxytocin was observed for the whole sample, it was not statistically significant, although it likely would have been with a larger sample. On the other hand, despite the small number of cases, the decrease in atrial peptide was significant. As atrial peptide release is an index of the stretch and contractile force of the atrial wall of the heart, these data suggest that cardiovascular efficiency increases during the psychophysiological coherence mode. The results for the male and female subgroups in this study are shown in Figure 6.

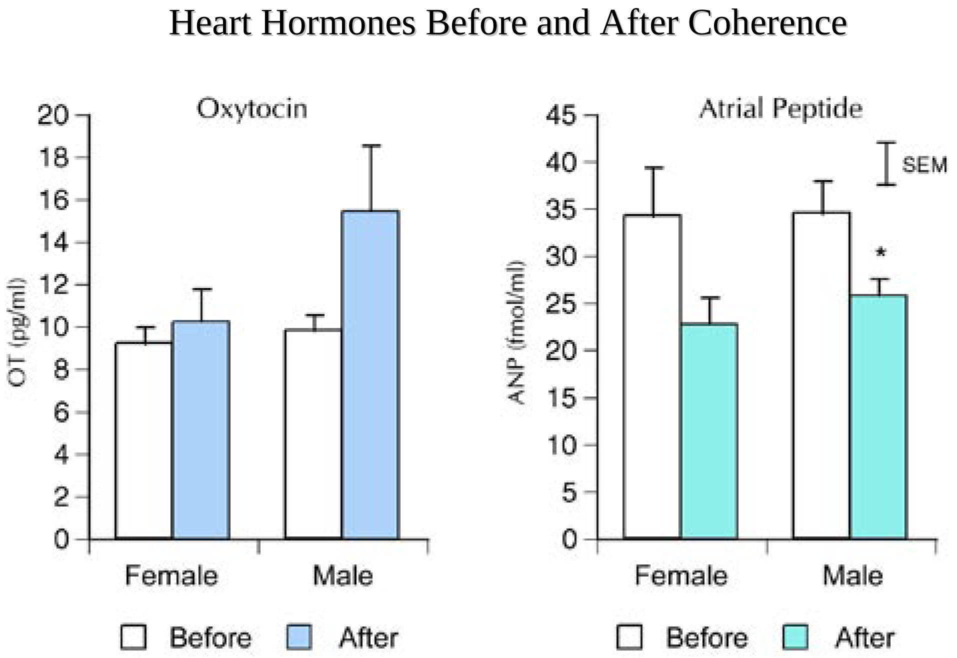


Figure 6. Oxytocin and atrial peptide changes during heart rhythm coherence. Graphs show changes in blood levels of oxytocin and atrial peptide for male and female subgroups from a resting baseline mode to after maintaining the coherence mode for 10 minutes.

In addition to changes in the *amount* of a heart hormone released into the blood affecting cellular and psychological systems, there is also evidence that the temporal *pattern* of the hormonal release has substantial effects independent of the amount of the hormone released. It has been known for some time that neurotransmitters, hormones, and intracellular “second messengers” are released in a pulsatile fashion. Pulsatile patterns of secretion are observed for nearly all of the major hormones, including ACTH, GH, LH, FSH, TSH, prolactin, beta-endorphin, melatonin, vasopressin, progesterone, testosterone, insulin, glucagon, renin, aldosterone, and cortisol, among many others.

Recent studies by German endocrinology researchers Georg Brabant, Klaus Prank, and Christoph Schofl have shown that, in much the same way that the nervous system encodes information in the time interval between action potentials, biologically relevant information is also encoded in the *temporal pattern* of hormonal release, across time scales ranging from seconds to hours (Schofl, Prank, & Brabant, 1995). As most heart hormones are released in synchronicity with the contractions of the heart, there is a rhythmic pattern of hormonal release that tracks the heart rhythm.

This is particularly relevant to our discussion of coherence, as it suggests that changes in heart rhythm patterns—such as those generated during psychophysiological coherence—impact the brain and body in yet another way: that is, they change the pattern of hormonal pulses released by the heart. Although the influence of these changes in hormonal pulse patterns on biological, emotional, and behavioral processes is still unknown, it is likely that the transmission of such hormonal information constitutes another pathway by which the effects of psychophysiological coherence on health, well-being, and performance are mediated.

Biophysical Interactions

With every beat, the heart generates a powerful pressure wave that travels rapidly throughout the arteries, much faster than the actual flow of blood. These waves of pressure create what we feel as our pulse. The heart sounds, generated by the closing of the heart valves and cardiac murmurs, can be heard all over the chest and can extend as far as the groin. Similarly, the pressure waves traveling through the arteries and tissues can affect every organ in the body, especially when the mechanisms that control blood pressure are compromised. In fact, the physical shock wave generated by the heartbeat expands the chest wall to such an extent that the heartbeat can be detected by measuring the chest expansion (this is called the ballistocardiogram).

Important rhythms also exist in the oscillations of blood pressure waves. In healthy individuals, a complex resonance occurs between blood pressure waves, respiration, and rhythms in the ANS. Because pressure wave patterns vary with the rhythmic activity of the heart, they represent yet another language through which the heart can communicate with the rest of the body. In essence, all of our cells sense the pressure waves generated by the heart and are dependent upon them in more than one way. At the most basic level, pressure waves force the blood cells through the capillaries to provide oxygen and nutrients to the cells. In addition, these waves expand the arteries, causing them to generate a relatively large electrical voltage. The waves also apply pressure to the cells in a rhythmic fashion, causing some of the proteins contained therein to generate an electrical current in response to the “squeeze.”

Experiments conducted in our laboratory have shown that a change in the brain’s electrical activity can be seen when the blood pressure wave reaches the brain, around 240 milliseconds after the contraction of the heart. An example is shown in Figure 7.

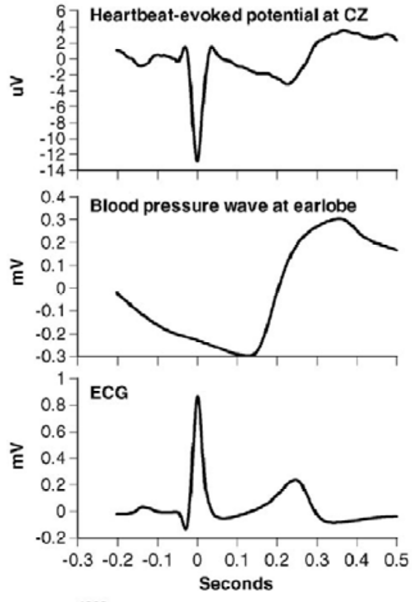

Figure 7. Evoked potentials in the EEG due to effects of the blood pressure wave. The top trace is the EEG recorded at the Cz location, and the middle trace is the blood pressure wave,

detected at the earlobe. Note that the blood pressure wave arrives at the brain around 240 milliseconds after the heartbeat, and a positive shift in the evoked potential in the EEG can be clearly seen upon its arrival.

We hypothesize that, in a similar manner to the encoding of information in the space between nerve impulses and in the intervals between bursts of hormonal activity, information is also contained in the interbeat intervals of the pressure waves produced by the heart. Given that these pressure waves can modulate brain activity and affect vital processes even down to the activity of biomolecules at the cellular level, this represents yet another, potentially important pathway by which information contained in changing heart rhythm patterns orchestrates system-wide effects.

Energetic Interactions

Thus far we have discussed the role of the heart in information processing and communication in terms of neurological, hormonal, and biophysical interactions. In this section we explore how the heart also communicates information to the brain and throughout the body via electromagnetic field interactions.

To understand how communication occurs via these biological fields requires an *energetic* concept of information—one in which data about *patterns* of organization are actually enfolded into the waves of energy generated by the body's activity and distributed throughout the body's electromagnetic field. This concept is quite different from the "lock and key" concept of biochemical interactions, in which communication occurs through the action of biochemicals, such as neurotransmitters, fitting into specialized receptor sites, much like keys open certain locks (McCraty et al., 1998). To explain how energetic communication occurs in biological systems, we take Pribram's holographic approach. He believes, as we do, that the communication of energetic information in biological systems is best understood in the terms of the information processing principles of holographic theory (McCraty et al., 1998; Pribram, 1991; Pribram & Bradley, 1998).

Of all the organs, the heart generates by far the most powerful and most extensive rhythmic electromagnetic field produced in the body. When electrodes placed on the surface of the body are used to measure the ECG, it is the electrical component of the heart's field that is detected and measured. This electrical voltage, about 60 times greater in amplitude than the electrical activity produced by the brain, permeates every cell in the body. Thus, the ECG can be detected by placing electrodes anywhere on the body, from the little toe to the top of the head. The magnetic component of the heart's field, which is approximately 5,000 times stronger than the magnetic field produced by the brain (Russek & Schwartz, 1996), is not impeded by the body's tissues and easily radiates outside of the body. This field can be measured several feet away from the body with sensitive magnetometers (McCraty et al., 1998). These energetic emanations and interactions provide a plausible mechanism for how we can "feel" or sense another person's presence and even their emotional state, independent of body language and other signals (McCraty, 2004).

The heart's ever-present rhythmic field has a powerful influence on communicative processes throughout the body. As already noted above, brain rhythms naturally synchronize to the heart's rhythmic activity, and the rhythms of diverse physiological oscillatory systems can entrain to the heart's rhythm. There is evidence that the heart's field may even play a regulatory role at the cellular level, in that we have found that changes in the cardiac field can affect the growth rate of cells in culture (McCraty et al., 1998).

As can be seen in Figure 20, (Appendix D) the electromagnetic waves generated by the heart are immediately registered in one's brain waves and can have quite a large effect on the heartbeat evoked potential. This same effect has been observed by Gary Schwartz and colleagues at the University of Arizona, who also suggest that energetic interactions between the heart and brain play an important role in psychophysiological processes (Russek & Schwartz, 1994, 1996; Song, Schwartz, & Russek, 1998).

Energetic Signatures of Psychophysiological Modes

Our research has shown that information about a person's emotional state is also communicated throughout the body and into the external environment via the heart's electromagnetic field (McCraty et al., 1998). As described earlier, the rhythmic beating patterns of the heart change significantly as we experience different emotions. Thus, negative emotions, such as anger or frustration, are associated with an erratic, *incoherent* pattern in the heart's rhythms, whereas positive emotions, such as love or appreciation, are associated with a sine-wave-like pattern, denoting *coherence* in the heart's rhythmic activity. In turn, these changes in the heart's beating patterns create corresponding changes in the frequency spectra of the electromagnetic field radiated by the heart.

This is observed when spectral analysis techniques are applied to the energy waveforms generated by the heart (ECG or MCG) in the same way that is typically done when analyzing waves generated by electrical activity in the brain. Different spectral patterns are correlated both with the patterns of beat-to-beat variability and with the current psychophysiological state. These spectral patterns can be interpreted as "information patterns" containing data about the psychophysiological state of the individual in that moment in time. Appendix E shows waterfall plots from the ECG data used to produce the examples of the six different psychophysiological modes described at the outset of this article. These reveal distinctive spectral patterns associated with each specific mode.

The Holographic Heart

The spectra of ECG recordings in Appendix E illustrate the enormous richness and complexity of the heart's activity and the voluminous density of information encoding and transmission that occurs, via the movement of energy, in the body's internal electromagnetic environment. As already noted, similar patterns of information are encoded in the space (time) between nerve impulses and in the intervals between bursts of hormonal activity and pressure waves. We propose, further, that information is encoded and communicated in same manner *in the intervals between heartbeats.* Such an information encoding strategy would allow communication via the neural and hormonal pulses that are produced with each heartbeat and also via the electromagnetic waves produced by the heart. As a means by which the heart can transmit information both throughout the body's psychophysiological networks and into the external environment, the validity of this energetic communication mechanism can be empirically verified. This concept of energetic communication provides the basis for explaining how information about the organization and state of the system as a whole is distributed throughout the body in an almost instantaneous way.

The heart's rhythmic energetic activity lies at the center of our account. The heart generates a continuous series of electromagnetic pulses in which the time interval between pulses varies in a dynamic and complex manner. These pulsing waves of electromagnetic energy give rise to fields within fields, which form interference patterns when they interact with magnetically polarizable tissues and structures. In more specific terms, we postulate that as pulsing waves of energy radiate out from the heart, the energy waves interact with organs and other structures to create interference patterns. At the same time, the endogenous processes in each of the other organs, structures, and systems, including those at the micro-scale of cells and membranes, also generate patterns of dynamic activity. These patterns of dynamic activity radiate out into the body's internal environment as energy oscillations, and they interact with the energy waves from the heart and to some degree with the energy waves of other organs and structures. In each of these interactions the energy waves encode the features of the objects and their dynamic activity as interference patterns. Because the heart generates by far the strongest energy field, which interacts with both the macro and micro scales of the body's organization, the waves it produces operate effectively as global carrier waves that encode the information contained in the interference patterns. These global carrier waves thus contain encoded information from *all* of the body's energetic interactions, and they distribute this information throughout all systems in the body. In this holographic-like process, the encoded information acts to *in-form* the activity of all bodily functions (McCraty et al., 1998). This energetic communication system thereby operates as a global organizing mechanism to coordinate and synchronize psychophysiological processes in the body as a whole.

This theory—that the heart encodes and distributes energetic information holographically—is based on the same model that neuropsychologist Karl Pribram has used to describe the neural processes in the brain that gives rise to perception and memory (Pribram, 1971, 1991). In this model, as Pribram makes clear, the neural impulses are only relaying information from one part of the brain to another. However, the actual processing of information occurs in the spectral domain of energy frequency—a domain outside space and time in which the waves of energy produced by the operation of the neural microstructure interact. Moreover, he has shown that that the same mathematics that Gabor (1948) used to describe the quantum-holographic principles involved in the physics of signal processing can also be used to describe the information processing that occurs in the electromagnetic interactions between the dendritic and axon fields of neurons (McCraty et al., 1998). While a discussion of this is beyond the scope of this article, Pribram and other brain scientists have presented a large body of compelling experimental evidence that supports the veracity of Pribram's bioenergetic model of information processing (King, Xie, Zheng, & Pribram, 1994; McCraty et al., 1998; Pribram, 1971, 1991; Santa Maria et al., 1995). Thus, in addition to the energetic information processing that occurs in the brain, as described by Pribram, we propose that there is also a heart-based global energetic system that encodes and distributes information to coordinate and organize the function of the body as a whole.[15] Thus, in addition to the energetic information processing that occurs in the brain, as described by Pribram, we propose that there is also a heart-based global energetic system that encodes and distributes information to coordinate and organize the function of the body as a whole.

There is compelling evidence to suggest that the heart's energy field is coupled to a field of information that is not bound by the limits of time and space. This evidence comes from a rigorous experimental study we conducted to investigate the proposition that the body receives and processes information about a future event before the event actually happens (McCraty et al., 2004a, 2004b). The study's results provide surprising, even astounding data showing that both the heart and brain appear to receive and respond to information about a future event. Even more tantalizing is the evidence that the heart appears to receive intuitive information *before* the brain. This suggests that the heart is directly coupled to a subtle energetic field of ambient information that surrounds the body, which, in turn, is entangled and interacts with the multiplicity of energy fields in which the body is embedded—including that of the quantum vacuum.

In short, it would appear that we are only just beginning to understand the fundamental role of a bioenergetic communication system in processing information from sources both within and outside the body to *in-form* physiological function, cognitive processes, emotions, and behavior. In this system, it thus seems clear that the energy field of the heart plays a crucial role.

Conclusion

> *The origin of feelings is the body in a certain number of its parts. But now we can go deeper and discover a finer origin underneath that level of description. . .*
> (Damasio, 2003, p. 132)

Damasio sums up the current understanding held by many of today's scientists of the genesis of feelings and emotions. This is the notion that the origin of the particular emotional feelings we experience in each moment lies in the substrata of our body's physiological processes. Positive feelings emerge from body states in which the physiological regulation of the processes of life is easy and free-flowing, while negative feelings reflect the strain of life processes that are difficult for the body to balance and that may even be out of control. This general understanding has roots in an earlier era in psychology and has recently reemerged in the scientific study of emotion. However, the geography of this realm is largely uncharted and has only just begun to be mapped. Needless to say, a more complete understanding awaits development. In this article we have thus endeavored to "go deeper" by offering an account of the "finer origin" of the psychophysiological processes involved in emotional experience.

In "going deeper," we based our approach on the premise that the body's physiological, cognitive, and emotional systems are intimately intertwined through ongoing processes involving reciprocal communication. We hold that an understanding of the workings of these systems must view their activity as emergent from the dynamic, communicative network of interacting functions that comprise the human organism. To describe these communicative processes we adopted an information processing perspective. From this viewpoint, communication within and among the body's systems is seen to occur through the generation and transmission of *rhythms and patterns* of psychophysiological activity. This focus stands in contrast to the traditional approach, in which the amount of physiological activity is viewed as the primary basis of communication. We believe a focus on rhythms and patterns of psychophysiological activity illuminates a more fundamental order of information communication—one that signifies different emotional states, operates to integrate and coordinate the body's functioning as a whole, and also links the body to the processes of the external world.

---

[15] See also the Appalachian Conferences volumes.

In order to understand the functional significance of the morphology of patterns of physiological activity, we drew on the concept of coherence from the physics of signal processing. This is the notion that the degree of efficiency and effectiveness of a system's functioning is directly related to the degree to which there is a harmonious organization of the interaction among the elements of the system. Thus, a harmonious order in the rhythm or pattern of activity signifies a coherent system, whose efficient or optimal function is directly related, in Damasio's terms, to the "fluidity" of life processes. By contrast, an erratic, nonharmonious pattern of activity marks an incoherent system, whose function reflects the "strain" of life processes.

In operationalizing this approach, we used the pattern of the heart's rhythmic activity as our primary physiological marker, as it was the most sensitive measure of changes in emotional states. In reviewing the results of our empirical research, we identified six psychophysiological modes distinguished by their physiological, mental, and emotional correlates. These are: Mental Focus, Psychophysiological Incoherence, Psychophysiological Coherence, Relaxation, Extreme Negative Emotion, and Emotional Quiescence. We showed that different emotions are associated with different degrees of coherence in the activity of the body's systems. While positive emotions such as appreciation, care, and love drive the system toward increased physiological coherence, negative emotions drive the system towards incoherence.

In particular, we highlighted the importance of the psychophysiological coherence mode. Associated with the experience of sustained positive emotions, the coherence mode has numerous psychological and health-related benefits, which have been demonstrated by a growing body of research. Of note are the findings showing a direct relationship between this mode and cognitive performance, as well as data linking this mode to intuition.

Using our empirical findings as a point of departure, we constructed a typology—a conceptual "map"—of the reality of psychophysiological interaction. We differentiated twelve primary types of psychophysiological interaction, distinguished by their values on two theoretical dimensions. Each type describes a distinctive physiological substratum that underlies a different primary emotion or psychophysiological state. Six of the types signify emotional states typically experienced in the course of everyday life. Qualitatively distinct from the feelings of everyday life are six additional types of psychophysiological interaction. Discontinuous from the psychophysiological states of day-to-day life, these are hyper-states of extreme emotions reflecting the body's response to extraordinary circumstances. One interesting implication of the typology is the prediction of four additional hyper-states of psychophysiological interaction, beyond the two hyper-states that we have been able to document empirically.

While our findings on the psychophysiological modes showed that the patterns of the heart's rhythmic activity are clearly *reflective* of different emotional states, in the second part of this article we also presented an account of the heart's constructive role in the physiological processes by which emotional experience is *generated*. According to a model based on Pribram's theory, emotions result from the "mismatch" between familiar input patterns and current input patterns that are different or novel. The heart is the primary source of dynamic rhythmic patterns in the body and possesses extensive communication networks with the brain and other systems. With each beat, it not only pumps blood, but also transmits patterns of neurological, hormonal, pressure, and electromagnetic information through these networks. These multiple inputs to the brain from the heart contribute significantly to the familiar reference pattern and also to those deviations from the familiar that are experienced as changes in emotions.

We also presented evidence showing that the heart has a significant influence on the brain's neurological activity and even plays a role in modulating cognitive functions. While extensive evidence had previously established that sensory-motor integration and cognitive processing is modified by changes in heart rate (beat-to-beat cardiac accelerations and decelerations), our research has expanded this understanding. We found that macro-scale patterns of the heart's rhythmic activity also significantly affect cognitive performance and intentional behavior well beyond the micro-scale effects previously reported. We also demonstrated a significant relationship between heart rhythm patterns and cognitive performance, in that increased heart rhythm coherence leads to improved cognitive performance.

This along with other findings led us to propose that a global level of organization serves to bind and synchronize the body as a whole. In this function we believe that the heart is a key organ in orchestrating activity across multiple systems, encompassing both micro and macro levels of organization. We proposed that information is encoded in the interbeat intervals of the waveforms of neurological, hormonal, pressure, and electromagnetic activity generated by the heart. Because of the heart's wide-ranging linkage to the body's major systems, information encoded in the heart's rhythmic patterns both reflects and influences the ongoing dynamics of the body as a whole. Furthermore, when the heart's rhythmic activity shifts into coherence, synchronization and harmonious interaction within and among systems is the result. This, in turn, produces optimal states of health, physical activity, and cognitive performance. Thus, the heart is a critical nodal point in the psychophysiological network: it acts as the conductor in the human symphony, setting the beat that binds and synchronizes the entire system.

An important, though little investigated, way in which the heart acts as a global conductor is through its electromagnetic interactions. We proposed that the electromagnetic fields produced by the heart form a complex energetic network that connects the electromagnetic fields of the rest of the body. In doing so, the heart's energetic field acts as a modulated carrier wave that encodes and communicates information throughout the entire body, from the systemic to the cellular levels, and even conveys information outside the body between individuals. In these ways it provides a global signal that integrates the order of the system as a whole.

The concept of an energetic information field is not a new one. Indeed, many prominent scientists have proposed models in which information from all physical, biological and psychosocial interactions is enfolded as a spectral order outside the space/time world in the energy waveforms of the quantum vacuum. Holographic principles (Gabor, 1948) form the basis of most of these theories and have been used to describe how information about the organization of a whole is nonlocalized—enfolded and distributed to all parts and locations via the energy waveforms produced by interactions in the brain, (Pribram, 1971, 1991) social structures, (Bradley, 1987; Bradley & Pribram, 1998) and the universe (Bekenstein, 2003; Nadeau & Kafatos, 1999). We adopted a holographic perspective to describe how energy waveforms generated by the heart's electromagnetic field encode and distribute information about all structures and processes throughout the body from the cellular level to the body as a whole. Moreover, the energy fields produced by the heart and other bodily structures are transmitted externally. And because these energy fields are in continuous interaction with the multiplicity of energy fields in the environment, it appears that information about nonlocal events and processes is conveyed back to the body and processed as intuition.

We believe that the concept of energetic information holds promise as a way of understanding how the body's bioenergetic communication system operates to process information from sources both within and outside the body. Based on the evidence we have presented, it seems clear that the energy field of the heart plays a crucial role in in-forming physiological function, cognitive processes, emotions, and behavior.

We have endeavored to present a deeper understanding of the central significance of the heart in virtually all aspects of the body's function. As a principal and consistent source of rhythmic information patterns that impact the physiological, cognitive, and emotional systems, the heart thus provides an access point from which a change in system-wide function can be immediately effected. When positive emotions are used to shift the heart's pattern of activity into coherence, a global transformation in psychophysiological function occurs. As the evidence we have presented clearly shows, this transformation results in increased physiological efficiency, greater emotional stability, and enhanced cognitive function and performance. As a simple and direct means by which one can shift into a state of psychophysiological coherence, the HeartMath tools are a highly effective method to facilitate this transformation. In the case of Chris, with which we opened this article, the use of these tools proved to be a life-saving and life-changing intervention, leading to changes not only in his physical health, but also in his emotional life, work performance, and relationships. We believe that the growing use of these and similar heart-based tools around the globe by educators and students, health care workers and patients, and managers and employees, among others, can play a significant part in improving the "life processes" of humankind.

Rollin McCraty, Ph.D. *of Boulder Creek, California, is the GCMS project coordinator. McCraty, who has been with the Institute of HeartMath since its creation in 1991, is IHM's executive vice president and director of research. A psychophysiologist, Dr. McCraty's research interests include the physiology of emotion, with a focus on the mechanisms by which emotions influence cognitive processes, behavior, and health. A fellow of the American Institute of Stress, McCraty is a member of the International Neurocardiology Network, American Autonomic Society, Pavlovian Society and Association for Applied Psychophysiology and Biofeedback. He and his team regularly participate in studies with scientific, medical and educational institutions worldwide, including Stanford University, Arizona State University, Wake Forest University, Clemson University and the Miami Heart Research Institute. His research has appeared in many journals, including the American Journal of Cardiology, Journal of the American College of Cardiology, Stress Medicine and Biological Psychology.* www.heartmath.org
Email: rollin@heartmath.org

Mike Atkinson *of Boulder Creek, California, the Institute of HeartMath's Research Center laboratory manager, is responsible for key development and implementation aspects of the Global Coherence Monitoring System. He has extensive experience gathering, processing and performing statistical analysis of a wide range of psychophysiological data. Atkinson is co-holder of three patents related to physiological coherence monitoring used in organizational, educational and health-care settings. Short-term and 24-hour HRV assessments he designed are used internationally by physicians, researchers and health organizations. Atkinson, co-author of several psychological surveys used to assess stress, emotions and organizational effectiveness, has played a key role in many laboratory and field research studies examining the effects of stress and emotions on bodily systems, including heart-brain interactions and cognitive performance. He has co-written many scientific papers published in numerous professional journals.* www.heartmath.org

Dana Tomasino *has a research background in molecular biology and psychophysiology, and a passion for using an energy-based approach to elucidate fundamental patterns and processes that connect and unify the cellular/molecular, physiological, emotional, social, and spiritual dimensions of experience. With her colleagues at the Institute of HeartMath, she has studied heart–brain interactions and the mechanisms by which positive emotions influence cognitive processes, intuition, behavior, and health.*

Raymond Trevor Bradley, Ph.D. *originally from New Zealand and now Capitola, California, has been pioneering the multidisciplinary application of physics, information science, neuropsychology, psychophysiology, and sociology in research to understand fundamental processes in social collectives. Dr. Bradley has conducted a vast array of research, including studies on the psychophysiological basis of intuitive foreknowledge and nonlocal communication, his current area of interest. He has published four research monographs and the book, Charisma and Social Structure: A Study of Love and Power, Wholeness and Transformation. His research has led him to write more than 40 articles in sociology,* *psychology, neuroscience, psychophysiology and management science. Bradley directs the Institute for Whole Social Science, is senior research scientist at the Institute of HeartMath and a longtime member of the HeartMath Scientific Advisory Board.* www.heartmath.org/research/publications.html

Appendixes

Appendix A: Modes of Psychophysiological Function

In the course of our research on the relationship between HRV and emotion, we observed that certain psychophysiological states were consistently associated with distinct psychological and behavioral correlates as well as with specific patterns of physiological activity throughout the body. As these systemic patterns were found to hold over many trials across diverse study populations, we concluded that they constituted six general categories of psychophysiological function, which we call *modes*, each of which is distinguished by a unique set of characteristics. Although there is individual variation within each mode, there are broader empirical commonalities that are characteristic of each mode and that differentiate the six modes from one another.

Four of these psychophysiological modes are readily generated in the context of everyday life. We have termed these modes *Mental Focus* (associated with impassive emotions experienced while attention is directed to performing familiar, cognitively engaging tasks or actions), *Psychophysiological Incoherence* (associated with negative emotions such as anger, anxiety, etc.), *Relaxation* (associated with calm emotions experienced while resting from the effort and stress of everyday life), and *Psychophysiological Coherence* (associated with positive emotions such as appreciation, care, compassion, etc.). We have also identified two additional modes, *Emotional Quiescence* and *Extreme Negative Emotion*, which both appear to belong to a qualitatively different category of psychophysiological function. These two modes are physiologically and experientially distinct from the other four modes and are generated under more extraordinary life circumstances. Before moving on to describe the emotional tone and empirical characteristics of each of these modes, it is necessary to provide some information on the heart rhythm data presented in the graphs in this section.

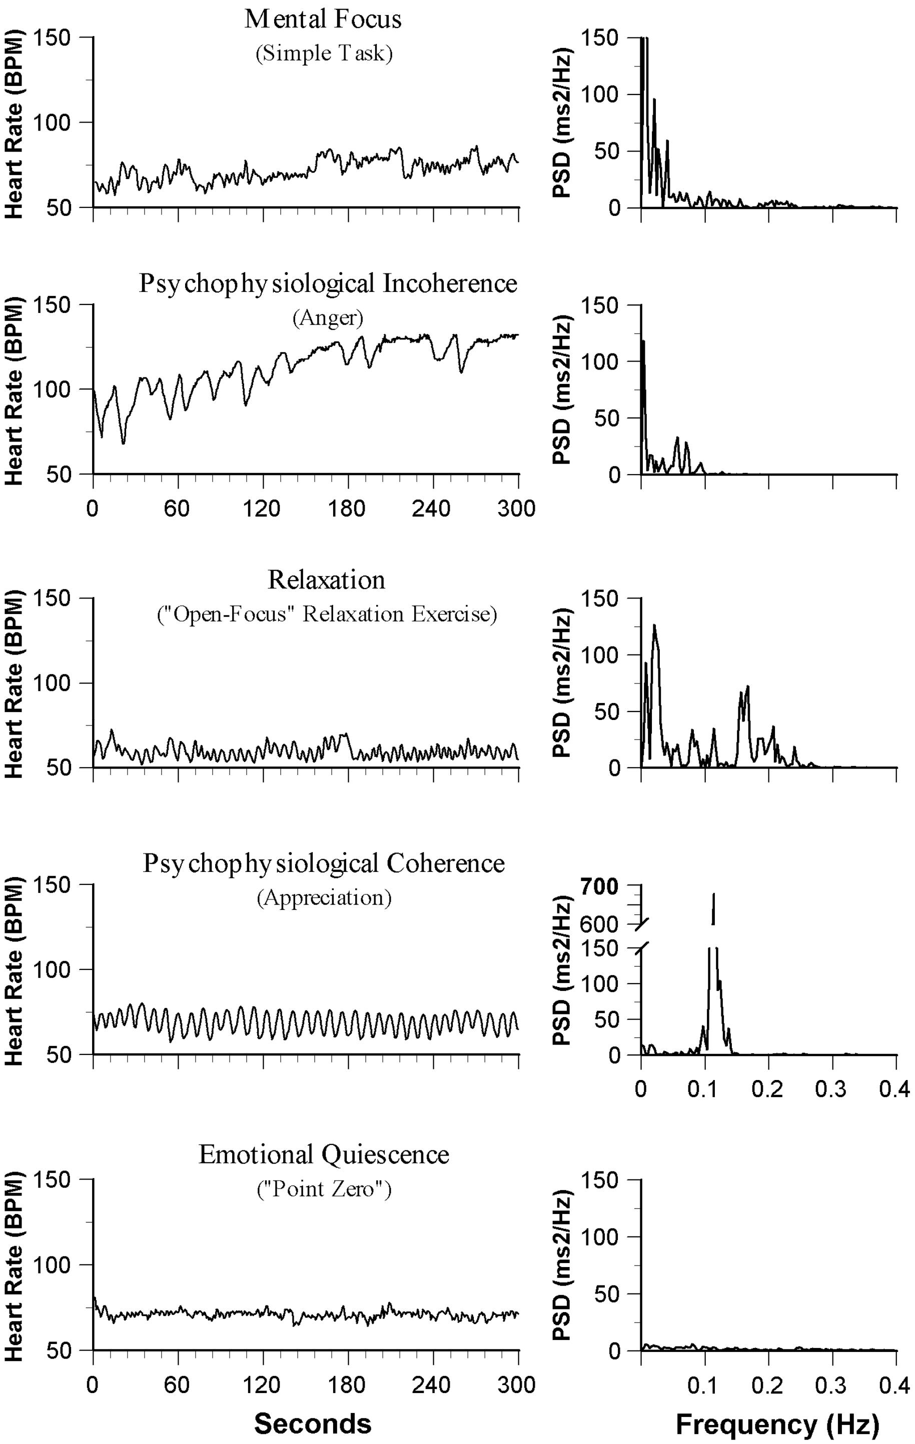

Figure 8. Heart rhythm patterns during different psychophysiological modes.
The left-hand graphs are heart rate tachograms, which show beat-to-beat changes in heart rate. To the right are the heart rate variability power spectral density (PSD) plots of the tachograms at left. While there are individual variations in the HRV patterns associated with each mode, the examples depicted are typical of the characteristic aspects of the more general patterns observed for each mode. *Mental Focus* is characterized by reduced HRV. Activity in all three frequency

bands of the HRV power spectrum is present. Anger, an example of the *Psychophysiological Incoherence* mode, is characterized by a lower frequency, more disordered heart rhythm pattern and increasing mean heart rate. As can be seen in the corresponding power spectrum to the right, the rhythm during anger is primarily in the very low frequency region, which is associated with sympathetic nervous system activity. In this example, the anger was intense enough to drive the system into an extreme state, where the heart rhythm trace became flat (indicating very low HRV) around 200 seconds. *Relaxation* results in a higher frequency, lower amplitude rhythm, indicating reduced autonomic outflow. In this case, increased power in the high frequency region of the power spectrum is observed, reflecting increased parasympathetic activity (the relaxation response). *Psychophysiological Coherence*, which is associated with sustained positive emotions (in this example, appreciation), results in a highly ordered, sine-wave-like heart rhythm pattern. As can be seen in the corresponding power spectrum, this psychophysiological mode is associated with a large, narrow peak in the low frequency region, centered around 0.1 Hz. Note the scale difference in the amplitude of the spectral peak during the coherence mode. This indicates system-wide resonance, increased synchronization between the sympathetic and parasympathetic branches of the nervous system, and entrainment between the heart rhythm pattern, respiration, and blood pressure rhythms. The coherence mode is also associated with increased parasympathetic activity, thus encompassing a key element of the relaxation response, yet it is physiologically distinct from relaxation because the system is oscillating at its resonant frequency and there is increased harmony and synchronization in nervous system and heart–brain dynamics. The *Emotional Quiescence* mode is characterized by state-specific very low HRV. Due to the low HRV, the power spectrum has very little power in any of the three frequency regions.

Figure 8 shows the typical heart rhythm patterns and the associated HRV power spectra for the six psychophysiological modes we have identified. These patterns are reflective of the ongoing adjustments of the various physiological systems in relation to the ever-changing processes in the body and in the external environment. The normal variability in heart rate is due to the synergistic action of the two branches of the ANS, which act to maintain cardiovascular parameters in their optimal ranges and to permit appropriate reactions to changing external or internal conditions. In a healthy individual, the heart rate estimated at any given time represents the net effect of the parasympathetic (vagus) nerves, which slow heart rate, and the sympathetic nerves, which accelerate it. We use the term *adaptive variability* to denote these ongoing moment-by-moment accommodations. Within normal parameters, greater amplitudes of oscillation are associated with health. Thus, the amplitude of rhythmic physiological processes, such as heart rhythms, may index the health status of the individual’s nervous system and capacity to respond to environmental demands (Friedman & Thayer, 1998; Peng et al., 1994; Porges, 1992; Wolf, 1995).

The left-hand graphs are heart rate tachograms, which show the beat-to beat changes in heart rate (heart rhythms) in the different modes. These patterns have been identified in recordings obtained both in the laboratory and in real-life circumstances from a database of more than one thousand cases.

To the right are shown the heart rate variability power spectral density (PSD) plots for each of the heart rhythms. To discriminate and quantify sympathetic and parasympathetic activity and total autonomic nervous system activity, the HRV data must be converted into their spectral components. This is done by applying a mathematical transformation, the Fast-Fourier Transform. The resultant power spectrum reduces the heart rhythm into its constituent frequency components. These are divided into three main frequency ranges, each of which corresponds to a specific physiological activity and rhythm.

The very low frequency (VLF) range (0.0033–0.04 Hz) is primarily an index of sympathetic activity, while power in the high frequency (HF) range (0.15–0.4 Hz), representing more rapid beat-to-beat changes in heart rate, is primarily due to parasympathetic activity. The frequency range encompassing the 0.1 Hz region is called the low frequency (LF) range (0.04–0.15 Hz) and reflects activity in the feedback loops between the heart and brain that control short-term blood pressure changes and other regulatory processes. The physiological factors contributing to activity in the LF range are complex, reflecting a mixture of sympathetic and parasympathetic efferent and afferent activity as well as vascular system resonance.

The six psychophysiological modes we have identified will next be distinguished in terms of their emotional tone and associated heart rhythm and ANS activation patterns. It should be noted that these modes can also be distinguished on the basis of the patterns of their associated energetic (electromagnetic) activity; this is discussed in Appendix E.

Modes of Everyday Psychophysiological Function

Mental Focus

The top graph in Figure 8 depicts a typical heart rhythm pattern and the associated HRV power spectrum during a period of “mental focus.” We use this term to describe an impassive emotional state experienced while performing a familiar, routine task or action. This state is primarily one of mental attention to the task at hand and, as such, is characterized by little or no emotional arousal, either of a positive or negative nature, and low motor activity. In the example shown in Figure 8, the research subject was sitting quietly while focused on a routine computer task. As depicted in the heart rhythm graph (left-hand side), the HRV pattern is relatively constrained in its overall amplitude variation, and there is less higher frequency variability as compared to the pattern for relaxation.

The HRV power spectrum (right-hand side of Figure 8) shows some activity in all three frequency bands, as would be expected from examining the heart rhythm trace. The multiple peaks present in the VLF region indicate that the organization of oscillations in this band is unstable and variable; this is apparent in the heart rhythm data as well. The fact that the overall heart rate remains relatively constant (approximately 70 bpm), indicates, in this example, that there was not an increased activation of the sympathetic nervous system. However, there appears to be less synchronized activity in overall ANS function as compared to the coherence or relaxation modes, which is reflected in the more erratic heart rhythm pattern. The power in the HF band is much lower than that in the Relaxation mode, indicating there is less parasympathetic activity. This typically correlates with shallower, faster breathing rhythms. There is also reduced power in the LF band, which is a common finding in tasks that require primarily mental focus with little motor activity. In sum, these data show that there is reduced autonomic activity and overall HRV during periods of mental focus when compared to the relaxation or coherence modes.

Psychophysiological Incoherence

Psychophysiological Incoherence is associated with negative emotions, such as anger, frustration, and anxiety. While there is some variation within this mode in the morphology of the associated HRV waveforms, Psychophysiological Incoherence is generally typified by an erratic and disordered heart rhythm pattern (see the example of frustration in Figure 1). The example of this mode shown in Figure 8 was recorded when this individual was experiencing an episode of anger during an argument with his wife while sitting still in a car. In this case, the emotion of anger was sufficiently intense to activate the sympathetic nervous system, resulting in a more pronounced VLF rhythm and an increasing mean heart rate. As can be seen in the corresponding power spectrum to the right, there is a single large peak in the VLF region, which indicates sustained sympathetic activation, whereas the HF region shows virtually no activity. The activity in the LF region remains strong because the physiological mechanisms regulating blood pressure are active in order to maintain control and inhibit sympathetic outflow so that the blood pressure does not reach levels that will harm the system.

In addition to the Psychophysiological Incoherence mode, which is the main pattern observed in this recording, parts of this same recording also show another pattern of psychophysiological response that is indicative of a different mode, evident in the segments circled in Figure 8. This pattern illustrates what happens when an individual experiences an extreme negative emotion—in this case, intense anger. Extreme negative emotions such as this can lead to excessive sympathetic activation, in which the heart rate increase approaches the range of maximum function and where the heart rate variability pattern almost flattens out. We believe that this psychophysiological pattern is indicative of a "hyper-state" of extreme negative emotional experience, which is described in more detail below.

Relaxation

The Relaxation mode is a state of emotional calm experienced when resting from the activity and stress of everyday life. It is characterized by a higher frequency, lower amplitude rhythm, and a virtually steady heart rate (approximately 60 bpm in this example) once the system has stabilized in this mode. In the beginning of the shift into relaxation, however, there is also typically a decrease in heart rate, which indicates a reduction in overall autonomic outflow and a shift in autonomic balance towards increased parasympathetic activity. This example (Figure 8) is from a case in a study in which the research subjects were instructed to sit quietly and not to engage in any active cognitive or emotional processing or to use any specific meditative or emotional management techniques. The increased parasympathetic activity can be clearly seen in the relatively large peak in the HF band of the power spectrum. There is also activity in both the VLF and LF bands because the sympathetic and blood pressure control rhythms are still active (as would be expected), although there is shift to increased parasympathetic activity (the relaxation response) and lower overall HRV. This same rhythm and power spectral signature are also seen during periods of restful sleep.

It is imperative that the Relaxation mode not be confused or confounded with the Psychophysiological Coherence mode described next. There is typically an overall reduction in ANS outflow and a shift in ANS balance towards increased parasympathetic activity during periods of rest or relaxation, or with structured relaxation or meditation techniques (resulting in lower HRV). Although the coherence mode is also associated with increased parasympathetic activity, and thus encompasses a key element of the relaxation response, relaxation and meditation are *not* usually associated with significant increases in physiological coherence. Not only are there fundamental differences between the physiological correlates of relaxation and coherence, but the associated psychological states are also markedly different. Many relaxation and mediation techniques (with specific exceptions) are essentially disassociation techniques, whereas the psychological states associated with coherence are directly related to activated positive emotions.[16]

Psychophysiological Coherence

The example of the Psychophysiological Coherence mode shown in Figure 8 was generated when this research participant was instructed to activate and sustain a genuine feeling of "appreciation." The graph shows how sustained, modulated positive emotions, such as appreciation or love, are associated with a highly ordered, smooth, sine-wave-like heart rhythm pattern (coherence). It is important to understand that although the coherence mode is typically associated with increased parasympathetic activity, whether a shift in heart rate (either up or down) occurs depends on the preceding psychophysiological state of the individual. The coherence mode thus does not necessarily involve a change in *heart rate* per se, or a change in the *amount* of heart rate variability. Rather, it is signified by a shift to a distinctive heart rhythm *pattern*.

As can be seen in the corresponding power spectrum, this psychophysiological mode is associated with an unusually high-amplitude peak in the LF band, centered around 0.1 Hz. To appreciate the magnitude of this difference relative to the other five modes, it is important to observe that there is a scale difference in the amplitude of the spectral peak in the LF region in the coherence mode[17] (note the changed ordinate scale for Appreciation relative to the other modes): the top of the peak is near 700 while it is below 150 in all of the other examples. This indicates system-wide resonance, increased synchronization between the sympathetic and parasympathetic branches of the nervous system, and entrainment between the heart rhythm pattern, respiration, and blood pressure rhythms.

---

[16] Meditation and relaxation techniques can be inappropriately thought to induce coherence when they are combined with specific breathing techniques, because certain paced breathing rhythms also induce the physiological coherence mode.

[17] When speaking of coherence in a psychophysiological context, it is important to note the distinction between types of patterns that are associated with organized, healthy function and those that underlie pathology. Within normal parameters, a greater amplitude of oscillation in heart rate variability and most other physiological processes is associated with health. Thus, the amplitude of the oscillations associated with the heart's rhythm is a general index of the status of the individual's nervous system and capacity to respond to change. In other words, the greater the amplitude of "organized" rhythmic physiological variability, the greater the response potential or possible range of behavior. This is relevant to our discussion of coherence because many illnesses are characterized by a reduction in the complexity of the patterns of activity generated by the body's systems (i.e., previously complex rhythms and patterns become strikingly periodic and predictable). For example, a low overall HRV is associated with autonomic neuropathy and autonomic deinnervation (as found in heart transplant recipients) and is

One may observe that the heart rhythm in both the relaxation and coherence modes can manifest a sine-wave-like pattern. In the psychophysiological coherence mode, however, this pattern occurs at a lower frequency and typically with a higher amplitude. Even more significantly, in the coherence mode increased synchronization, resonance, and entrainment across multiple bodily systems occur, all of which reflect a level of global organization that is not present in the relaxation mode.

Although in relaxation increased autocoherence can occur in the breathing rhythm (as in the example shown in Figure 8) and it is also possible to have a type of entrainment between the respiration and heart rhythms, these characteristics are *not* reflective of the system-wide entrainment or resonance that typify psychophysiological coherence. The type of entrainment that is sometimes observed in the relaxation mode occurs in the high frequency range of the HRV power spectrum and is associated with respiratory sinus arrhythmia (RSA), which is discussed in detail in the main text.

We have found that as the respiratory rate is lowered, there is a tipping point (typically below 0.26 Hz) at which the heart rate variability pattern, blood pressure rhythm and respiratory rhythms suddenly entrain. In essence, the system jumps to a different physiological mode and settles into a new oscillatory rhythm at its resonant frequency. In the majority of people, the lower and upper thresholds for the onset of the coherence mode are approximately 0.04 and 0.26 Hz, respectively, in the HRV power spectrum, but the rhythm typically settles at the system's resonant frequency of ~0.1 Hz.

Modes Distinguished by Low Variability

As noted previously, we have empirical evidence of two additional modes that appear to belong to a qualitatively different category of psychophysiological function than the four modes of everyday function just described. What sets these patterns apart is that they are not typically experienced in the course of normal everyday life but, instead, occur under extraordinary or unusual circumstances. Also, they are physiologically and experientially distinct—physiologically, they are both associated with very low heart rate variability; experientially, they are at opposite ends of the spectrum, with one mode being associated with an uncommon sense of inner peace and the other mode associated with extreme negative emotions such as anger and rage.

---

predictive of increased risk of sudden cardiac death and all-cause mortality. Low HRV is also associated with depression, anxiety and many other psychological disorders.

This loss of variability and complexity is quite different from the type of coherence we are describing. The coherent mode described here is not characterized by a loss of variability, but rather by the emergence of a more organized variability. Additionally, it is important to note that these are not steady states, such as those associated with disease; rather, they are highly dynamic and changing.

Emotional Quiescence

In addition to the psychophysiological coherence mode, there is also another, less common mode—“Emotional Quiescence”—that emerges when certain individuals undergo an extra-ordinary transition to enter a distinctive heart-focused psychophysiological state (see Figure 9). The specific HeartMath tool that practitioners use to enter this mode is called the Point Zero technique.

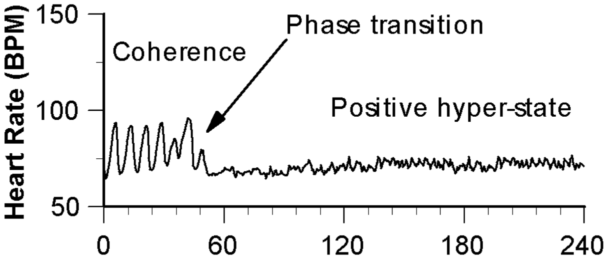

Figure 9. Phase-shift to a positive hyper-state. This figure shows a typical example of the phase transition observed in a subject moving from the Psychophysiological Coherence mode to a positive hyper-state we call Emotional Quiescence. Note the abrupt change from the larger-amplitude sine-wave-like heart rhythm pattern distinguishing the Coherence mode to the much higher-frequency and lower-amplitude rhythm marking the Emotional Quiescence positive hyper-state.

The subjective experience of this mode is a state in which the intrusion of mental and emotional “chatter” is reduced to a point of internal quietness, to be replaced by a profound feeling of peace and serenity and a deep sense of being centered in the heart.[18] First-person descriptions include a heightened awareness of the movement of energy both within one’s body and between oneself and other people; the feeling of being “totally alive” and “fully present” in the moment; the experience of an all-embracing, non-judgmental love (in the largest sense); and a sense of increased connectedness with one’s higher self or spirit, and with “the whole.” It is important to point out that many experienced mediators who have learned the Point Zero technique describe their subjective experience of Emotional Quiescence as a distinctly different state than is typically experienced through meditation approaches.

Physiologically, when an individual enters the Emotional Quiescence mode, either the sympathetic and parasympathetic outflow from the brain to the heart is substantially reduced, or an energetic control acting at the level of the heart itself is activated to such a degree that the beat-to-beat oscillations in the HRV waveform become nearly zero. It is also possible that both occur simultaneously. This leads to an HRV power spectrum with unusually low power in all the frequency bands.[19] As shown in Figure 8, the heart rhythm is almost a flat line and therefore the power spectrum has almost no power in any of the frequency bands due to the lack of heart rate variability.

---

[18] In earlier publications we used the term “internal coherence” to describe the physiological aspects of this mode; however, we now feel that this terminology is confusing, as the term “coherence” is better used in the broader context which embraces entrainment, resonance, and synchronization. We also used the term “amplified peace” in earlier publications to describe the subjective inner state.

Extreme Negative Emotion

At the opposite end of the emotional spectrum lies a second unusual non-everyday psychophysiological mode. Individuals can enter this mode when experiencing extremely activated negative emotions, such as those that occur during episodes of intense fear, anger, or rage. In the Extreme Negative Emotion mode the heart rhythms are also reduced to a flat-line appearance. However, in contrast to Emotional Quiescence, the underlying physiological mechanism is quite different. In this mode the HRV becomes very low due to excessive sympathetic outflow to the heart, which both drives the heart rate up to very high rates and inhibits parasympathetic outflow to the heart. At higher heart rates there is less time for variation in the beat-to-beat heart rate to occur,[20] and this combined with the inhibition of parasympathetic outflow reduces the amplitude of the variations in heart rate to nearly zero. An example of this mode can be seen in the latter part of the heart rhythm trace shown in Figure 10. Although the HRV power spectra for the Extreme Negative Emotion and Emotional Quiescence modes appear very similar, these modes are readily distinguished by the overall heart rate and by the ECG spectrum (discussed later).

---

[19] It is important to note that the individuals we have studied have the ability to enter this mode at will and thus demonstrate exceptional self-regulation because their HRV is normally quite large. This can be a source of confusion, as low HRV is usually associated with pathology. However, the state-specific, short-term low HRV associated with the Emotional Quiescence mode (or that seen in meditation) is markedly different from the low HRV found in pathological conditions. In pathology the HRV is *always* low and is associated with impaired function of the autonomic nervous system, heart, or brain stem centers.

[20] The link between heart rate and HRV is termed cycle length dependence. In healthy individuals as heart rate increases, HRV decreases, and vice versa.

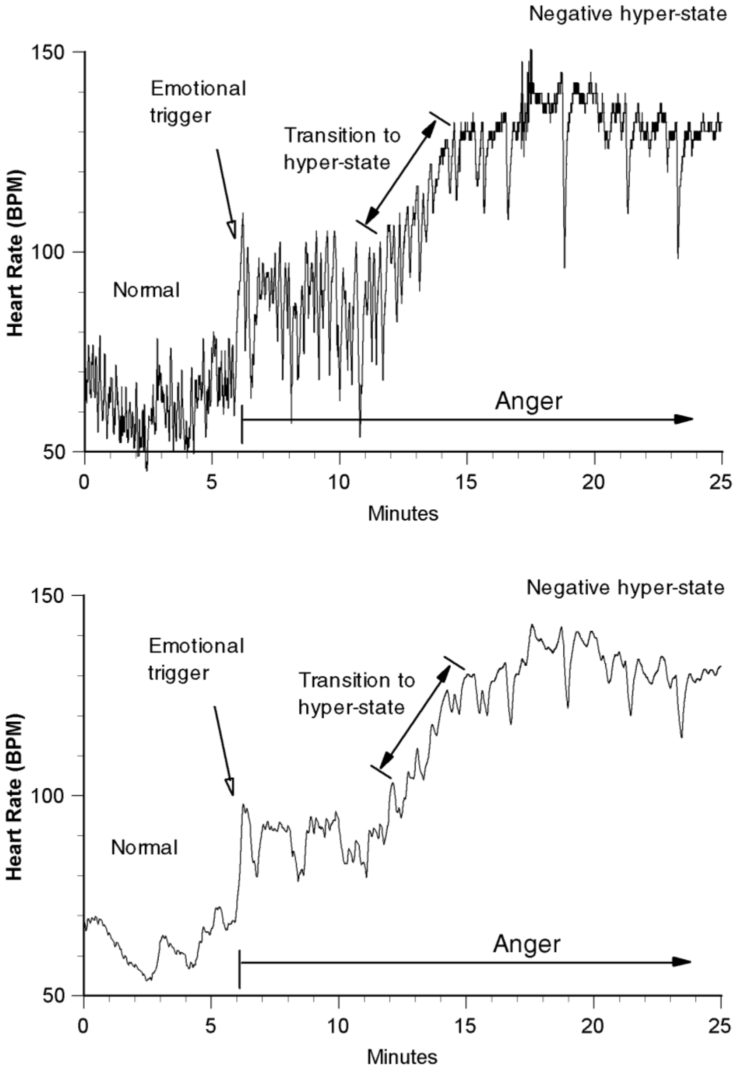

Figure 10. Phase-shift to a negative hyper-state. The heart rhythm data shown in the top graph were recorded from a male who was riding in a car and got into an argument with his wife. Before the argument and resulting emotional activation, the graph shows a period of “normal” psychophysiological activity. Clearly apparent is the point (spike) at which the subject’s emotion of anger was triggered. This was followed by a period (from about 6-12 minutes in the record) of sympathetic activation and increased heart rate. Next, there is evidence of a relatively rapid transition, which culminates in a phase-shift into a negative hyper-state of intense anger. As is evident from this case, the negative hyper-state is characterized by a high heart rate and significantly reduced HRV. The large downward spikes in the hyper-state waveform pattern, which indicate periodic drops in heart rate, result from the subject taking deep breaths. The bottom graph depicts a 10-second moving average of the heart rhythm data displayed in the top graph. This is shown to highlight the general morphology of the changes in heart rate and rhythm and the phase-transition between the states.

It should be noted that a similar pattern of physiological activity (high heart rate and low HRV) can also occur with sustained extreme physical exertion. As just described above, when the heart rate is driven so high that it all but reaches the heart’s physical limit, there is little space for variation so that a greatly reduced HRV results. However, it is rare that an individual's system is driven to this extreme state through physical exertion. The fact that extreme negative emotions alone can drive the physiological systems to this same extreme state underscores the profound impact that such emotions can have on the body.

Extreme anger or rage is subjectively experienced as an intense, highly focused state that is usually directed outward. Individuals describe their subjective experience of this state as one that is highly energized and seething with negative emotion, with a feeling of increased physical power and a corresponding reduction in sensitivity to physical pain.

The empirical documentation of these two hyper-states of psychophysiological function has led us to postulate that there are at least four additional hyper-states that have yet to be discovered and empirically mapped. The basis for this expectation will become clear in the conceptual map we develop of emotional states and their associated distinguishing physiological characteristics.

Appendix B: Previous Research

The Baroreceptor Hypothesis: A Micro-Scale Perspective

Some of the most influential work on the relationship between heart–brain interactions and performance was conducted in the 1960s and 1970s by psychophysiologists John and Beatrice Lacey, who postulated a causal role of the cardiovascular system in sensory-motor performance (Lacey, 1967; Lacey & Lacey, 1970, 1974). From a large body of electrophysiological and behavioral data they developed the "baroreceptor hypothesis," which is also known as the "Lacey hypothesis."

The Laceys' hypothesis postulated that the cardiovascular system exerts a modulating influence on higher centers of the brain, including the cortex, via afferent input from the baroreceptors (mechanosensory neurites) in the heart, aortic arch, and carotid arteries (Lacey, 1967; Ostir et al., 2001). It was proposed that cortical activity is briefly inhibited as a result of this afferent input, and therefore that sensory intake will be enhanced at times when baroreceptor discharge is minimal. As some mechanosensory neurites are activated in a pulsating fashion in phase with the systolic blood pressure wave, the Laceys expected sensory-motor integration and performance to oscillate with this same rhythm. Behaviorally, this should be reflected in reduced perceptual and perceptual-motor performance in the case of an increase in baroreceptor activity and, accordingly, a performance increase in the case of reduced baroreceptor activity. The conclusion from such a finding would be that the cardiovascular system plays an instrumental role in modulating sensory input and perception.

The Laceys' experimental work did in fact confirm a relationship between the heart's activity and cognitive performance. A major focus of their research investigated subjects' performance on reaction time tasks involving sensory intake. They found that a deceleration in heart rate during the anticipatory period preceding such a task was associated with improved cognitive performance (faster reaction time), and conversely, an acceleration in heart rate was associated with reduced cognitive performance (slower reaction time) (Ostir et al., 2001). They also observed in these experiments that the greater the magnitude of the heart rate deceleration, the faster the reaction time (Lacey & Lacey, 1964, 1970, 1974). These observations were consistent with the Laceys' hypothesis: by their reasoning, a heart rate deceleration prior to receiving information from the environment was seen as an adaptive response to enhance sensory processing by increasing the probability that information will arrive at a time when the brain is minimally inhibited as a result of baroreceptor activity. This follows from the rationale that fewer ventricular contractions prior to environmental intake will result in less baroreceptor discharge and thus reduce cardiac-related cortical inhibition.

Although the Laceys' own findings appeared to be consistent with the baroreceptor hypothesis, the results of numerous subsequent experiments by independent researchers investigating this relationship at normal heart rates have been highly inconsistent and contradictory (for reviews, see Sandman et al., 1982; van der Molen et al., 1985). Most of these studies sought to clarify the relationship between cardiovascular activity and perceptual processing by examining performance changes *within* a single cardiac cycle—that is, the period from one heartbeat to the next. Since it could be determined at what time the pulse wave reaches the baroreceptors and how long it takes for the neural impulses to reach the cortex, the precise timing of the expected inhibitory effect could be predicted.

Among the experiments that did show "cardiac cycle effects," different forms of performance change were found, and reductions in sensory or sensory-motor performance were observed at nearly *every part* of the cardiac cycle—a finding unexplainable by the baroreceptor hypothesis. However, while most of these studies presumed that blood pressure was the relevant factor, they relied only on heart rate data and assumed that blood pressure would drop with heart rate decreases and increase when heart rate increased. Unexpectedly, later studies found that heart rate and blood pressure are quite independent of each other under certain circumstances. In fact, it has been shown that in the protocol used (reaction time task with a warning stimulus) in most of the studies designed to test the Lacey hypothesis, blood pressure *increases* as heart rate decreases (Wölk, Velden, Zimmerman, & Krug, 1989). Clearly, then, these data were not consistent with the baroreceptor hypothesis, which predicted that *reduced* afferent activity preceded the processing of a significant external event.

The next major advancement in the understanding of how the activity of the heart modulates performance was provided by psychophysiologists Christoph Wölk and Manfred Velden of the University of Osnabrück in Germany. These researchers revised the Laceys' original hypothesis based on the results of several studies in which they presented a large number of auditory discrimination tasks (participants were asked to detect a tone embedded in noise) in very small steps (33 milliseconds) over the cardiac cycle. These experiments showed that performance actually fluctuated across the entire cardiac cycle at a rhythm around 10 Hz. In addition, as can be seen in Figure 11, there was an increase in the amplitude of the performance oscillation starting around 300 milliseconds after the R-wave.

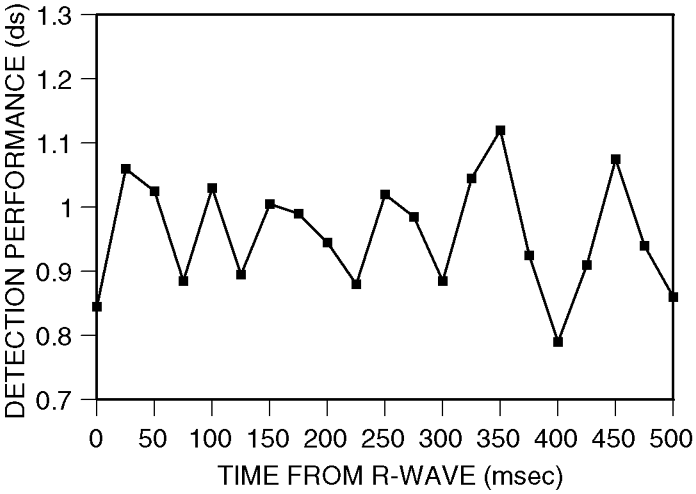

Figure 11. Performance over the cardiac cycle. By presenting a large number of performance tasks (detection of a masked audio stimulus) to subjects at differing times post R-wave, it was found that perceptual performance fluctuates with a frequency of about 10 Hz.[94] Figure shown with permission of C. Wölk and M. Velden.

The revised hypothesis proposes that the modulating influence of the activity of the mechanoreceptors on cortical function is not exerted directly, but rather is mediated via a synchronizing effect of the pulsating afferent input from the heart on cells in the thalamus, which in turn synchronizes the brain's cortical activity (Velden & Juris, 1975; Wölk & Velden, 1987, 1989). It has long been thought that alpha wave activity emerges from a state of cortical–thalamic resonance, evoked by afferent neural activity (Andersen & Andersen, 1968; Birbaumer, 1975). Wölk and Velden reasoned that as the observed oscillation in performance was in the same frequency range as the EEG alpha rhythm (~8–12 Hz), the afferent input from the heart was modulating the alpha rhythm.[21] This line of reasoning is consistent with the well-established finding that sensory-motor performance is dependent on the phase and amount of the alpha rhythm. Namely, higher levels of alpha activity are related to a decrease in performance; so also is the presentation of a stimulus during the higher-amplitude phase of the alpha rhythm (Callaway, 1962; Dustman & Beck, 1965; Nunn & Osselton, 1974; Rice & Hagstrom, 1989).[22] Thus, if the alpha rhythm was synchronized to the heart, then oscillations in performance should also be synchronized to the heart.

In Wölk and Velden's revised baroreceptor hypothesis, the periodic fluctuations in perceptual performance over the cardiac cycle are due to the alpha cycle effect (performance depends on the phase of the alpha cycle in which the stimulus is presented). This, in turn, is caused by neuronal activity evoked by cardiovascular afferent input at the level of the thalamus. They called this effect "cardiac driving," in analogy to "photic driving," where rhythmic stimulation with a visual stimulus induces an increase in EEG alpha activity. Wölk and Velden assumed that the amount of cardiac driving depends on heart rate. Thus, they inferred that a heart rate deceleration is effectively a modulation mechanism the organism uses to prevent the onset of synchronized alpha activity when attending to external sensory information, as this synchronized activity would interfere with the transmission and processing of the information. They conclude, "This means that the synchronized brain activity resulting from the baroreceptor stimulation does not just stand for a state of brain inhibition, but constitutes the mechanism by which perceptual performance can be modulated" (Wölk & Velden, 1989, p. 373).

One of Wölk and Velden's important revisions to the baroreceptor hypothesis is that it is *heart rate*, and not blood pressure, that is the relevant aspect of cardiovascular activity in terms of its synchronizing effect on thalamic cells and therefore on the cortex. In neurological terms, thus, it is the *pattern* and *stability* of the afferent input that is significant here, and not the strength or number of the neural bursts originating from the mechanoreceptors (Wölk & Velden, 1989). In this model, in situations involving the intake of sensory information, a decrease in heart rate translates into a reduction in the probability of the occurrence of EEG alpha activity.

---

[21] The observation that the brain's alpha rhythm is related to cardiovascular activity was first reported in 1955, when it was proposed that the transfer of mechanical energy from the contraction of the heart to the cerebrospinal fluid was a mechanism that may initiate and sustain synchronous brain activity (Bering, 1955; see also Kennedy, 1959). Sandman, Walker, and Berka (1982), who have extensively studied the influence of afferent cardiovascular feedback on the brain, published data in the early 1980s that supported this idea (Walker & Walker, 1983); however, the degree to which alpha activity is synchronized to the cardiac cycle still remained to be quantified.

[22] It was proposed in 1961 that the EEG alpha rhythm is a direct reflection of a relatively large homogenous area of cortex synchronously undergoing cycles of alternating excitations and inhibitions at the same frequency as the alpha rhythm. This was thought of as a "neuronic input shutter," which periodically prevents the perception and processing of information by the brain as elemental operations are switching on and off (Lindsley, 1961). Although this micro-rhythm clearly exists, the alpha rhythm also likely reflects a large-scale structural synchrony related to integrative brain functions, such as sensory, motor, and cognitive processes (Fingelkurts et al., 2003).

In essence, Wölk and Velden concluded that while the baroreceptor hypothesis in its original form is correct with respect to the modulating effect on sensory-motor performance by the heart, the underlying mechanisms proposed in the original version of the hypothesis were incorrect. Their findings explain why the results of previous studies were so variable and contradictory—on the basis of the original hypothesis, most researchers were expecting to find a performance rhythm of a much slower frequency, and thus they traced performance over time in steps far too large to detect a ~10 Hz oscillation (Wölk & Velden, 1987, p. 63).

Appendix C: Research on Coherence and Cognitive Performance

HeartMath Institute Research

To test our heart rhythm coherence hypothesis, we conducted a study that examined the effect of the psychophysiological coherence mode on cognitive performance. Thirty healthy individuals (13 males, 17 females; age range 26-52, mean age 44) previously screened for their ability to maintain psychophysiological coherence were randomly divided into matched experimental and control groups and stratified by age and gender. We monitored the participants' ECG, pulse transit time, and respiration continuously throughout the experiment. Heart rhythm coherence, derived from the ECG, was calculated for all subjects during each phase of the testing sequence. To determine cognitive performance, we measured participants' reaction times in an auditory discrimination task that requires focus and attention, accurate discrimination, and quick and accurate reactions.

Following a 10-minute baseline period, participants performed the first of two 10-minute auditory discrimination tasks. Then the experimental group was asked to use the Heart Lock-In emotional restructuring technique (Childre & Rozman, 2002) for a 10-minute period, while the control group was instructed to relax for 10 minutes without adopting a specific mental or emotional focus. Immediately following this, all participants performed a second 10-minute auditory discrimination task, the results of which were compared to the first. This enabled us to determine if changes occurred in cognitive performance in either of the two groups and if heart rhythm coherence was related to cognitive performance.

We found, first, that there was a significant increase in heart rhythm coherence ($p < 0.05$) in the experimental group who used the Heart Lock-In technique, but not in the relaxation control group. Furthermore, the experimental group demonstrated a mean decrease of 37 milliseconds in their reaction times—corresponding to a significant ($p < 0.05$) improvement in cognitive performance—whereas the control group showed no change (Figure 12). In addition, there was a significant relationship ($r^2 = 0.21$; $p = 0.015$) between the degree of heart rhythm coherence and performance (reaction time) across all subjects and conditions: increased coherence was associated with decreased reaction times (improved performance). Figure 13 shows a representative example of one participant's heart rhythms during each of the three conditions. Note the development of a more sine-wave-like (coherent) heart rhythm pattern during use of the Heart Lock-In technique. Also noticeable are differences in heart rhythms between the first and second auditory discrimination tasks.

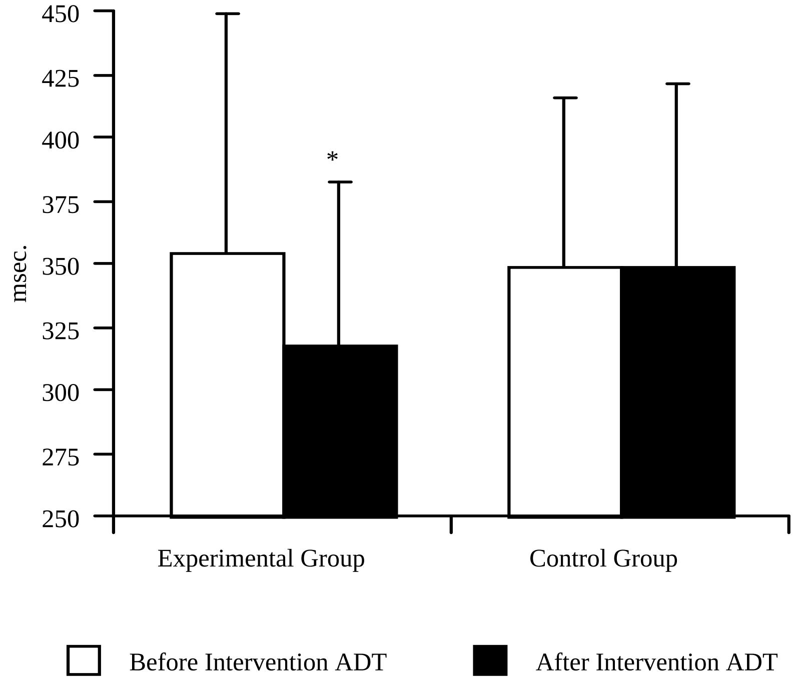

Figure 12. Reaction time changes. Mean reaction times for the experimental versus control group during the first (pre-intervention) and second (post-intervention) auditory discrimination tasks (ADT). The experimental group, who maintained the psychophysiological coherence mode prior to the second ADT, demonstrated a significant reduction in mean reaction time, indicative of improved cognitive performance. In contrast, control group participants, who engaged in an open-focus relaxation period during the interval between tests, showed virtually no change in mean reaction time from the first to the second discrimination task. *$p < 0.05$.

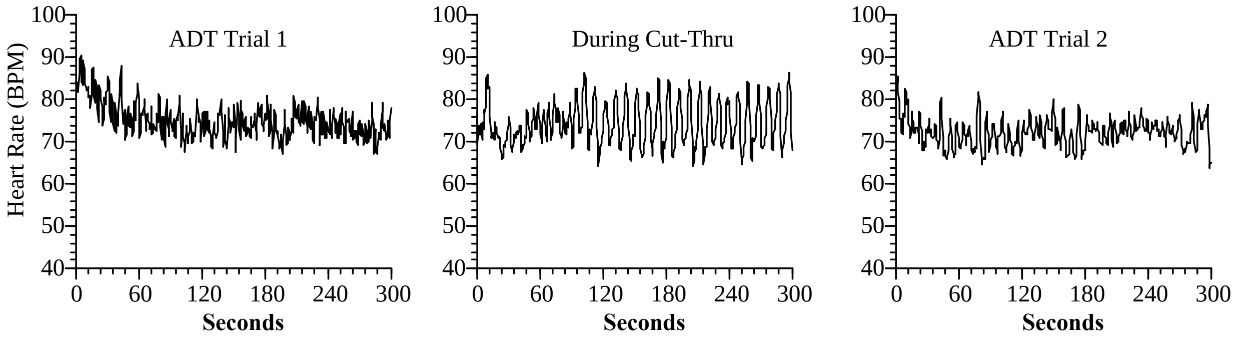

Figure 13. Representative example of heart rhythm pattern changes across conditions from an experimental group participant. Note the development of a coherent heart rhythm pattern during use of the Heart Lock-In technique. Also noticeable are the differences in heart rhythms during the first and second auditory discrimination tasks (ADT).

This experiment demonstrated that cognitive performance can be improved by maintaining psychophysiological coherence prior to a performing a task and that there appears to be a carry-over effect of the coherence mode on subsequent cognitive performance. Importantly, these findings suggest a physiological link between positive emotions and improvements in faculties such as motor skills, focused attention, and discrimination. More broadly, these results provide evidence for our hypothesis regarding the influence of macro-scale patterns of heart activity—specifically, heart rhythm coherence—on cognitive processes: they suggest that the *overall organization* of the heart's rhythmic activity, and thus the pattern of cardiac afferent input to the brain, can significantly inhibit or facilitate cortical function.

From the evidence provided by this study, it appears that macro-scale patterns of cardiac activity can produce a larger effect on the inhibition/facilitation of cognitive performance than the much smaller inhibition/facilitation fluctuations in performance observed by Wölk and Velden. As Wölk and Velden proposed, these smaller fluctuations in performance are likely related to the alpha rhythm, which in turn is driven by afferent input from the heart. A relationship between performance and the phase of the alpha cycle has been documented by a number of studies of both visual and auditory perception (Bradford, Wesnes, & Brett, 2005; Callaway, 1962; Childre & Cryer, 2000; Dustman & Beck, 1965; Nunn & Osselton, 1974; Rice & Hagstrom, 1989). For those studies that used a reaction-time protocol, the *maximum* reported magnitude of these small fluctuations in reaction time (i.e., the difference between fastest and slowest phases) was 6.3 milliseconds (Dustman & Beck). Compared to the results of these studies, our research found an approximately *six times* greater improvement in performance (a mean improvement of 37 milliseconds in reaction time) after the study participants maintained a state of psychophysiological coherence. It is thus likely that heart–brain interactions occurring on a much longer time scale have a markedly larger impact on cognitive performance and intentional behavior. Seen from this viewpoint, the small-magnitude fluctuations in performance observed by Wölk and Velden may reflect the ongoing background behavior of the system.

UK Research

Additional evidence consistent with the heart rhythm coherence hypothesis has been provided by an independent study conducted in the UK by Dr. Keith Wesnes at Cognitive Drug Research Ltd. (Wesnes, Ward, McGinty, & Petrini, 2000). To test the long-term effects of psychophysiological coherence on cognitive performance, Dr. Wesnes used a comprehensive battery of cognitive performance tests called the Cognitive Drug Research measurement system (CDR), designed to assess the effects of pharmaceuticals on cognitive function. The CDR system is a set of computer-based tasks that includes tests of attention, concentration, vigilance, short-term (working) memory and long-term (episodic) memory. This battery of tests has been used in clinical trials worldwide for over 20 years, and an extensive database of normal performance and drug placebo effects has been developed.

The study utilized an experimental design with pre and post measures. Eighteen healthy volunteers (6 females, 12 females; age range 20-53, mean age 32 years) were recruited for the study. The study participants were fully trained on the CDR system and completed four full runs through the assessment prior to the baseline data collection in order to ensure they understood the tasks and had overcome the learning process. To measure heart rate variability and heart rhythm coherence, each research participant's ECG was recorded for a 10-minute period *prior* to administration of the CDR test battery. In addition, participants completed a short self-administered questionnaire that measured calmness and alertness.

After collection of the baseline measures, the study participants attended a one-day training program where they learned the Freeze-Frame, Heart Lock-In, and Coherent Communication[23] techniques. They also practiced using these tools while facilitated by the Freeze-Framer, a computerized heart rhythm coherence biometric feedback system, to ensure they were making the shift into the coherence state and could identify what that state felt like. They were instructed to use the Freeze-Frame technique whenever they experienced stress or emotional discord, and to use the Heart Lock-In technique three times per week for at least 10 minutes. In addition, they were encouraged to practice using the Coherent Communication technique when engaged in conversation with others.

Seven weeks later the research participants were again administered a 10-minute ECG, answered the questionnaire, and completed the CDR battery of tests using exactly the same protocol as was followed for baseline data collection.

For data analysis, the standard time and frequency domain HRV measures and coherence levels were computed. The pre and post results are shown in Table 1 and Figure 14. In relation to baseline measurement, a significant increase in heart rhythm coherence (Coherence: *t*-test 4.00, $p < 0.001$) was observed post-intervention before the participants were administered the CDR tests. This change is graphically depicted in Figure 14 (showing the group mean HRV power spectra), where the increase in power around the 0.1 Hz frequency range indicates a pronounced increase in heart rhythm coherence. It is worth noting that this increase in heart rhythm coherence occurred even though the participants were not specifically instructed to use any of the tools they had learned in the program.

---

[23] This technique incorporates a process whereby individuals maintain a state of coherence while listening to others in order to increase the effectiveness of communication (Lansing, 1957).

Table 1. CDR Cognitive Performance Study: Pre and Post Results

	Before (N=18)			After (N=18)				
	Mean	SD	SEM	Mean	SD	SEM	t	*p* <

Paired T-Test

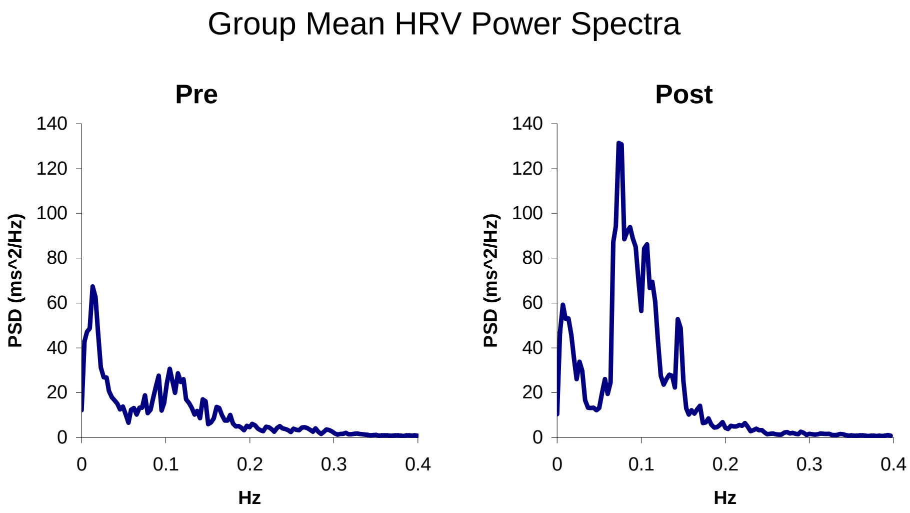

Figure 14. Group mean HRV power spectra calculated from 10-minute ECGs recorded before subjects completed the battery of cognitive performance tasks. The left-hand graph shows the mean HRV power spectrum *before* subjects were trained in the HeartMath coherence-building techniques, while the right-hand graph shows the mean power spectrum *after* they learned and practiced the techniques for seven weeks. Note the increase in power around the 0.1 Hz frequency range, indicating a pronounced increase in heart rhythm coherence. This shift is particularly notable, as subjects were not specifically instructed to use the techniques during the "post" recording.

The results of the pre and post analysis of the cognitive performance tests showed a significant improvement ($p = 0.0049$) in the quality of episodic (long-term) memory and a marginally significant improvement ($p = 0.078$) in the quality of working (short-term) memory (Figure 15).[24] [25] Analysis of the questionnaire data also showed that the research subjects reported feeling significantly calmer at the end of the study than they did at the beginning (t-test 2.44, $p < 0.05$).

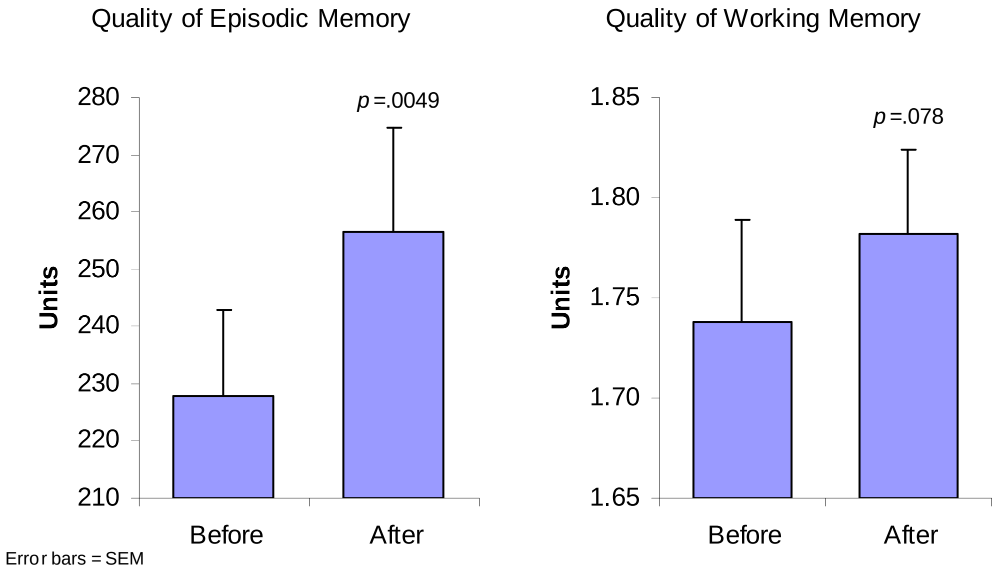

Figure 15. Mean improvements in quality of episodic (long-term) memory and quality of working (short-term) memory after practicing the HeartMath coherence-building tools for a 7-week period.

The finding of the observed gain of 12.6% in the quality of long-term memory over the 7-week period during which coherence-building techniques were practiced is notable, in that Dr. Wesnes reports the magnitude of improvement was significantly higher than the improvement in quality of memory obtained in a large clinical 14-week trial of the effects of a phytopharmaceutical memory enhancer (a gingko/ginseng combination) on the memory of healthy volunteers (Wesnes et al., 2000).

In an effort to explain the observed pre-post changes in the quality of episodic memory and in self-rated calmness, two stepwise multiple regressions were run. Of the ten independent variables included in each analysis, improvement in coherence was the only variable with sufficient statistical power to meet the criterion for entry into the stepwise analysis (p of F to enter = 0.05;

---

[24] Quality of Episodic Memory is a composite measure constructed from accuracy measures on the four tests in the CDR system that assess episodic memory. Quality of Working Memory is a composite measure constructed from accuracy measures on the two CDR system tests that assess working memory.

[25] Also observed was a positive trend in the composite scores reflecting the ability of the participants to pay attention and the speed with which they were able to retrieve information from memory. However, the improvements in these measures did not reach statistical significance.

p of F to remove = 0.10).[26] The results show that the change in coherence is quite strongly related to the observed changes in episodic memory and calmness: it accounts for 21% of the variance in the improvement in long-term memory ($F = 5.4$, $p < 0.05$; adj. $R^2 = 0.21$), and it accounts for 42% of the variance in the reported increase in calmness ($F = 13.18$, $p < 0.01$; adj. $R^2 = 0.42$).

In his review of the study's results, Dr. Wesnes concluded that learning and practicing the HeartMath positive emotion-focused coherence-building techniques appears to enhance an individual's memory capacity and also improves self-reported calmness. Moreover, he was able to show that the improvements were unlikely to be due to training or expectation effects, and that they compare favourably to the improvements produced by a proven phytopharmaceutical preparation.

HeartMath's TestEdge Program on Test Anxiety and Performance

Further support for the heart rhythm coherence hypothesis comes from a controlled field study, funded by U.S. Department of Education, involving tenth grade students in two large California high schools. Conducted by the Institute of HeartMath in collaboration with Claremont Graduate University's School of Educational Studies in 2004-2006, the study was designed to assess the efficacy of HeartMath's TestEdge program as a means of reducing student test anxiety and improving learning and test performance. The TestEdge program is designed to help students alleviate emotional stress and improve performance by teaching them tools enabling them to stabilize emotions and generate the psychophysiological coherence state. The program instructs students in how to apply HeartMath coherence-building tools and technologies in test preparation, to increase retention and relevance of academic material, and to more effectively handle stress and challenges, both at school and at home.

After random selection of the intervention school, the experimental protocol required training the school's tenth grade teachers in the tools and techniques of the TestEdge program before classes started. Once school began, the teachers trained and coached their students in the coherence-building techniques throughout the term. The Freeze-Framer heart rhythm coherence feedback system was used to facilitate students' practice of the techniques and to verify their attainment of the coherence state. Students practiced using the tools during stressful situations, such as prior to taking tests or when learning new or difficult subject matter, before taking the California High School Exit Exam (CAHSEE) midway through the term and the California Standards Test (CST) at the end of the school term.

Scores from the two standardized tests, and pre and post data from an instrument designed to measure student sociodemographic characteristics, attitudes about school, perceptions of feelings, emotions, relationships, and test anxiety (using an eight-item version of the Spielberger Test Anxiety Inventory) were collected from 749 tenth grade students across both schools.

---

[26] Excluded variables were Change in: Systolic Blood Pressure, Mean RR Interval, Standard Deviation of RR Intervals, Ln(5-min High Frequency), Ln(5-min Low Frequency), Ln(5-min Very Low Frequency), Ln(5-min Total Power), Ln(Low Frequency / High Frequency Ratio) and Baseline Age.

Additionally, to assess students' ability to generate the coherence state using the techniques learned in the program, an electrophysiological study was conducted in which pre- and post-intervention recordings of HRV were obtained from a subgroup of students in both schools.

Figure 16 shows, for the whole sample, the relationship between baseline test anxiety and the CAHSEE Math and English-Language Arts test scores. Clearly apparent is the inverse relationship between stress and academic performance, as measured by the Test Anxiety Inventory (TAI) and the two standardized tests.

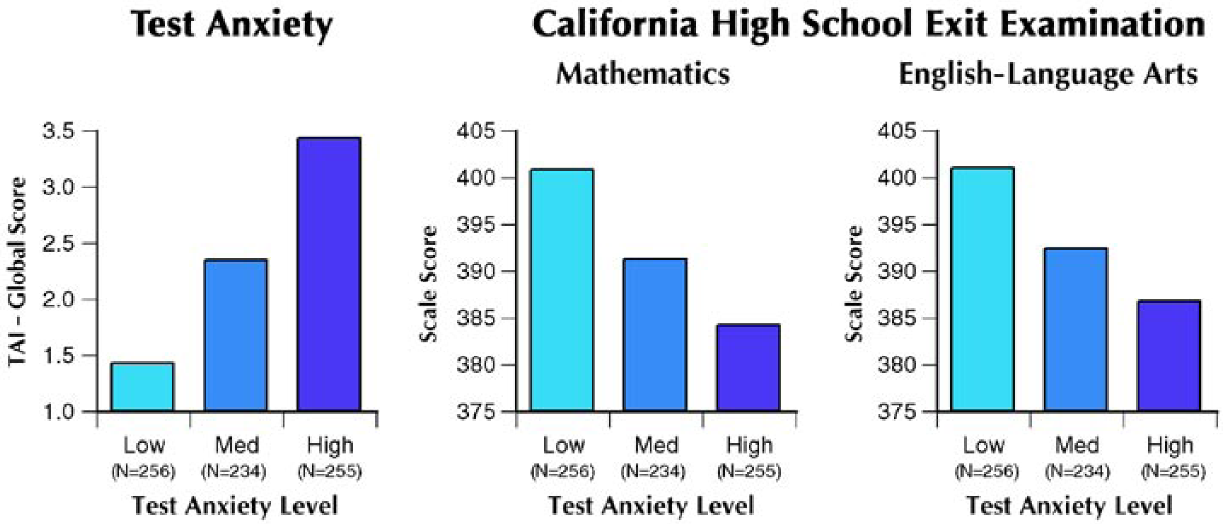

Figure 16. California High School Exit Exam scores by baseline test anxiety level. Baseline test anxiety, measured by the Test Anxiety Inventory (TAI)-Global Scale score, and mid-term CAHSEE–Mathematics and CAHSEE–English-Language Arts scores have each been classified into approximately equal-size tertile groupings of students with low, medium, and high mean scores. A strong, statistically significant ($p < 0.001$), negative relationship is clearly apparent between test anxiety level and level of performance on the two standardized tests.

Results from an analysis of a subsample of students at the end of the study present quite a different picture following the HeartMath intervention (see Figure 17). Students were matched by their ninth grade CST Math test type and were selected from classes in the two schools with similar class average scores. An ANCOVA was then performed to control for baseline differences between the schools on the dependent variable—test performance. The post-intervention mean tenth grade CST Math test score for the students in both schools was closely matched (359.71 versus 360.58, $p = 0.891$, not significantly different). What is notable, when intellectual ability is controlled in this way, is that the post-intervention mean test score in tenth grade CST English-Language Arts is significantly higher for the intervention school—by a margin of approximately 10 points—than it is for the control school (413.44 versus 402.96, $p = 0.035$). Moreover, this improvement in test performance is associated with a significant reduction of test anxiety in the intervention school relative to the control school (1.99 versus 2.22, $p < 0.05$).

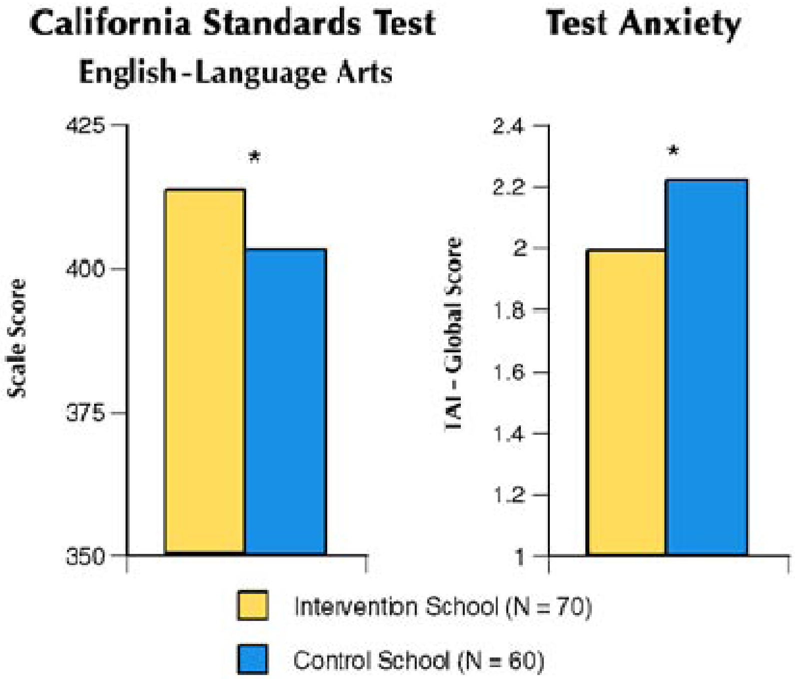

Figure 17. Test anxiety and California Standards Test scores by intervention status. Data from a subsample of students (matched on ninth grade CST–Mathematics test type and selected from classes with comparable mean scores), showing post-intervention results from an ANCOVA in which means have been adjusted for baseline differences. $^*p < 0.05$.

However, a key question of inference, in interpreting these results, concerns the degree to which the HeartMath intervention actually resulted in the expected physiological changes in heart rhythm coherence in students, and the degree to which coherence is associated with their self-reports of reduced test anxiety over the course of the study. Corroborating evidence comes from the electrophysiological sub-study involving a random sample of students from both schools, stratified by test anxiety level and gender. In this sub-study, to simulate a stressful testing situation, students completed an experimental procedure that included a computerized version of the Stroop color-word conflict test (a standard protocol used to induce psychological stress), while continuous HRV recordings were gathered. During the pre-intervention administration, students were asked to prepare themselves to take the test using whatever methods they typically used when preparing to perform a challenging test or activity. In the post-intervention session, students in the intervention group were instructed to use one of the positive emotion-focused coherence-building techniques they had learned in the TestEdge program to ready themselves for the test, while the control group students again used their own methods. This was done in an effort to document, with objective electrophysiological measures, that students in the intervention school had learned how to self-induce the coherence state prior to taking a stressful test.

Results reveal a significant increase in heart rhythm coherence for students in the intervention school, indicating they were less stressed, which is consistent with the expected outcome. Overall, the results from the physiological study present compelling objective evidence that the students in the experimental group had learned how to shift into the coherent state and better manage their emotions when preparing for a stressful task or situation, such as taking an important test.

Beginning with an analysis of pre-intervention recordings, we found no significant differences between the two schools—either during the baseline resting period or during the stress preparation period. We then performed an ANCOVA in which post-intervention heart rhythm coherence was defined as the dependent variable and pre-intervention heart rhythm coherence was defined as the covariate; intervention status was designated as the fixed factor. We found a significant difference ($p < 0.001$) in post-intervention heart rhythm coherence between the two groups of students during the test preparation phase of the protocol. As graphically depicted in Figure 18, a notable increase in mean heart rhythm coherence is observed in the intervention group (3.26 pre-intervention, 4.53 post-intervention), whereas a reduction is evident in the control group (3.16 and 2.83, respectively). The intervention group in this sub-study also registered a significant pre–post reduction in test anxiety as compared to the control group (1.98 versus 2.27, $p < 0.01$).

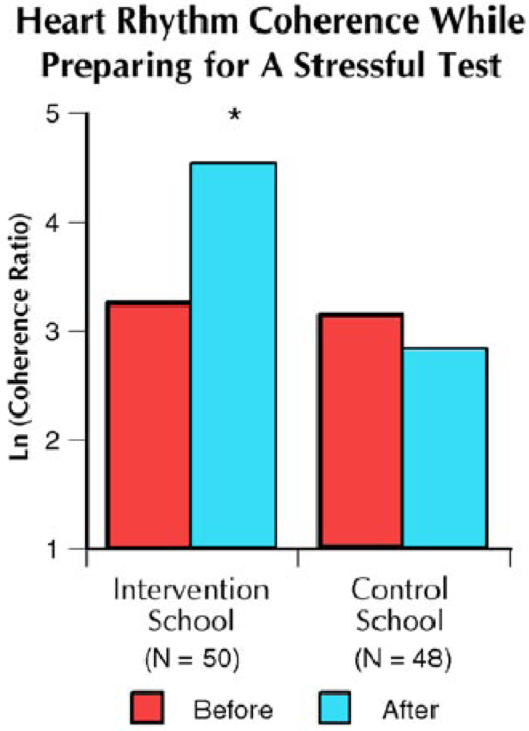

Figure 18. Heart rhythm coherence while preparing for a stressful test. Data are shown from the electrophysiological sub-study, in which a stratified random sample of students from the intervention and control schools was administered the Stroop stress test in a controlled experiment, while heart rate variability was continuously recorded. These graphs quantify heart rhythm coherence during the stress preparation phase of the protocol, before and after the TestEdge intervention. The intervention group demonstrated a significant increase in heart rhythm coherence in the post-intervention recording, when they used a HeartMath positive emotion-focused technique to prepare for the stressful test, as compared to the control group, who used their own usual stress preparation methods. *$p < 0.05$.

Figure 19 presents examples of typical patterns observed in the HRV recordings collected during the stress preparation phase of the electrophysiological sub-study, pre- and post-intervention. Shown are examples from four students (two from the intervention group and two from the control group), who are also in the subsample matched on ninth grade CST Math test type. Pre- and post-intervention test anxiety and CST–English-Language Arts test score data are also shown for each student. For the students in the intervention school, the pre-intervention HRV pattern while preparing to take the Stroop stress test is highly erratic and irregular, suggesting an enduring state of psychophysiological incoherence. However, in these students' post-intervention HRV recordings, a marked shift to increased heart rhythm coherence in the stress preparation period is readily apparent. This suggests that students were able to self-generate a state of psychophysiological coherence by applying the positive emotion-focused technique to prepare for a stressful test. By contrast, both the pre and post HRV recordings for the students in the control school signify an ongoing incoherent psychophysiological state during the stress preparation phase. Interestingly, these examples also show that the students who learned to generate psychophysiological coherence demonstrated a corresponding reduction in test anxiety and an increase in academic test scores, while the control group students experienced an increase in test anxiety and reduced academic test performance.

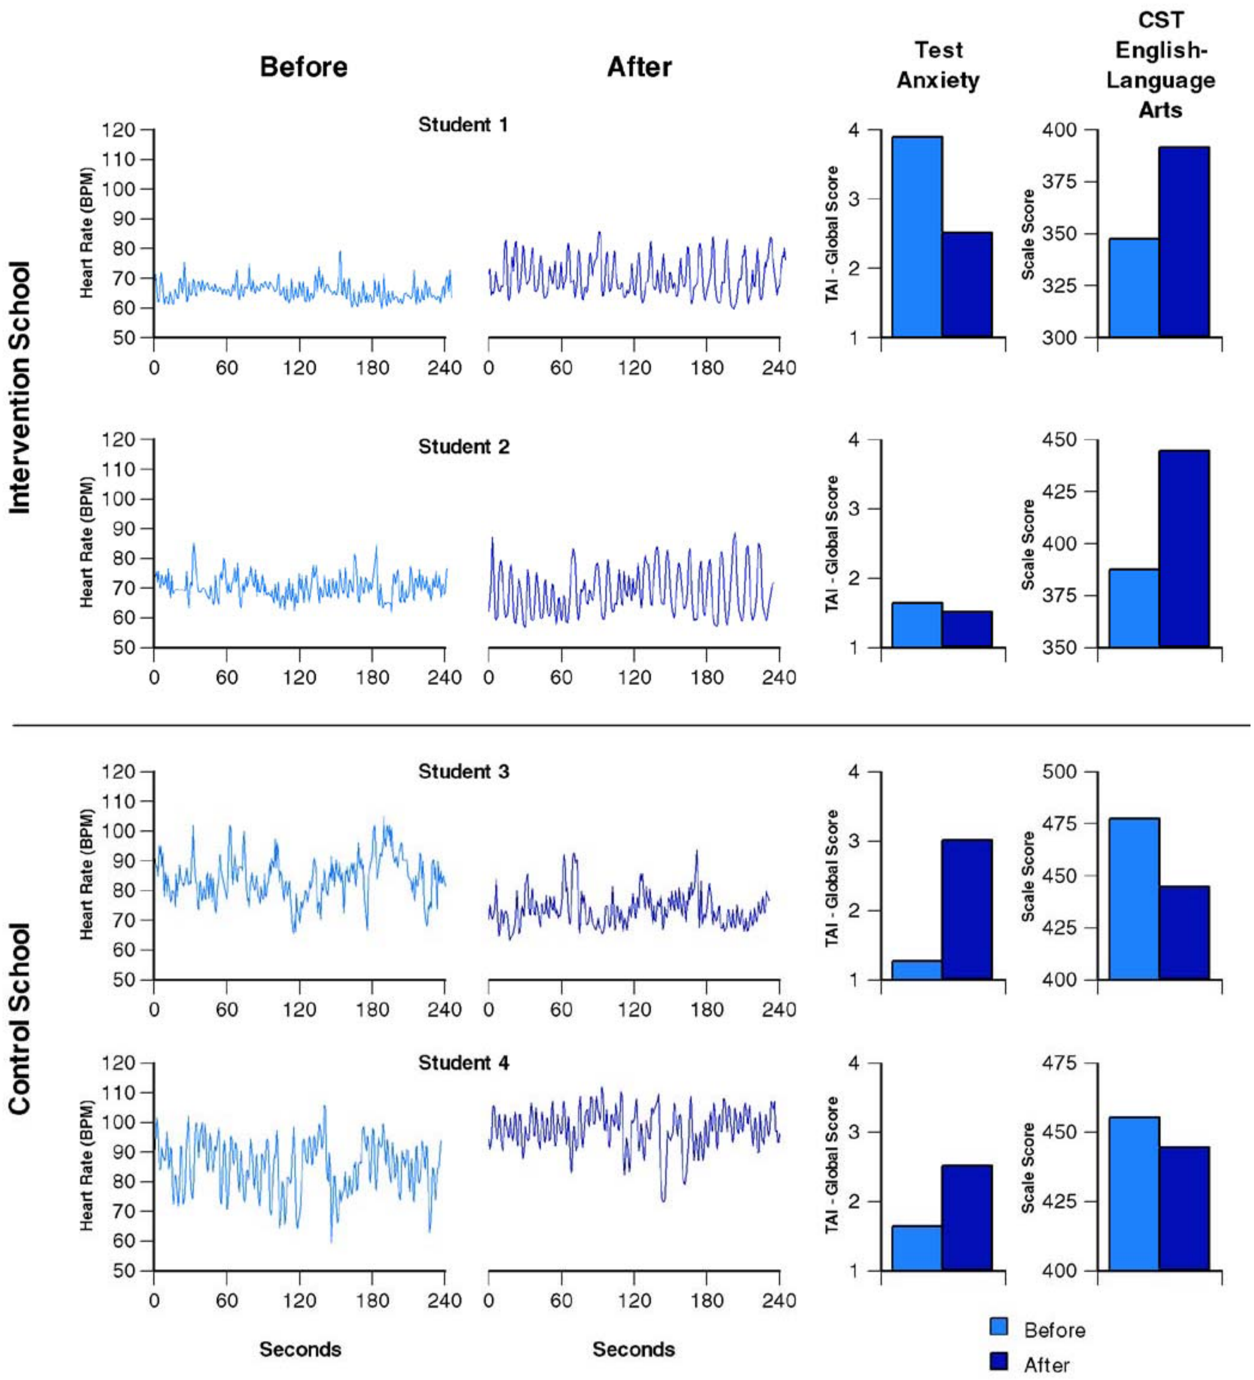

Figure 19. Typical heart rate variability patterns in students preparing for a stressful test. HRV recordings from the electrophysiological study, showing four students' heart rhythm patterns while they prepared themselves for the Stroop stress test, both before and after the TestEdge intervention. Pre- and post-intervention test anxiety level (TAI-Global Scale score) and the CST–English Language Arts test score for each student are also shown. For the two students in the intervention school, the recordings show a shift from an erratic, irregular heart rhythm pattern (left-hand side), signaling a state of psychophysiological incoherence before the intervention, to a sustained sine-wave-like pattern (increased heart rhythm coherence), indicative of the psychophysiological coherence state after the intervention. By contrast, both the pre and

post HRV recordings for the two students in the control school signify an ongoing incoherent psychophysiological state.

In sum, the results show that high school students can be trained to self-generate heart rhythm coherence and that they are able to effectively apply this skill prior to taking a challenging or stressful test. The data suggest that when students self-manage their stress using coherence-building methods, it enables them to achieve both a significant reduction in testing-related anxiety and a corresponding improvement in standardized test scores—a real-world measure of cognitive performance.

Appendix D: Heart Brain Synchronization

As noted in our earlier discussion, central to Wölk and Velden's hypothesis regarding the heart's influence on cognitive performance is a key untested postulate: that the brain's alpha rhythm is synchronized to the cardiac cycle. Independently of Wölk and Velden's work, we had been pursuing the question of the synchronization of heart and brain activity, which, so far as we know, had not been previously quantified. Here we present evidence from two studies conducted in our laboratory which confirm that a significant amount of alpha rhythm activity is indeed synchronized to the activity of the heart. The findings from these studies confirm Wölk and Velden's ideas and offer further evidence that broadens the understanding of heart–brain synchronization.

In our research we used heartbeat evoked potential analysis to examine the distribution of EEG activity that is synchronized to the cardiac cycle. Heartbeat evoked potential analysis involves the use of signal averaging techniques[27] to trace the flow and processing of afferent neurological signals from the heart through the different regions of the brain. The resulting waveforms, which represent EEG (brain) activity that is time-locked to the ECG (heart activity), are called *heartbeat evoked potentials.* The peak of the ECG R-wave is used as the timing source for the signal averaging process. An example is depicted in Figure 20. Here, in each of the EEG signal averaged waveforms, a peak can be seen that is aligned with the R-wave of the ECG. This peak reflects energetic and volume conduction mechanisms, while the later potentials reflect the processing of the afferent signals and the effects of the blood pressure wave reaching the different areas of the brain.

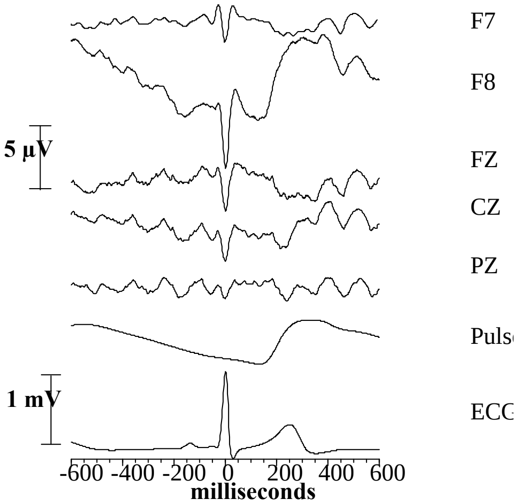

Figure 20. Heartbeat evoked potentials. This figure shows an example of typical heartbeat evoked potential waveforms along the medial line of the scalp (Fz, Cz, and Pz) and the frontal

area (F7 and F8). The electromagnetic and volume conduction effects of the electrical activity of the heart can clearly be seen in the waveforms (large negative-going peaks occurring exactly in sync with the ECG R-wave). In this example, there is less synchronized activity in the brain potentials immediately after the ECG R-wave, indicating the processing of afferent information. The pulse wave is also shown, indicating when the blood pressure wave reached the brain. Increased alpha synchronization can be clearly seen later in the waveforms, around 250 milliseconds post R-wave, which is the time the blood pressure wave reaches the brain.

---

[27] Signal averaging is a technique for detecting patterns in biological and bioelectromagnetic phenomena. This is accomplished by superimposing any number of equal-length epochs, each of which contains a repeating periodic signal. This procedure distinguishes any signal that is time-locked to the periodic signal while eliminating variations that are not time-locked to the periodic signal.

In the first study, the ratio of alpha–ECG synchronization was compared at baseline and during the psychophysiological coherence mode in ten participants. EEG recordings using electrodes along the midline (Oz, Pz, Cz, Fz) and the lateral frontal sites (F7, F8) were obtained from the research participants. Heartbeat evoked potentials were obtained using a 200-sweep-wide window that was moved across the first 10 minutes of the recording for each condition for each participant. Figure 21 shows an example of one heartbeat evoked potential waveform with the presence of the alpha rhythm. The two time intervals between 50-250 milliseconds (period 1) and 250-600 milliseconds (period 2) post R-wave were each subjected to a separate spectral analysis in which the spectral amplitude in the 8–12 Hz region was calculated for each sweep average.

The first period of the heartbeat evoked potential (50-250 milliseconds post R-wave) is the time interval when afferent signals from the heart reach the lower brain areas. It was observed that there were substantial individual differences between participants in this region. The main difference appeared to be that in about half the participants there was a desynchronization of the alpha rhythm, indicating an increase in the processing of the afferent information, while in others there was increased alpha synchronization.

The second period of the heartbeat evoked potential (250-600 milliseconds post R-wave) is believed to reflect the higher cognitive centers' processing of the sensory input and is also within the time interval when the blood pressure wave reaches the brain. Substantial individual differences were observed in this period as well. The main differences were in the later part of the evoked potentials and were observed primarily in the frontal regions of the brain. In the lower brain regions, the arrival of the blood pressure wave appears to mask the processing of some of the cardiovascular afferent information. This masking is a result of the impact of the arrival of the blood pressure wave having an additional effect on synchronizing brain activity to the heart. Therefore, the 250–600 millisecond region of the evoked potential appears to primarily reflect synchronized activity due to biophysical interaction of the blood pressure wave with the brain. This finding clearly supports Wölk and Velden's hypothesis and it is consistent with their findings of an increase in the amplitude of the performance oscillations starting around 300 milliseconds after the R-wave (see Figure 11).

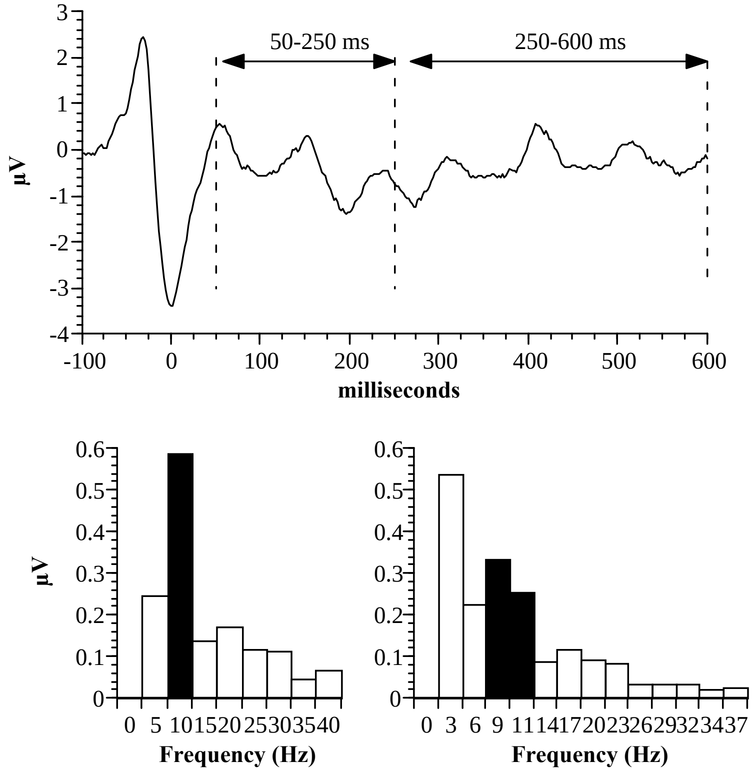

Figure 21. Quantification of alpha rhythm–ECG synchronization. In order to quantify the amount of alpha activity that is synchronized to the heart, a spectral analysis of the heartbeat evoked potential waveforms is performed. In this example the waveform is divided into two segments that represent different physiological mechanisms. The segment between 50–250 milliseconds reflects the processing of afferent signals, while the segment between 250–600 milliseconds reflects a combination of afferent processing and effects of the blood pressure wave reaching the brain.

Because of the prevalence of the alpha rhythm in EEG recordings, in determining the degree of alpha–ECG synchronization it is important to distinguish measurement of alpha activity that is truly synchronized to the cardiac cycle and spurious measurement in which alpha activity is only coincidentally synchronized to the heart. To control for the effects of this potential measurement artifact, the same procedure described above was repeated using the same ECG as the signal source, but with the interbeat intervals randomized.

As shown in Figure 22, there was significantly more alpha rhythm synchronization when the actual interbeat intervals were used for the signal source as compared to the randomized controls. This finding, too, is consistent with the idea underlying Wölk and Velden’s postulate.

In addition to the alpha–ECG synchronization observed, this study found that a significant amount of lower frequency brain activity (< 8 Hz) was also synchronized to the cardiac cycle (Figure 23).[28]

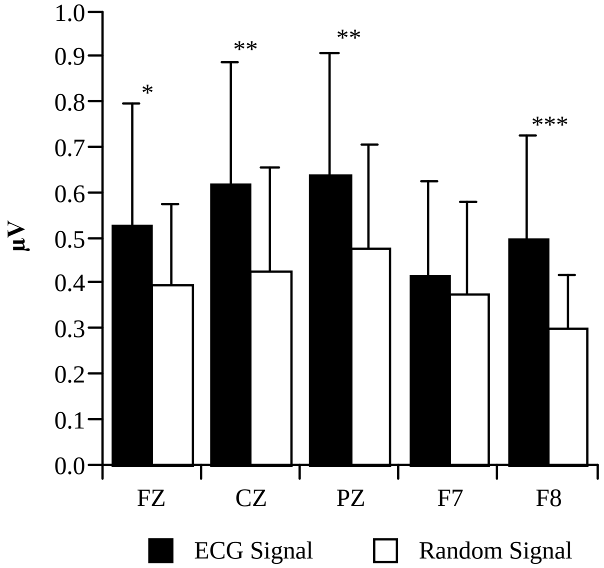

Figure 22. Alpha rhythm–ECG synchronization. This figure shows the alpha band spectral magnitude derived from the heartbeat evoked potential waveforms at different EEG sites in the range from 50–600 milliseconds post R-wave. It also compares the spectral magnitude of the real ECG as the signal source to a randomized control signal having the same mean interbeat interval and standard deviation as the original ECG signal. *$p < 0.05$, **$p < 0.01$, ***$p < 0.001$.

---

[28] Because the time window in the EEG record post R-wave is only 600 milliseconds long, there is not enough time to adequately resolve these lower frequencies with spectral analysis. However, the amount of synchronized activity in the EEG at these lower frequencies can be quantified by comparing the standard deviations of the evoked potential waveforms to those of the randomly generated control signals.

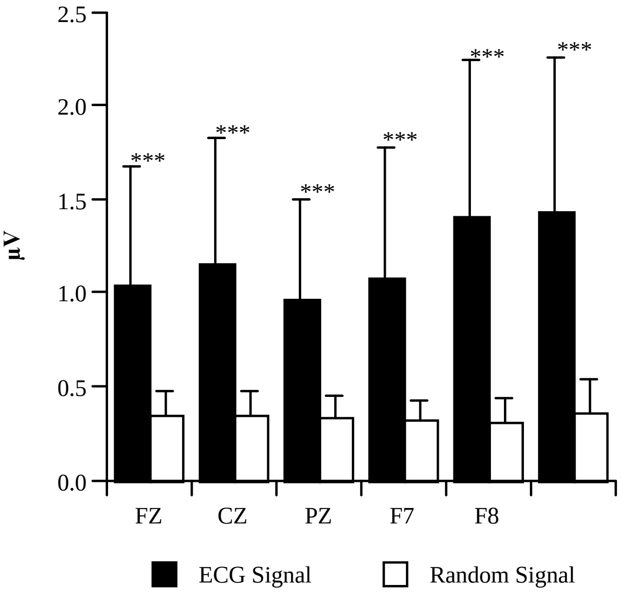

Figure 23. Low frequency synchronization. The standard deviation of the evoked potential waveforms in the range between 50–600 milliseconds was used to quantify the lower-frequency activity in the EEG that is synchronized to the cardiac cycle. The ECG and a randomized control signal for dividing the signals into segments were compared. There was a significant difference at all EEG sites, with the ECG signal resulting in higher standard deviation values. This indicates a significant synchronization of low frequency brain activity to the heart. ***$p < 0.001$.

Given our previous findings on the effect of psychophysiological coherence in increasing the synchronization among multiple body systems, we wondered whether this mode was also related to a change in heart–brain synchronization—specifically if ECG–alpha synchronization would increase as well. To determine if the ratio of ECG–alpha synchronization increased when participants were in the psychophysiological coherence mode, the study participants were asked to use the Heart Lock-In technique for 10 minutes after a 10-minute baseline period had been recorded. The degree of heart rhythm coherence and the alpha rhythm magnitude in the heartbeat evoked potentials during these two conditions were then compared.

During the period that the subjects used the Heart Lock-In technique, significant increases in heart rhythm coherence and in ECG–alpha synchronization were observed, as shown in Figure 24. Under this condition, there were significant increases in synchronized alpha activity at most sites in the range between 50–250 milliseconds, while in the 250–600 millisecond range there was a significant increase only at the Fz (midline frontal) location.

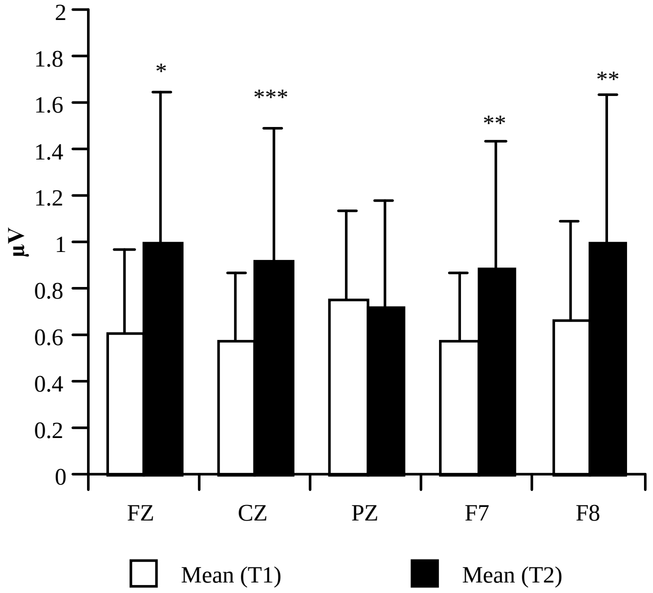

Figure 24. Increase in alpha rhythm–ECG synchronization during heart rhythm coherence. There was a significant increase in alpha wave synchronization to the ECG in the 50–250 millisecond region at most EEG sites during the use of the Heart Lock-In technique (high heart rhythm coherence). T1 = resting baseline; T2 = during heart rhythm coherence. $*p < 0.05$, $**p < 0.01$, $***p < 0.001$.

In a second study we recorded 19 channels of the EEG from 30 participants, who were measured in both baseline and psychophysiological coherence modes. The research participants used the Heart Lock-In technique to enter the psychophysiological coherence mode by self-generating feelings of appreciation as they listened to music designed to foster positive emotions (Childre, 1991). Relative to baseline values, we found both a significant increase in heart rhythm coherence in the psychophysiological coherence condition and also a significant increase in the percentage of ECG–alpha synchronization in the left hemisphere, centered around the temporal lobe.

Figure 25 shows the whole group mean topographical maps of the percentage of alpha activity that was synchronized to the heartbeat during the resting baseline and coherence modes. The plots are controlled for total amount of alpha activity (synchronized alpha/total alpha), which did not change significantly, and show only the amount of synchronized activity. As can be seen, the areas with the highest degree of synchronization shift from the right frontal area during the baseline period to the left hemisphere, centered around the temporal area and radiating outward from there during coherence. While this change was most pronounced at EEG site T3 (left temporal area), the activity at adjacent sites was also significantly more synchronized to the heart during the psychophysiological coherence mode.[29]

---

[29] It is of interest to note that these observations are related to findings indicating that increased left hemisphere activity is associated with happiness and euphoria (Ahern & Schwartz, 1985; Canli et al., 1998; Davidson, 1992). It is clear that both the right and left hemispheres are involved in the processing

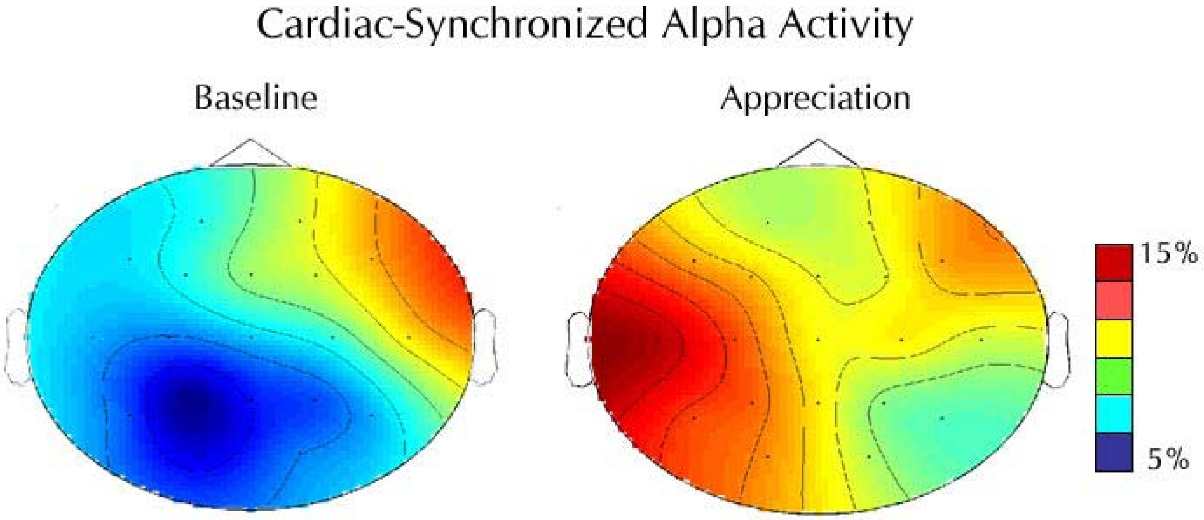

Figure 25. Alpha activity synchronized to the cardiac cycle. Group mean topographical maps for 30 subjects, showing the percentage of alpha activity in different regions of the brain that is synchronized to the heartbeat during a resting baseline as compared to during actively feeling appreciation (psychophysiological coherence mode).

To determine if there were gender differences in the amount and distribution of the EEG activity synchronized to the heart, we performed an analysis of baseline data by gender for both the alpha and beta rhythms. Figure 26 is a topographic map showing the magnitude and distribution of the alpha rhythm synchronized to the heart over the entire scalp for both males and females under baseline conditions. The females have more synchronized alpha activity in the frontal areas, while the males have more synchronized alpha in the parietal areas. Figure 27 shows the data from the same participants for the beta rhythm. The data from the beta rhythm analysis also shows a distinctive distribution pattern of synchronized activity to the heart. The females in this sample had significantly more background beta activity than the males, and, as can be seen in the topographic maps, the beta rhythm is more synchronized in the frontal regions.

Appendix E: Energetic Signatures of Psychophysiological Modes

Figures 28 through 33 show waterfall plots of consecutive amplitude spectra from the ECG data used to produce the examples of the six different psychophysiological modes described at the outset of this article: Mental Focus, Psychophysiological Incoherence (anger), Relaxation, Psychophysiological Coherence (appreciation), Extreme Negative Emotion (intense anger), and Emotional Quiescence. Each trace in the waterfall plots is the spectrum of the actual electrocardiogram recording of an individual over a 6-second period. (These spectra should not be confused with the power spectra of the HRV waveforms, such as those shown earlier in this article.) Together, the set of traces recorded cover a continuous time period (approximately 2 ½ minutes) and show the degree of stability in the structure of the waves of electrical activity generated by the heart during this time. As can be seen, although there are commonalities across the modes, there are also *distinctive spectral patterns* associated with each specific mode.

There is a direct relationship between the heart rhythm patterns (HRV) and the spectral information encoded in these radiating fields. This is due to the fact that the distribution of the harmonic relationships and magnitudes of the various peaks in the ECG spectrum are dependent on the length of the interbeat intervals (the temporal space between consecutive heartbeat spikes) and the distribution pattern of the interbeat intervals within the heart rate series (heart rhythm patterns). This relationship between the heart rhythm pattern and the ECG spectral patterns will be discussed in more detail as we describe the energetic signature of each psychophysiological mode.

The waterfall plots of the ECG spectra shown in Figures 28 through 33 were all derived from the same recordings of ECG signals that were used to measure the heart rhythms and the HRV spectra of those heart rhythms shown in Figure 8. Our interest in reviewing these spectra is to highlight the distinctive energetic features of each mode. For certain modes these features are readily apparent, while for others they are more subtle.

Mental Focus

Figure 28 shows the waterfall plot of the ECG spectra for the Mental Focus mode. Referring back to Figure 8, the heart rhythm pattern for this mode showed an overall suppression of HRV, with a slight increase in heart rate over the session. The lowered HRV produces an ECG spectrum that has a series of harmonics extending out to approximately 25 Hz. The lower the HRV (that is, the more uniform the time interval between each consecutive heartbeat), the more standing waves emerge and are organized in a harmonic order in the ECG spectrum (see Extreme Negative Emotion and Emotional Quiescence for examples). There are also two sets of peaks that occur in most of the individual spectra in the range of 3–5 Hz and 7–8 Hz. These peaks are due to the low frequency rhythm (~10-second rhythm) that occurs in the heart rhythm pattern. The presence of this rhythm during the Mental Focus mode can be seen in the HRV spectrum shown in Figure 8. However, it is not as prominent as it is in the Relaxation mode, nor is it the main rhythm, as in the Coherence mode (appreciation).

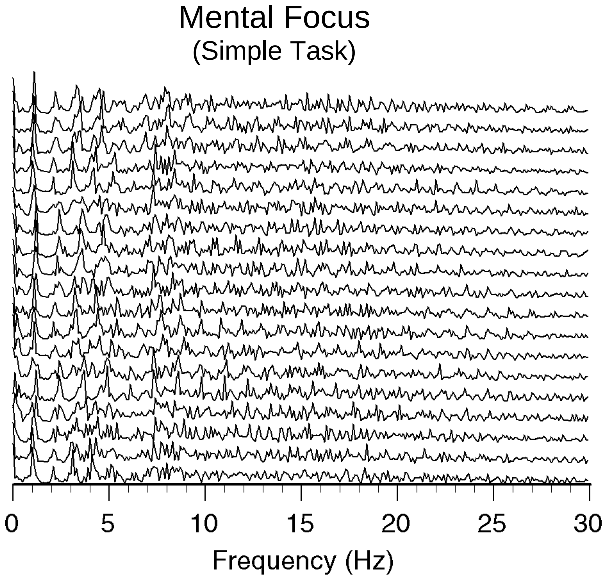

Figure 28. Waterfall plot of ECG spectra for the Mental Focus mode. Relative to a “normal” waking state, there is less amplitude in the spectral peaks during Mental Focus due to the reduced HRV in this mode; yet a stable structure of standing waves and harmonics is maintained throughout the consecutive spectra.

Psychophysiological Incoherence

Figures 29 and 30 show the waterfall plots of the ECG spectra for an individual’s experience of two distinct levels of anger, which are examples of the Psychophysiological Incoherence mode and the hyper-state associated with the Extreme Negative Emotion mode, respectively. In this case we are using a single individual’s experience of anger to show how the activation of extreme negative emotion (negative hyper-state) is differentiated from ordinary anger (incoherence). Thus, the ECG spectra are shown for two different segments in a single heart rhythm trace that represent the two modes, each of which is described separately in our discussion here. (The full heart rhythm trace is shown in Figure 10.)

Figure 29 shows the ECG spectra for the first part of the heart rhythm data displayed in Figure 10 (approximately 6–11 minutes), representing the Psychophysiological Incoherence mode. It is evident that the ECG spectra do not exhibit a coherent pattern from one trace to the next, nor do they display the harmonic pattern of waves seen in most of the other examples of the different modes. Therefore, when the heart rhythm is incoherent, so are the spectral patterns in the ECG.

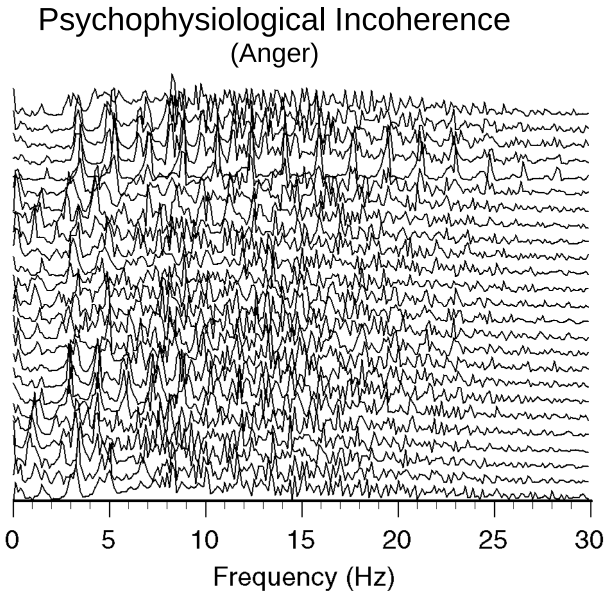

Figure 29. Waterfall plot of ECG spectra for the Psychophysiological Incoherence mode. In this example, anger is used to illustrate the mode, although most negative emotions also lead to incoherence. Note the lack of a coherent structure from spectrum to spectrum and the absence of harmonics in the spectra.

Extreme Negative Emotion

Figure 30 displays the ECG spectra for the heart rhythm data beginning around 15 minutes in the anger trace in Figure 10, where the HRV trace can be seen to flatten out (low HRV). This segment represents the Extreme Negative Emotion mode. As discussed earlier, most negative emotions produce increased incoherence in the heart rhythms—that is, the pattern of heart activity becomes more erratic. However, anger, in particular, is an emotion that can also lead to high sympathetic activation, which in turn can inhibit parasympathetic activity and drive the heart rate to a high level. Together, these responses result in low HRV.

It can be seen that the ECG spectra in this state appear quite different from those in the Incoherence mode, in that they exhibit a series of high-amplitude standing waves that persist from one epoch to the next in the series. This pattern emerges because the interbeat intervals in the ECG have become uniform (low HRV). The spacing between the peaks in the ECG spectrum is a reflection of the time interval between heartbeats. Higher heart rates (short interbeat interval) produce an ECG spectrum in which the peaks in the harmonic series will be further apart. This can be seen by comparing the ECG spectra for the Emotional Quiescence mode (Figure 33) to those for the Extreme Negative Emotion mode (Figure 30). In Emotional Quiescence, the heart rate is much lower than in intense anger. This means that the time interval between each consecutive beat is much greater, and therefore the peaks in the ECG spectra are much closer together than those observed for intense anger. In both the Emotional Quiescence and Extreme Negative Emotion modes, a strong, consistent pattern of standing waves is produced in the electromagnetic field radiated by the heart. This pattern is indicative of a highly coherent order.

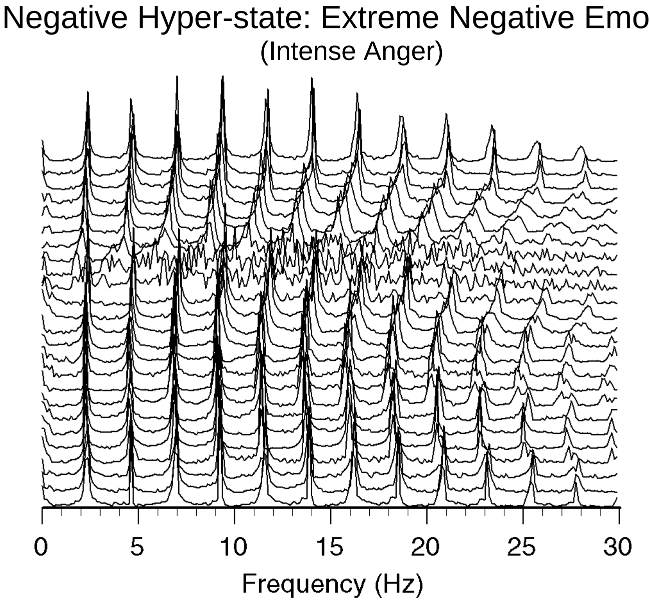

Figure 30. Waterfall plot of ECG spectra for the Extreme Negative Emotion mode. The standing wave pattern is due to the very low HRV in this mode (see text for discussion).

Relaxation

Figure 31 shows the ECG spectra for the Relaxation mode. The spectra for this mode display some similarity to those for the Mental Focus and Coherence modes, in that they have in common the two sets of peaks in the ranges of 3–5 Hz and 7–8 Hz, which are observed in most of the individual spectra. This characteristic is due to the presence of the low frequency rhythm in the HRV. However, in the Relaxation Mode, these peaks are higher in amplitude than those for Mental Focus. This is because the low frequency rhythm is more prominent in Relaxation than it is in Mental Focus, as is evident in the HRV power spectra in Figure 8. Moreover, the spectra manifest a greater density of variability, and hence complexity, while still organized as a coherent structure. The greater complexity is the result of greater high frequency variability in the heart rhythm pattern, which is also apparent in the associated HRV power spectrum (Figure 8).

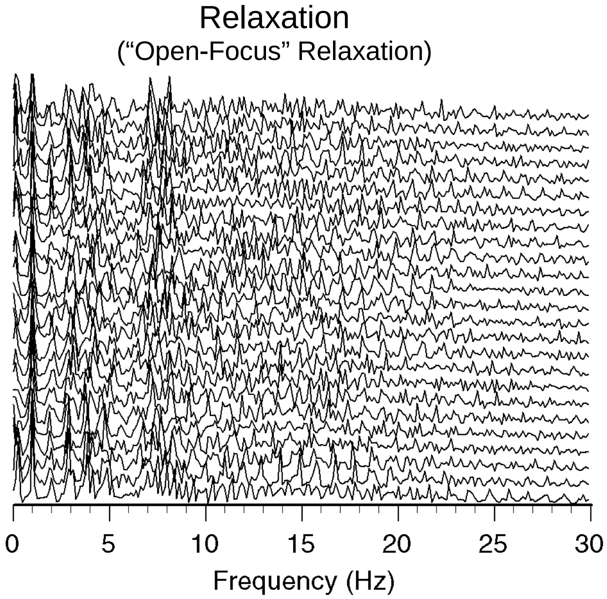

Figure 31. Waterfall plot of ECG spectra for the Relaxation mode. These spectra maintain a coherent structure and rich complexity.

Psychophysiological Coherence

Figure 32 shows the ECG spectra for an individual's experience of "appreciation," used to illustrate the Psychophysiological Coherence mode. A strong, consistent pattern of standing waves can be seen in the two sets of peaks occurring in the 3–5 Hz and 7–8 Hz ranges. This is due to the prominence of the low frequency rhythm in the HRV. Even though there is also a high density of variability (complexity) in the pattern of standing waves, a coherent order persists across the individual spectra. A complex yet coherent order of energy movement is optimal for encoding information as a signal. Conversely, when the rhythm of energy has little variability, there is less potential for the encoding of information. Thus, the electromagnetic field generated by the heart in the Coherence mode appears well suited for effective information communication. By comparison, the electromagnetic fields of the other modes display less variability and complexity and therefore do not have the same potential—the "requisite variety"—for information encoding and transmission (Ashby, 1956).

It is apparent that the ECG spectrum alone does not provide an adequate means to clearly differentiate the Coherence, Relaxation, and Mental Focus modes, as their ECG spectra all have a similar appearance. However, as shown earlier, these three modes are clearly differentiated by their heart rhythm pattern (HRV). For this reason, the heart rhythm pattern and HRV power spectrum are generally used as the major identifiers of the psychophysiological modes.

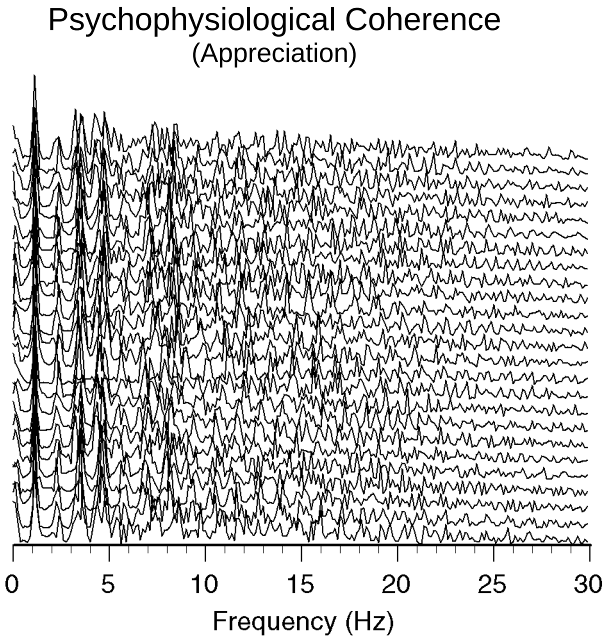

Figure 32. Waterfall plot of ECG spectra for the Psychophysiological Coherence mode. These spectra display a rich complexity and high amplitude, yet retain a coherent structure from spectrum to spectrum.

Emotional Quiescence

Figure 33 shows the ECG spectra for the Emotional Quiescence mode. As discussed earlier, Emotional Quiescence is a peaceful, heart-focused psychophysiological state signified by unusually low HRV. Its ECG spectral profile has a pronounced standing wave-like pattern that, as a harmonic series, is relatively uniform in that it is consistent from epoch to epoch. This persisting "standing wave" pattern in the spectrum of the ECG indicates that the heart is generating a highly coherent electromagnetic field in this mode. Based on subjective reports of this mode, it would appear that the organization of this electromagnetic field reflects a psychophysiological order that is highly conducive to states of peace and serenity and also receptive to experiences of spiritual connectedness.

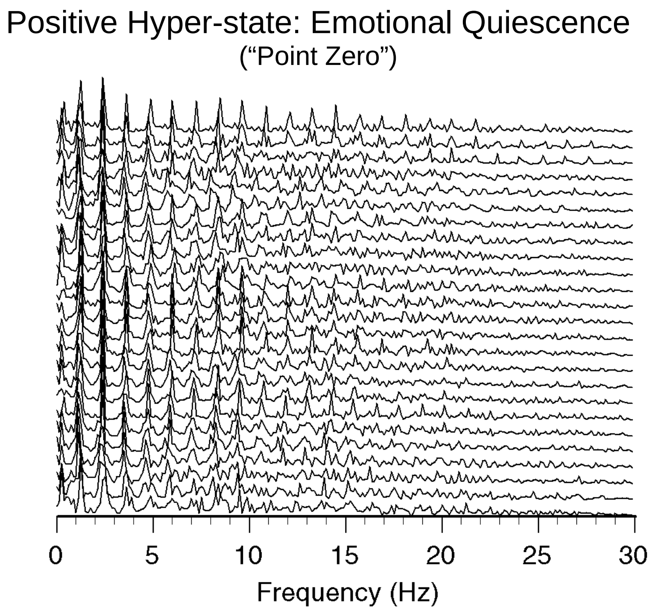

Figure 33. Waterfall plot of ECG spectra for the Emotional Quiescence mode. The coherent structure of standing waves that is constant from spectrum to spectrum is due to the very low HRV in this mode.

The Ethics of Promoting and Assigning Adult Developmental Exercises: A Critical Analysis of the Immunity to Change Process

Sofia Kjellström

Abstract: The *Immunity to Change* (ITC) process devised by Robert Kegan and Lisa Laskow Lahey is promoted as an influential technique for creating individual and organizational change. A critical analysis of the ITC process applied in university settings and organizational contexts show that an unintended result is the unwillingness and inability of some participants to participate adequately. Significant theoretical and ethical implications arise in the interplay between three interrelated variables (a) the role and competence of the facilitator, (b) expectations and capabilities of the participants, and (c) the mental demands and assumptions of the process. The inquiry illustrate that the ITC process is probably built upon an implicit assumption that change into greater mental complexity is always good and right, and its inherent structure creates demands that can put participants "in over their heads." The main conclusion is that developmentally-aware, ethical approaches to using transformational practices such as the ITC should meet at least three demands: they should be conducted as voluntary activities on the part of well-informed participants, they should integrate an adult developmental perspective into the process itself, and they should openly allow the possibility that it is the organizations that may also need to change.

Keywords*:* adult development, ethics, organizational change, teaching.

Introduction

How are we to use exercises meant to promote developmental change in an ethically proper way? Adult development advocates are eager to promulgate the practice of transformational change curricula into more complex ways of meaning making; however, rather than uncritically incorporating these techniques into a variety of settings, it is important to consider the hidden assumptions and ethical implications of these techniques. Such examination has the potential of improving the quality and usefulness of techniques within the adult development field (Ross, 2008; Stein & Heikkinen, 2009)

Higher education is one arena easily available for promoting and encouraging adult development of mental complexity. Certainly, if we want education to be informed by adult developmental theory, we must do more than teach theories of adult development as part of course content. Curricula that actually support the development of mental and emotional complexity are necessary (Baxter Magolda, 1992, 1999; Baxter Magolda, 2000, 2001; Hoare, 2006; Kegan et al., 2001; King & Baxter Magolda, 2004; King & Kitchener, 1994; Marchand, 2008; Stevens-Long & Barner, 2006). One way of accomplishing this goal is to incorporate transformational exercises like the *Immunity to Change* (ITC) to class activities. The ITC process devised by Robert Kegan and Lisa Laskow Lahey is promoted as an influential technique for

SOME RIGHTS RESERVED

creating individual and organizational change, but my experiences in utilizing the ITC process are more mixed than the usually enthusiastic responses expressed by for example Jonathan Reams (2009) and Kegan and Laskow Lahey (2009).

The field of fostering adult development includes several methodologies within different domains of life and with different target groups, for example transformative and emancipatory learning, working with moral dilemmas in education, individual and one-on-one efforts, and action inquiry in small groups (Ross, 2006). The ITC process can be seen as an example of a method aimed at promoting development and has been described in several formats: books (Kegan & Laskow Lahey, 2001a, 2009), scientific journals (Bowe, Lahey, Armstrong, & Kegan, 2003; Bowe, Lahey, Kegan, & Armstrong, 2003; Kegan & Laskow Lahey, 2001b), book reviews (Reams, 2009), interviews (Sparks, 2002), and periodicals (Business Digest, 2009). All accounts emphasize the efficacy of this approach, and few negative aspects have been brought to light. I have found no studies that address inadequacies or tests of effectiveness. The texts are written by the originators or people who have used and found the process valuable. I have found no studies that describe the use of the ITC in an educational setting with students.

The purpose of this article is to critically analyze implications of putting the ITC process into practice in educational settings and organizational contexts, the ethics of doing so, and key assumptions that underlie the procedure. This article uses a three-part presentation that includes the basic structure of the ITC process, an example of how it was incorporated in higher education, and the results of that experience. This background sets the stage for a critical examination of the role of the teacher or facilitator, ethical implications of participants' abilities and reactions, and underlying mental demands and assumptions. Desired outcomes of the process are also discussed. Ethical considerations and how assumptions of adult development shape the process are at the heart of the concerns discussed in this article. Specific difficulties of using the ITC in an educational setting are the starting point, but the analysis expands to encompass implications for other situations, for example working life, and universal inquires and objections.

The ITC Process in Practice

The Methodology of the ITC Process

The method was initially created to facilitate individual and organizational change in corporate settings (Kegan & Laskow Lahey, 2001a). The methodology addresses two questions: why changing human behavior is so difficult, and why achieving desired behavioral changes does not happen as often as we would prefer. The method provides a tool to overcome these concerns by identification of a personal immune-system that works to inhibit certain behaviors and/or the fulfillment of certain values. It is based upon the assumption that real change is not a matter of learning new skills. Rather, it requires changes in the level of mental complexity. The goals or possible outcomes of the ICT are "personal and professional well-being" (Bowe, Lahey, Armstrong et al., 2003, p. 716), more effective organizations, and development of mental complexity.

The ITC process can be seen as an application of the constructive-developmental theory by Robert Kegan (1982, 1994). Kegan proposes three adult meaning systems that make sense of the world in qualitatively different ways: socialized mind, self authoring mind, and self-transforming mind. Persons having a socialized mind are strongly influenced by views and expectations of others, which affects how they think, feel and act. With a self-authoring mind, persons have the ability to have one's own view independent of others' expectations since they are able to coordinate other beliefs with their own convictions; they also have the capability to examine thoughts and feelings. For persons with self-transforming meaning-making, one's sense of self is not tied to particular identities and they can look through their own agenda.

The first version of ITC process was described in the book *How the way we talk can change the way we work: seven languages for transformation* by Robert Kegan and Lisa Laskow Lahey, which was followed by popularized and shorter descriptions (Bowe, Lahey, Armstrong et al., 2003; Kegan & Laskow Lahey, 2001b) until the most recent book *Immunity to Change: How to overcome it and unlock the potential in yourself and your organization* appeared. The basic structure of the technique is the same, but the labels, instructions, framing and number of steps have varied (see Table 1). In this article I will refer to the first book and related articles as ITC 1, the new book as ITC 2, and ITC for general statements about the process.

Table 1. Descriptions of the ITC process

	Part 1				**Part 2**
	'The Table'				**'The Test'**
	Commitment	**Doing/not doing instead**	**Hidden competing commitment**	**Big assumptions**	**Reflection and test**
(Kegan & Laskow Lahey, 2001a)	Language of commitment	Language of personal responsibility	Language of competing commitment	Language of big assumption. Identifying assumption	Language of big assumption. 4 steps
(Kegan & Laskow Lahey, 2001b)	Stage 1			Stage 2	Stage 3, 5 steps
(Bowe, Lahey, Armstrong et al., 2003)	Step 1	Step 2	Step 3	Step 4	Step 5, unclear includes test
(Kegan & Laskow Lahey, 2009)	Diagnosing ITC				Overcoming the ITC
(Kegan & Laskow Lahey, 2009)	Commitment (improvement goal)	Doing/not doing instead	Hidden competing commitment	Big assumptions	Three phases, including 9 exercises

The ITC process has two parts. The first aims at uncovering the commitments to change and diagnosing the person's immunity to change, and the second is a series of exercises designed to create change in behaviors. The first part consists in four steps which are presented in a table of four columns (see Table 1), where the table is used to structure the process and provide an overview. The work described in the first column is to identify personal commitment, which is done through answering the question: What sort of experiences would be more supportive of your development at work? The formulation of the initial question varies in the different versions. The answer is then examined to identify underlying values and reformulated into a personal commitment. In the second column, behaviors are enumerated – both actions and omissions – that interfere with the commitment.

The task of the third column is to identify a competing commitment. Participants are prompted to reflect on fears or anxieties that arise if the identified actions, in column two, are not performed. The passive worries are then transformed into an active statement, which becomes the competing commitment. This serves as a new explanation of why certain behaviors are not performed, since persons hold values that are in contradiction to and in competition with the other. What was previously viewed as obstructive behaviors is now seen as supportive actions of the competing commitment, but nevertheless preventing people from achieving their primary goals. A first picture of the “immunity system” is revealed which is called the immunity map or X-ray since it is “a picture of the invisible made visible” (Kegan & Laskow Lahey, 2009, p, 32). Modifying the immune system requires that we identify the underlying hidden assumption on which the competing commitment rests (see column four, Table 1). This assumption is called the ‘big assumption’: it is the internal truth that a person creates to sustain his or her immunity to change; identifying it is a difficult process (Kegan & Laskow Lahey, 2001b).

The purpose of the second part of the process is to question and test the validity of the big assumption and thereby overcome the person’s immunity to change, a goal that is realized through several experimental self-reflective exercises including a test. In ITC 1 the second part is described as consisting of four or five exercises, observing and recording current behavior, looking for contrary experiences, exploring the history, and designing, running, and evaluating a test. ITC 2 includes a set of nine exercises in three phases, including all those previously mentioned plus additional ones, for example a pre/post survey to get external input from colleagues and family on your improvement goal, and to reflect on how the learning can be consolidated in the future.

The general structure of ITC 1 and ITC 2 are essentially the same, but in the ITC 2 there are substantial elaborations in the description of the methodology for participants and added check-lists and surveys to support and extend the process. Other changes are that the initial question is more value neutral, a greater emphasis is placed on finding a ”good” improvement goal and first commitment as a starting point, and the importance of involving family members and co-workers in the process is emphasized.

The Use of the ITC 1 Process in Higher Education

The theoretical work of Robert Kegan is central in the area of adult development (Kegan, 1982, 1994; Kjellström, 2005), and the ITC exercise was incorporated in my university teaching with students (Master and Ph.D. level) and healthcare professionals (mainly nurses and assistant nurses). I used Kegan’s theory in my Ph.D. thesis, and my research position at a university has facilitated deeper studies and use of several adult development methods and theories in research.

Additional writings on the topic proved useful to increase my knowledge of how to facilitate the process, (Bowe, Lahey, Armstrong et al., 2003; Bowe, Lahey, Kegan et al., 2003; Kegan & Laskow Lahey, 2001b; Sparks, 2002). This exercise became part of courses on ethics and professional development on seven occasions, with more than 100 participants. The ITC 1 process was employed in accordance with the recommendations of Kegan and Laskow Lahey, with only some modifications in order to suit the delivery formats in the educational setting. Namely the initial question used to form the first commitment was reformulated to suit students who were not simultaneously working professionals. The process was divided into two parts. The first part asked participants to fill in four columns in a table (see Table 1 & 2), allowing their immunity to change to be identified. The second part was composed of five self-reflection tasks, including a test to perform and evaluate.

Two delivery formats were used with different students groups: meeting in class or interaction through a web platform. I always emphasized that they should not disclose more than they felt comfortable sharing. During a lecture or workshop lasting two hours, students were led through the process of filling in the table and were then encouraged to reflect on their responses and create a test. The filled-in table and written report on the self-reflection tasks were sent to me and discussed verbally in small groups led by me. No written text was shared among the participants, and participants were given the choice of whether they wanted to tell others about their commitments and test results.

In the web-based course the students (health professionals) read an article (Kegan & Laskow Lahey, 2001b), listened to a lecture, and read a sixteen-page Swedish document (created by me because my participants were not used to reading English) that explained all the steps. (Kjellström, 2006). After filling in all columns, they sent their tables to me and to an online discussion forum with four to five participants, where all students saw what others in their group had written. This sharing is an example of moving private or personal assessments into a public sphere. I commented and helped them with the table to ensure participants had an adequate starting point for the next part, which consisted of five tasks. They performed and reported the assignments one by one to the small online discussion group. Subsequently, group participants read and commented on each other's work, because observing others' experiences could provide a valuable learning experience. The reports on each of the five tasks were always read and sometimes commented on by me. The tables were sent to me initially and further distributed if the person consented. The incorporation of group discussions was done to give participants an opportunity to share experiences, and ponder similarities and differences. This is not something that Kegan and Laskow Lahey describe in their first work, but they put an emphasis on the importance of sharing experiences because it illustrates that things that often are considered merely personal are also general for others (Kegan & Laskow Lahey, 2001a).

Results from Doing the ICT 1 Process in the Educational Setting

On the one hand my experiences can be described as a "success." The instructions of the ITC 1 process by Kegan and Laskow Lahey helped me create a learning situation that seemed to work quite well for a majority of the participants. Some students reportedly regarded it as a profound experience that they wanted to continue to use and spread to others. On the other hand, I also had experiences with participants feeling less comfortable in the situation, which could be interpreted as "failures." This section will mainly be concerned with what went amiss, because it is the examination of these experiences that builds a foundation for further discussion and a critical analysis of the various factors that might have produced these outcomes and the ethical issues they raise. The two prominent results elaborated here are that persons did not complete required parts of the ITC 1 process, and a few did not want to participate, and therefore refused to do it.

Problems with the first part of the process are that some people had difficulty putting content into the columns. The most common problem was an inability to articulate a personal fear or worry that could be turned into a counter commitment, but it was also problematic to identify the big assumption and to present actions that inhibit the primary commitment. Even after several occasions of written feedback by email or personal communications, a few individuals produced a barely acceptable table as a starting point for the test and self-reflection exercises.

Other difficulties arose in the second part involving the self-reflective tasks. The tests run by my students often tested third column commitments rather than fourth column "big assumptions." Regardless, a test of the counter commitments seemed adequate for the exercise to be performed. An examination of the 67 tables filled in by health care personnel shows that one of the most common topics was fear of calling attention to someone who is doing something wrong, often because being liked by everyone else is so important to them. When they ran a test where they actually expressed these opinions, they realized for the most part that nothing bad follows such actions, and that raising their voices was generally appreciated. This experience was both powerful and empowering for nearly everyone who ran this kind of test. But an important limitation was that to my knowledge there were no or few generalizations made to other domains of life, which might reduce some of the transformational power of the exercise. Another problem was that when asked to reflect on their own behaviors some people only described actions or reactions of others.

Some people were unable to do part of the exercise as I provided it with its limitations regarding support or assistance, and some students refused to do certain parts, for example, reflect on childhood experiences, provide a personal experience, admit vulnerability, or talk in a follow up group discussion. On one occasion several students objected and had negative feelings about the exercise because it was perceived as being too personal, and the students expressed the idea that it felt very weird to run tests "on" their classmates, which resulted in a discontinuation of the ITC 1 as an obligatory assignment.

Critical Reflections on the ITC Process

The criticism below starts with a focus on the potential impact of two variables that need to be considered: the capacities of the leader or process facilitator and those of the participants. Possible desirable outcomes are discussed and a complementary solution of adapting societal structures to the mental demands of people is proposed. Finally the analysis is concerned with the mental demands in and assumptions of the ITC process, which can play an important part in how the process is utilized. The critical examination of the ITC process is not limited to the first version, because the general structure is essentially the same in all present versions.

Facilitator’s Choices and Capacities

This section provides examples of how I handled different situations in order to illustrate more general implications of the role of the facilitator and teacher. I acknowledge that some of the failures are probably due to my way of implementing the process, for example the way I framed and explained the process to the participants. The incident when several students questioned the process accentuates the need to firmly establish the exercise in the work group, a task I probably failed on that occasion since they did not sense a trusting environment. Kegan and Lahey emphasize that a leader needs to be an active advocate of the process by setting a good example and promoting a commitment to positive change work; simply authorizing the exercise is not sufficient (Kegan & Laskow Lahey, 2009, p. 81). In education and classes the teacher is the leader and authority, and needs to establish trust and authority. How a teacher with constraints in his/her role and setting can do this differs from how a process facilitator in another setting can do this: trust is not always consistent with the teaching role—the teacher is often not a confidant whereas a process facilitator may be.

When people were not able to fill in the table or resisted parts of the process I handled this by backing off. For example if the columns were not filled in as required for a perfect starting point, and the feedback had yielded an acceptable table, I viewed this as sufficient, without further judgment or comment. When people did not want to do part of the exercise their wishes were always accepted, and no one was ever forced to participate in any stage. This management was inspired by an ethical consideration, for example inspiration from Kegan and Lahey’s ground rules that it is up to the people participating to decide how much they want to share (Kegan & Laskow Lahey, 2001a). Later reflection led me to realize that I had not shared sufficiently with my students my motivations for administering this exercise and my hopes for their beneficial experiences. Transparency about reasons for using the exercise as part of introducing it may have helped both students and me by providing space to discuss successes and failures on individual and group level.

My personal assumption at that time was that personal development in qualitative phases is a positive factor that needs to be promoted. Using Kegan’s theory (1982, 1994) to interpret my own orientation toward fostering adult development, I see that it was “subject” in my mind (in Kegan’s terms), which means that it was a perspective through which I unknowingly looked at the world. To have a goal of fostering adult development as a subject may cause an overemphasis on the intervention’s positive aspects and neglect of its possible side effects. Only when I (or others, presumably) distance myself from attachment to the idea of fostering adult development and take it as an “object,” as if being an outsider to the adult development perspective, does the critique put forward in this article become possible. That is the shift I made in order to produce this critique.

In the current educational system the time and competence of teachers is also an important issue to discuss. The most recent version (ITC 2) demands that teachers spend more time doing the first part (Kegan & Laskow Lahey, 2009). The first edition suggested a timeframe of 2-4 hours, to identify the immunity system, but the more recent version includes several examples that expanded the timeframe to two days. Given how classes are scheduled within the educational system, the time with a teacher in class is limited. The question is whether teachers have enough time, but also whether the time they do have is best put to this task or to other tasks, i.e., is this exercise the ‘best’ use of class time? In addition, do teachers have sufficient psychological training to support the students adequately?

For a teacher to assign any task is an exercise of power. Kegan and Laskow Lahey talk about the need to deliberately create an optimal conflict, which is portrayed the following way:

- The *persistent* experience of some frustration, dilemma, life puzzle, quandary, or personal problem that is…
- Perfectly designed to cause us to *feel the limits* of our current way of knowing…
- In some sphere of our living that we *care about*, with…
- *Sufficient supports* so that we are neither overwhelmed by the conflict nor able to escape or diffuse it. (Kegan & Laskow Lahey, 2009, p. 54)

But what right does a teacher to create optimal conflicts in peoples’ lives? Most people have pressures in all domains of life. Is it good to create another conflict even if the intention is to resolve it in the long run? The answer is not evidently affirmative because there are interventions that promote development without being designed to be structurally disequilibrating (Manners, Durkin, & Nesdale, 2004, p. 21).

One assumption of the methodology is that moving things from the private to public sphere will facilitate a successful process. This is a kind of support group process, but again, people self-select into support groups for the purpose of hearing and listening — there is transparency about what goes on there and strict norms of behaviour. A key aspect of my argument is that in educational settings, the self-selection into classes is for purposes other than personal self development. It is impossible to exert the same kind of normative structure around privacy, since discussing assignments, topics, lectures, homework, and the like is a routine part of the learning process for students in these settings.

Kegan and Laskow Lahey claim that too much adult learning occurs in classes separated from the workplace, and that it is more powerful to teach people in their workplaces together with their colleagues rather than enroll them in individual courses (Kegan & Laskow Lahey, 2009). Although providing learning experiences for adults in the workplace can be beneficial for certain types of material, using the workplace (and the workgroup) as the location for this kind of an exercise also raises concerns. Workers may feel particularly constrained in these settings, believing that their performance on the exercise will influence their employment and/or their professional relationships with their coworkers. One could argue that this limitation can be overcome when the facilitator lays the foundation for trust and safety, but a counterargument similar to the one offered for educational institutions must still be considered: does the organizational environment create an implicit coercion for workers to comply?

Participants’ Choices and Capacities

Several of my students were very perplexed when asked to work on emotional aspects of themselves, finding the task very difficult. They were not used to admitting and articulating emotions or publicly expressing negative aspects about themselves. Education is currently organized to emphasize cognitive knowledge (Stevens-Long & Barner, 2006), and students do not expect to reveal their emotions or be asked to integrate their self concepts into knowledge construction. The recent book stresses that participants need to be more dedicated to working with an issue that is meaningful to them and to leave behind their immunity to change toward it (Kegan & Laskow Lahey, 2009), but how much commitment can we expect or require from students or employees in a hierarchical structure and culture? As an example, the ITC was used to increase the sales of a pharmaceutical company, but as Abigail Jenikins says in an interview "as it required a significant level of commitment to both personal and group change – while still in the pressure-cooker environment – five team members inevitably left along the way" (Business Digest, 2009, pp. 8-9). This ITC work was facilitated by very competent consultants Lisa Laskow and her colleague Bob Goodman. Noteworthy is the fact that, even with professional facilitators, situations occur where five out of ten participants drop out. Kegan and Laskow Lahey openheartedly admit that 30-40% of the participants did not have a powerful experience with the exercise as it was formulated in the 2001 version (Kegan & Laskow Lahey, 2009), but since the basic structure is the same in the new version, ethical issues undoubtedly remain.

Although a few of my students provided reasons for their decisions of non-participation, e.g., that personal experiences were no one else's business or that they were involved in concurrent cognitive behavioral therapy, other students may have been uncomfortable with the exercise, but did not voice their objections. This possibility concerns me, both because of the hierarchical nature of the student-professor relationship and because voicing concerns about another person's actions was one of the behaviors with which people had the most difficulty.

The result of my experience of putting the ITC process in practice leads me to question if all people are willing to do the exercise. Even Kegan and Laskow Lahey give a negative answer to this question. To answer whether all participants are willing to participate in self-reflective practices they state:

> Almost none of them had any clue when they began the process of developing their X-rays that they were going to create a picture that would be so revealing – or intriguing – to them. If we had told them beforehand what they were going to produce, some might have declined to participate, and most might have been skeptical. (Kegan & Laskow Lahey, 2009, pp. 46-47)

The quote appears in a section where the authors explain that the people they have coached are not unusual, they are all able to reflect when expected to participate in an ITC process. To me this quote illustrates some legitimate bases for objections. The ethical question is whether it is right to assign tasks that people might have refused to perform had they been adequately informed at the beginning. As researchers we are supposed to involve participants in an informed consent process where the participant is given adequate information and we make sure that true consent is given. Should our students not be treated with equal respect and ethics? A possible objection is that we as authorities have the power to assign tasks in the best interest of the students. But then the questions reappear in a new way: do we know that the exercise is in the best interest of the student? One answer is that to increase the future autonomy of a person, we must sometimes exercise authority that overrides the present autonomy in a pre-intervention information process (Beauchamp & Childress, 2009). For example, in order to increase a person's ability to make better choices in life, information is needed. If the information is provided against the will of people, then their right to decide to access that information is currently overruled. The ethical justification for this paternalistic behavior is that the autonomy will be increased in the long run and produce a greater good. The problem is that this solution does not see or solve the challenge that providing the information changes the situation for every individual that is exposed to the new information. By its nature, information places a demand on people to do something with it.

A more intriguing question is whether all students and adults are able to participate in these kinds of practices. Kegan and Laskow Lahey state that the people involved in their sessions are not unusual people; instead, they report that their participants are "every kind of person you can imagine," but then admit that participants are primarily college educated middle class people from all over the world (Kegan & Laskow Lahey, 2009, p. 45). In other words, they are part of professions that can afford to pay for consultants and do not for the most part include working class people. My interpretation is that their reports are not based on people who are (on average) at an earlier stage of development, since they have not worked with people at plain jobs which require less complexity in reasoning (Commons, 2007). In defense of Kegan and Laskow Lahey, they give two examples where they specify the level of development, one with a socialized mind and one with a self-authoring mind according to Kegan's classification (Kegan, 2003; Kegan & Laskow Lahey, 2009). But they do not comment on those 3-13% percent of people who have developed less complexity than the socialized mind (Kegan & Laskow Lahey, 2009). What are the implications if not all participants are able to do the transformational training? Some people may have reached developmental limits due to factors like genetics and psychological damage earlier in life or cultural limitations (Commons, 2008). Individual development is affected by many influences: evolutionary, ecological, genetic, neural and hormonal, biomedical, nutritional, phenotypic, proximal and distal environmental influences that are all necessary but not sufficient to analyze a person, and it is a hard task to disentangle, predict and thus account for all influences (Wachs, 2000).

What's the Desired Outcome? Changing People or Organizations?

When the ITC process is used it is important to consider the desired outcomes. Is people's work with trying to dissolve their immunity to change a mutually agreed on desirable procedure? Does doing so serve the interest of the individual or the organization or both? In the ITC 2, the authors have expanded the exercise from an individual tool to an organizational device: "... the purpose of our work, however we went about it, was to grow the organization's ability to better deliver on its aspirations" (Kegan & Laskow Lahey, 2009, p. 82). This could make the process more powerful (Kegan & Laskow Lahey, 2009), but it could also increase the potential for two kinds of misuse. First, there is no inherent ethics built into the process, which means that it could be used to improve teamwork and thereby increase productivity for a company that destroys the environment. One solution of this is to make an ethical assessment before making the ITC available to a client company. Secondly, workers may be treated as means to a "greater" goal of increased productivity. There is quite a difference for people between signing up for self-improvement workshops in their spare time, and to be assigned to do something like the ITC because the employer decided that all workers need to improve their performance. One might even go as far as questioning if this is “adult development” or manipulation? Is participation in the ICT process empowering or does it make participants more malleable with increasing their self doubt? In summary, many ethical questions are worth investigating in general and in process design.

Developmentally-aware leadership means that leaders need to be more patient and understand that change takes time (Kegan & Laskow Lahey, 2009). This knowledge could be applied in all domains in life, and maybe there are better ways to be patient with co-workers, peers, students, and family. A complementary solution to the increasing mental demand of modern life, which seems to be invisible for some, is to adapt the workplace to people instead of changing people to adapt to workplace. Great parts of working life today require what Kegan calls a self-authoring way of meaning making in many cases (Kegan, 1994; Kegan & Laskow Lahey, 2009). This could be interpreted to mean there is a challenge to raise individuals to this level. Another way to consider this challenge is to ask the question: How can educational settings and workplaces change so that they make room for all kinds of people at the socialized order, the self-authoring order and the self-transforming order? The fact that organizations and companies require employees of higher levels of complexity (Kegan, 2004) is a challenging issue, because the costs are probably both individual and societal. And I do not think the solution of encouraging people to change and “develop” is either possible or an ethically-sound solution for all situations, because it will create expectations that are too challenging and over the heads for some.

I propose an analogy to support my points. If we have two ends in our hands, and we cannot make them meet, we can assume one is fixed and pull hard on the other or we can assume both are movable and try to bring them closer by pulling on both, or we can find a third piece that spans the gap between the two. If there is some problem in, for example, how workers “fit” into workplace organizations, and there is assumed to be only one solution, then it is possible to say that the organization refused to show flexibility (or growth or development) along the lines required by the workers. If a worker is not completing the piecework that flows along the assembly line, is it the “fault” of the worker, the “fault” of the assembly line organization of work process, the “fault” of the speed of the assembly line, or the “fault” of the employer who has assigned one worker so many tasks? Or does it indicate that there seem to be multivariate conditions that can account for a given situation, and how one sees it depends on one’s perspective. One motivating perspective is that employers want employees who can do certain things at given levels of complexity. Certainly one might hope that all people can develop to their full potential, but *that* that potential differs among people for numerous reasons needs to be considered (Commons, 2008).

The Mental Demands in and Assumptions of the ITC Process

The ITC is built on the key assumption (that I also share), that people do grow as adults, and even if it is often a slow process it is possible to further this development by adaptive and transformative exercises. The assertion is also that the ITC exercise actually can help people grow into new orders of complexity (Kegan & Laskow Lahey, 2009), but to what extent the ITC promotes transformation in orders of complexity is not yet clear. The primary follow up described by Kegan and Laskow Lahey is that people in organizations perceive themselves and others to be doing “better” on particular issues when they have used the process (Kegan &

Laskow Lahey, 2009). Kegan and Laskow Lahey do not provide results from any longitudinal studies that track changes over time to document the effectiveness of the method, and neither did I study that with my students.

A meta-review of 36 studies and over 12,000 participants showed that for a majority the developmental level stabilizes by early adulthood (Cohn, 1998). Individual development occurs, but little is known about it because most research has been performed on group data. A few studies have addressed the issue of promoting development among adults, and the results are mixed. Interventions to increase the ability to adopt a social perspective have been successful for children and adolescents, but in two studies “adults did not mature in response to role taking experiences or training experiences designed to increase one’s perspective taking and coping with inner conflict” (Cohn, 1998, p. 41). A few studies have succeeded in promoting development, but particularly few to postformal stages of development (Manners et al., 2004; Pfaffenberger, 2005; Ross, 2006; Torbert, 1994; Torbert & Fisher, 1992). According to Torbert, success factors for practices being developmentally effective are the following.

> (a) Voluntary engagement, (b) endurance over years, (c) guidance for participants by individuals who measure at later action-logics, and (d) research/ learning that integrates inquiry and action in the present moment (Torbert, personal communication in Ross, 2006, p. 41)

The ITC process does not live up to all these criteria. This does not preclude the possibility that for certain individuals the exercise will occur at just the right time to be a trigger for a transformational change. If the effectiveness of the process is going to be established, further research into its efficacy would need to be conducted. This, I recommend.

The Mental Demand of the Exercise

To be more specific, and to paraphrase Kegan himself, what are the mental demands of the ITC process (Kegan, 1994)? The ITC exercise consists of two parts, which puts different demands on people. Filling in the table requires a certain level of reflectivity about oneself and one’s actions; in addition, the participant must be able and willing to admit unfavorable aspects of oneself. The exercise is built on the requirement that all participants are able to use, at minimum, formal stage thinking. For example, it is not enough to blame others and make broad generalizations about others or self. To put items in the table requires at least formal stage reasoning because the persons need to see themselves responsible for the commitment (Kegan & Laskow Lahey, 2001a). An adequate understanding of personal responsibility is a formal stage concept which requires formal stage reasoning (Dawson & Gabrielian, 2003; Kjellström & Ross, 2009). In addition, it also requires the ability to present an antithesis of the argument when the counter commitment is identified. In summary, to do the ITC table of four columns requires systematic stage capacity to put formal relationships together coherently (Ross, personal communication, Nov. 30, 2009). In addition, it requires people to be able to reflect upon their emotions and have them as an object, in Kegan’s terms. The second part demands that participants observe their behaviors and interactions with others, which presupposes individuals have abilities to look at themselves from the perspective of another person.

An ITC Process on the ITC Process

What would happen if we performed the process on the process (see Table 2)? Multiple commitments are possible in a situation simultaneously, which means that others might come up with different first commitments, but this is my proposal. Thus, the objective of this thought experiment is to surface a possible underlying assumption of the process: in other words, on what sort of internally-presumed truth the process may rest on. As a starting point, we have to state a premise that there is an imaginary self (let us just call it “the ITC-itself”) that could be seen as the subject (in place of a typical person-participant); it represents the ITC performing its own process on itself. For the first step, the ITC-itself’s first commitment could be that positive adult development should be promoted because it is possible. In the second step, ITC-itself experiences that what interferes with this commitment’s goal are that people do not always change. In addition there is Kegan’s explicit commitment that increased mental complexity is necessary for people to adapt successfully to the environment, else they are “in over their heads.” The ITC-itself may assume that its design or explanations are inadequate to get intended results. In the third step, the ITC-itself identifies that its actions that undermine its first commitment (above) are using its steps with people that cannot or will not perform and use them. In reaction to that assessment, the counter commitment may be to not show or admit weakness in the ITC process because then the ITC-itself could no longer believe in its own effectiveness. A second possibility is that the ITC-itself would not admit the possibility that there will be those who simply do not change by using the ITC. That would challenge the primary assumption that people *can* develop by using the ITC.

Table 2. The ITC process on the ITC process

Commitment	Doing/not doing instead	Hidden competing commitment	Big assumptions
Adult development should be promoted.	To design or explanation the ITC in a inadequate way	To not show or admit weak-nesses in the ITC process; To ignore those who do not change	Change to more mental complexity is always right and good.

My suggestion is that the ITC process is based upon the “big assumption” that change of mental complexity is always right and good. But this assumption is not “taken as an object” and discussed by its authors. Authors of the books express an awareness that sometimes people do not change. This “failure” to change is explained by recognizing that change is difficult, that it is a slow process, that it takes personal motivation, integration of thought and emotions, connection between mind and hand, and a supportive social context (Kegan & Laskow Lahey, 2009). However, the normative notions that change in complexity is good or the possibility that conditions may exist when it is not a good fit are surprisingly not considered or challenged.

The second part of the ITC process is to modify and test the major assumption. Doing so would, for example, include finding cases when it is not in the best interest of people to change. Persons in this category could be those who are on the first phase of a next level of development and in the process of translating their experiences, or people who are stuck in their current way of living and do not have the abilities and support as described above. An alternative assumption would be that some people also have reached the limits of their individual means of growing meaning-making systems of higher complexity. This could mean that using the ITC process in a setting with such individuals will put further pressure on those individuals, possibly creating even more barriers to the possibility of a harmonious life. If this is the case and an underlying but now conscious assumption, we have a basis for considering the previous comments regarding ethics and the need to adapt workplaces and social structures to people's different ways of meaning making.

If my proposal of the ITC's "big assumption" is regarded as a compelling interpretation, and the implicit and invisible "big assumption" behind the ITC is spelled out and replaced by a conscious assumption of change being *sometimes* beneficial and possible, then the ethical road forward is to build this into the ITC process. Inspiration might come from the TIP process (Ross, 2006), which is constructed with the conscious underlying assumption that there are both people who benefit from change and those who do not.

Conclusion

The ITC process seems to be constructed on a major implicit assumption of change as always beneficial to all people. This is highly questionable, but regardless of the proof of its validity, several ethical questions remain that are not easily answered: Should students be required to go through this process? Should employees in a given workplace be required to do this? Should they be able to refuse to participate without fear of negative consequences? The proposal is that an ethical way of using the ITC process is to let participants be given a real choice of whether they want to take part in it or not. When the process is introduced in educational settings or at workplaces, it ought to be introduced as an entirely voluntarily practice. And when people have consented to involve themselves, their consent needs to be renewed continuously through the process.

It is possible to see Kegan and Laskow Lahey use of the ITC process as a primarily exogenous change devise, and a more ethical approach would be to use it as an endogenous process, where the change grows and is determined from within the individual. If the ITC process is to be used, it needs to be carefully introduced in a supportive environment with engaged and competent teachers who are willing to share and scrutinize their own assumptions about this exercise. Participants' developmental capacities for the complexity of performing the ITC may make its component parts impossible for some participants to complete. A great challenge is how facilitators can first ensure that their targeted participants are suitable for the process.

The relationships among participants, ITC facilitators, and the demands of the ITC process need to be scrutinized further. The ITC process requires at least systematic reasoning, where one can reflect on, compare/contrast, and discuss thoughts and feelings. Twenty-five percent is the highest commonly-estimated (in the adult development field) percentage of people in Western settings who can perform tasks at the systematic stage. Not all participants want to expend that effort or can. With a supportive facilitator, some people will be helped. Arguably more important, a skillful facilitator will be aware of subtle nuances across individuals in a group and lift demands from people who do not want to be part of an ITC process, or who may need an alternative, less challenging exercise.

The main conclusion is that inherent structures in the ITC process might produce some of the unintended results where people do not want to or cannot participate as a facilitator intends. If filling in the four columns requires systematic capacity to put formal relationships together, then abstract and formal stage participants, likely present in both the university student population and many workplaces, will probably be “in over their heads.” This represents an important area for further research in the field of adult development, education, and organizational development.

The proposal in this article is that what is missing in the ITC process is that adult “development” is not used *as a perspective on* the ITC process to pre-understand possible successes and failures. For example, in educational settings, it is an improvement if education is structured to promote mental complexity. But this means that not only must we be aware of students’ qualitatively different ways of learning, making meaning, and processing knowledge, but we must also take as a starting point people’s different levels of comprehension and construct different circumstances and experiences better tailored to these differences. Until we have sufficient information and the appropriate training to take this next step, we need to critically evaluate the use of transformational exercises and openly acknowledge the practical limitations, ethical matters and theoretical assumptions that they are based upon. An open creative dialogue on these matters is essential and I invite and request imaginative responses. The question for consideration by those using the adult development perspective now and in the future is how to deploy an ethical synthesis that coordinates two needs: using adult developmental methods on the individual level to help adapt people to the current societal systems they find themselves in, and using adult development insights to change societal structures to allow adults to evolve endogenously. Further research is indispensable not only on the effectiveness of educational designs and transformative exercises that claim to increase the level of mental complexity, but even more importantly, on how society and organizations can be structured to honor and respect people where they are.

Reliability and Validity Tests of the Harthill Leadership Development Profile in the Context of *Developmental Action Inquiry* Theory, Practice and Method

William R. Torbert, Reut Livne-Tarandach

Abstract: In this paper, we describe how the Harthill Leadership Development Profile (LDP), a language-based instrument has evolved from Jane Loevinger's Washington University Sentence Completion Test (WUSCT), and has been redesigned to assess and offer feedback about adults' action logics in work or educational settings, in the context of Developmental Action Inquiry (DAI) theory, practice, and method (Torbert, 1972, 1976, 1987, 1991; Torbert & Associates, 2004).

Next, we challenge a recent critique of the LDP as a soft measure unsupported by published, quantitative psychometric reliability and validity studies (Stein & Heikkinen, 2009) and present both previously unpublished and previously published-but-not-aggregated studies illustrating Harthill LDP as a well-calibrated measure of adult ego-development.

Because the DAI approach to social inquiry and social practice invites us all to interweave first-, second-, and third-person inquiry and everyday action, the validity studies reported tend to concern field-based experiments seeking to generate developmentally transforming change in adults, including the researchers and/or interventionists, as well as in the organizations in which they participate.

In our conclusion, we briefly consider what a social science and a social practice based on the developmentally late action-logics will look like, once social science is recognized as embracing, not just 3rd-person empirical positivist research "on" subjects, but also 1st-, 2nd-, and 3rd-person research and action *with* co-participants in live settings.

Keywords: Action-logic, developmental action inquiry (DAI), Harthill leadership development profile (LDP), reliability, validity.

Developmental Action Inquiry: Theory, Practice and Method

Developmental Action Inquiry (DAI) is an approach to social science and to personal and social life that posits a sequential series of increasingly complex, inclusive, and mutually-transforming action-logics through which individual persons, conversations, relationships, organizations, and scientific paradigms may evolve as they intertwinedly act and inquire.

Drawing on the first-person action research of the Gurdjieff Work tradition (Ouspensky, 1949), as well as on the second-person "action science" of Chris Argyris (Argyris, Putnam & Smith, 1985), and on the third-person developmental theorizing of Erikson (1959), Torbert (1972, 1976, 1987, 1991, 2000a, 2000b; Torbert & Associates, 2004) has demonstrated how to interweave first-, second, and third-person research methods with first-, second-, and third-

SOME RIGHTS RESERVED

person practices to study the past, the present, and the future in ways that generate single-, double-, and triple-loop feedback (Chandler & Torbert, 2003; Starr & Torbert, 2005) that leads to increasingly timely action and inquiry (Torbert & Martinez, forthcoming). We will not summarize the DAI approach any further here, but the reader will find it illustrated in the validity studies described below, and the approach is reviewed in Herdman-Barker, Livne-Tarandach, McCallum, Nicolaides, & Torbert (2010).

In 1978, Torbert chose to begin working with, and adapting, Loevinger's Washington University Sentence Completion Test (WUSCT) as the third-person empirical measure of development that most closely tracked DAI theory at that time. We now turn to the question of how the WUSCT was gradually adapted to become the Harthill Leadership Development Profile (LDP).

The Development and Evolution of the Harthill LDP

The Harthill LDP (LDP) is a language-based instrument designed to assess adult developmental action-logics as part of the third-person empirical testing of DAI propositions. The current version of LDP includes thirty-six open-ended sentence stems that, upon completion by participants into sentences, enable one to measure adult action-logics. The HLDP evolved out of Loevinger's WUSCT (Loevinger, Wessler, and Redmore, 1970), and now includes 24 of Loevinger's original items along with 12 new items designed to improve Loevinger's original test in a number of ways.

First, in order to move away from the original focus of the WUSCT on women's issues and thereby expand the LDP's generalizability, the current version of the HLDP omits a number of gender-based items such as "The worst thing about being a woman...", "A good mother...", and "For a woman a career is...". Second, to improve the tool's face validity and usefulness as a work-related, leadership development instrument, the current version includes work-related stems, such as "A good boss…"; "A person who steps out of line at work…"; "I am powerful…"; "When it comes to organizing my time…"; and "Teams…"). As will be detailed below, the responses to the new stems correlate better with an individual's overall profile rating than responses to the former stems did, thus improving the overall reliability of the measure. Together, the additional stems incorporated in the LDP introduce a meaningful and unique contribution because they expand the scope of generalizibility of the LDP to better map management oriented themes that are at the heart of developmental implementations in organizational contexts.

In addition to gradually substituting new stems for previous ones, many other changes, described in greater detail in Herdman-Barker & Torbert (2010), have been made in the transition from the WUSCT to the LDP. The names of the developmental action-logics have been changed, along with key characteristics, to make them less evaluative, more descriptive, and more useful as feedback to respondents. DAI theory posited an action-logic between Loevinger's 3 and 4, and we found that the highest proportion of most of our samples scored at this in-between point, which we named Expert and defined. DAI theory also defined the latest (and rarest) action-logics quite differently from Loevinger, naming them Alchemist and Ironist. Cook-Greuter (1999) first re-defined and successfully tested new scoring procedures for these action-logics, and Herdman-Barker and Torbert (2010) later further redefined the scoring procedure and performed the construct validity test described toward the end of this paper.

Today, the names of the DAI personal action-logics, in developmental order, are: Opportunist, Diplomat, Expert, Achiever, Individualist, Strategist, Alchemist and Ironist.

History of Reliability Testing of the WUSCT and the Harthill LDP

The 2004 Torbert & Associates book *Action Inquiry: The Secret of Timely and Transforming Leadership* (Berrett-Koehler, San Francisco) contains an 18-page appendix on the history of the Harthill LDP up to that point. That appendix contains references to a large number of quantitative studies particularly testing the reliability of Loevinger's WUSCT, from which the Harthill LDP has evolved.

We will not repeat that material here, except to let the reader know three related points. First, our own earliest attempts to do developmental research in the 1980s used the WUSCT, relying on the extensive reliability and validity findings about the WUSCT at that time, and working with WUSCT scorer Susanne Cook-Greuter to test whether respondents' WUSCT ratings corresponded to the predictions of Developmental Action Inquiry theory for how managers and other professional measured at different action-logics performed. As will be reported in the validity testing section, we repeatedly found highly significant correlations accounting for unusually high percentages of the variance in criterion variables.

Second, Susanne Cook-Greuter was a Loevinger-authorized high-reliability scorer of the WUSCT in 1980, and she was the primary scorer of all the research reported in this article until 2005. During the 1990s Cook-Greuter redefined the later action-logics and their scoring procedures, showing high reliability results. Based on 60 protocols, she and another rater trained in the new scoring procedures achieved a Pearson correlation of .95, beyond the .0001 level of significance (Cook-Greuter, 1999, p. 115).

Third, in the early 2000s, Cook-Greuter trained Elaine Herdman-Barker as a high-reliability rater of the evolving measure. Herdman-Barker is now Harthill's lead rater and executive coach using the LDP in a constructivist developmental approach to coaching with other colleagues in Harthill.

Since 2005, Harthill has conducted a further series of six reliability tests to date among the Harthill LDP's current raters. First, we tested the extent to which the set of 36 stem-responses used in LDP can be aggregated to one score reflecting the center-of-gravity profile action-logic. To do so we tested the internal consistency by calculating the Cronbach's alpha score for the 36 response ratings. Cronbach's alpha values range from zero to one, one indicates perfect internal consistency and zero indicates no internal consistency. In general, Cronbach's alpha values higher than .8 are considered satisfactory as indicators of internal consistency (Schutt, 2004). Our analysis of the internal consistency of LDP was built on 891 distinct profiles, scored between 2005-2008 and generated Cronbach's alpha of .906, a relatively high value indicating good internal consistency that justifies the aggregation of stems into one score reflecting a single action logic.

Moreover, as the LDP includes six new stems, we assessed the extent to which these stems contribute rather than dilute the LDP assessment. To do so we explored the correlation between the six new added stems and the final profile scores and found that these correlations were relatively high (.86-.89), and that these were equal to or higher than the correlation found in previously used stems. This suggests that the newly introduced stems have added to the reliability of the measure and therefore seem to be adding to, not subtracting from the reliability of total profile scores.

Furthermore, to assure that no order effect influenced the consistency of the scale we conducted two separate analyses. First, we calculated the average individual-response ratings for each stem to the total-protocol-rating correlations for every one of the 36 stems in our 891 sample of profiles. These correlations ranged from .82 - .89 with an average of .86 across all stems. As none of the stems showed dramatically low correlation and as no particular pattern of correlation size order was evident in this set, we suspected that an order effect is unlikely. Yet, to rule out the possibility that the gaps between stems scores and profile ratings may have been influenced by stems order within the LDP sentence completion form, we used a linear regression building on 891 profiles and found that stem order had a significant effect but that the size of its effect explained less that 5 % of the variance in the gaps between stems and profiles scores. This suggests that while order effect may have a statistically significant impact, the sheer size of its impact is negligible due to its low practical significance (Peterson, 2008).

Another dimension of reliability testing concerns the assessment of inter-rater reliability. As the majority of stems included in the current version of the LDP are built on prior validated work by Loevinger and Cook-Greuter, and since Herdman-Barker and Cook-Greuter had attained a documented inter-rater reliability of .69 perfect matches and .90 within one level (when there were seven different levels), we have explored the extent to which the six newest business-related stems introduced to this version yield consistent scores. An authoritative test of reliability is appropriate only after scoring manuals for all the new stems are completed, and the scorers have trained with them. Nonetheless, in 2005 we completed a preliminary reliability test between Cook-Greuter and Herdman-Barker that included blind rating of the six new stems of 20 LDP profiles and found .74 agreement within one level (again, with 7 different levels), illustrating an encouraging reliability for an initial test, though it will be important to show a correlation above .80 in the post-manual test with different scorers.

More recently, another inter-rater reliability test has been conducted, assessing inter-rater agreement between final profile scores across 805 distinct profiles that could have been scored across 13 levels of scoring (from Expert through Alchemist, with three possible levels at each action-logic [e.g., Early Achiever, Achiever, Late Achiever]. The test shows .961 Pearson correlation between the two raters, with perfect matches for 72% of the profiles and agreement within one part-stage in another 22%. Hence, there is either perfect agreement or agreement within one part stage in 94% of the cases. There was a difference of more than one full action-logic between the two raters in only one case of the 805 profiles scored. Moreover, it is important to note that any difference in the two scores was adjudicated prior to sending respondents their feedback packages. It is also important to note that what is different about this last inter-rater reliability test is that, as the reader may imagine, both raters did not separately rate all 805 sentence completion forms. Rather, one rater scored them all, and the second (more experienced) rater then reviewed the scoring, making changes on individual sentence stem scores and on total protocol rating scores whenever changes appeared warranted.

At first, this procedure may strike the empirically-positivistic, 3rd-person-social-science reader as fundamentally inadequate. Isn't it obvious that the second rater may be subconsciously influenced by the pre-existing score to agree with it? Especially, given the aim of any inter-rater reliability test to achieve the highest agreement possible? And certainly, these questions lead directly to the importance of conducting a traditional inter-rater reliability test when the scoring manuals for the new sentence stems become available. However, consider the following arguments in favor of taking this test seriously as one among several reliability tests.

In orthodox inter-rater reliability tests, both raters know they are involved in a test and are therefore likely to try especially hard to score carefully, making it likely that the test overstates the reliability one would find if both unknowingly scored the same protocols and these scores were later tested for reliability. In contrast, the raters in this case did not imagine they were engaged in a reliability test at all (the test was only conceived post hoc). Thus, the second rater is consciously motivated to make "corrections" whenever warranted (not "as rarely as possible"). And this for three reasons: (a) for the client's sake (to give him or her the most accurate reading possible, in order to best support their further development); (b) for the sake of the continuing training of the second rater; and (c) for the sake of a productive and possibly mutually-transforming dialogue between the raters. Moreover, the accuracy rate in the final reported scores is even higher than .96 because of the change in the score once a discrepancy has been noted. (Of course, the change itself will have been a "mistake" in some small proportion of the cases, but presumably in less than half, since it is the more experienced rater who is making the changes.)

Put differently, the statistics in this inter-rater reliability test are not statistics from a small sample of all the protocols used in one research project or another, but rather represent reliability testing done on a high percentage of the entire population measured. To be more precise, this testing has been performed on all the 2006-2008 Harthill post-conventional protocols (Individualist and later, which are the most difficult to score reliably), as well as on a sample of the earlier action-logic protocols, which represents continuing oversight and feedback to the less experienced rater, even though he has already attained greater than .85 reliability with the lead rater on these.

History of Validity Testing of the WUSCT and the Harthill LDP

As in the case of our review of reliability testing, we will pass briefly over the early history of validity testing of the WUSCT because this history has been so carefully parsed previously (Torbert & Associates, 2004, *Appendix: Concluding Scientific Postscript*; the entire 4th issue of the 1993 *Psychological Inquiry*; Westenberg et al. (Eds.), 1998). As with most psychological instruments, most of the early validity testing of the WUSCT addressed convergent and divergent validity assessing the relation between WUSCT and other psychological measures. For example, a number of personality characteristics have been found to be appropriately associated with predicted developmental action-logics. These include conscientiousness, trust, tolerance, interpersonal sensitivity, psychological mindedness, creativity, and rule-boundedness (in this last case, a curvilinear relationship, lower in pre- and post-conventional action-logics, higher at conventional action-logics)(Kohlberg 1963, 1964; Lorr & Manning, 1978; Vaillant & McCullough, 1987).

Since the divergent and convergent validity of the WUSCT as the foundation platform for the Harthill LDP had at that time been unusually well established, and because all of our work grew out of the context of Developmental Action Inquiry theory, practice, and method, wherein first-, second-, and third-person research and practice interweave with one another (Chandler & Torbert, 2003; Torbert, 2000a, 2000b; Torbert & Associates, 2004), we believed that our greatest contribution to the credibility of the instrument could be made by demonstrating the construct validity of the later action-logics, as well as the criterion-related validity of the instrument as a whole in field experiments where the intent was to support developmental transformation of individuals and organizations. A recent review of the developmental leadership literature (McCauley et al, 2006) highlights the unique contribution this body of work offers. In other words, our interest in using the LDP has been in pragmatic and theoretical questions of change in the real world, such as: Do managers at different developmental action-logics act differently? What kind of educational organizational structures and strategies support, not just incremental, but also transformational change in students or employees or leaders or oneself? Do leaders at later action-logics support organizational transformation more reliably than leaders at earlier action-logics?

Our use of the instrument began in 1980 when one of us was serving as graduate dean of a management school that was pioneering an "action-oriented" MBA program and that received a research grant to study the efficacy of the new program. Thus, for three years running, all members of the entering and exiting fulltime, two-year MBA cohorts (about 96 per year) were offered the opportunity to participate in research that included the WUSCT in its initial period of transformation toward becoming the Harthill LDP. (At this point, the WUSCT was modified by four managerial stems (e.g., "A good boss…") that had been independently validated (Molloy, 1978), and language that was more managerial and less evaluative (thus, with greater face validity) had been developed for offering feedback. Participation was voluntary, and participants were offered feedback on their scores, as well as the opportunity to participate in a related laboratory experiment, to be described shortly. Nine of 288 chose not to participate. This research eventuated in four distinct studies with implications for criterion validity in general and the predictive validity of the LDP more specifically.

Study 1

The first confirmation we received of the criterion validity of the WUSCT / LDP) occurred via the unobtrusive measure (Webb et al, 1966) of whether students in fact asked for, and followed through by appearing at the appointed time to receive, feedback on the results of their performance on the measure (Merron & Torbert, 1984; Torbert, 1994). None of those measured Diplomat (4) sought feedback, and only a small minority of those measured Expert (5) did so. A bare majority of those measured Achiever (6) sought feedback, whereas a large majority of those measured as Individualist (7) or later did so. In short, a larger proportion at each later developmental action-logic asked for feedback, a perfect 1.0 correlation on a Spearman Rank Order test, confirming the theoretical claim that later action-logics are increasingly open to (and increasingly seek out) single-, double-, and triple-loop feedback and learning. Understood this way, this finding supports both construct and criterion validity. It is worth noting that other factors such as age, gender, years of work experience did not explain the difference in behaviors we have documented.

There were some significant qualitative indicators of the validity of the measure as well during this unobtrusive test. One was that those who measured as in between the last conventional action-logic and the first post-conventional action-logic at that time (known only by the number 4/5, between what Loevinger called 4/Conscientious and 5/ Autonomous, and what Kegan ([1982)] called 4/Institutional and 5/Interindividual) were the only ones who participated in a feedback session who took the initiative to set a second feedback session. finding the new theory through which they were learning in a new way about who they were critically helpful in resolving the relativistic confusions in which they found themselves (this is the action-logic now denoted as “7/ Individualistic/ Pluralistic/ Relativistic/ Green”).

A second, equally interesting, qualitative discovery was the action-logic of the only three persons who chose to come to a feedback session who became angry at what the measure indicated about them. For example, one of the three began to tear up all the research sheets on the Dean’s meeting table until the Dean prevailed upon her sense of principle by shouting that she was not tearing up just her own research results, but those of others who deserved equal opportunity to tear up their own – a speech act that caused her to desist. All three of these ‘angry’ persons were among the four who came to a feedback session who were scored at the Expert action-logic, between the dependent Diplomat action-logic and the independent Achiever action-logic. One of the Expert action-logic’s defining characteristics is counter-dependence.

Study 2

The laboratory experiment we invited MBA students and alumni to participate in during the mid-1980s involved taking a three-hour ‘Consolidated Fund In-Basket Test’ designed by the Educational Testing Service (Merron, Fisher & Torbert, 1987). This test positions the respondents as directors of a community fund, appointed in mid-campaign because the prior director has been disabled in an automobile accident. The new director must deal with 34 in-basket items from staff, volunteers, and board members on a Sunday afternoon. Forty-nine MBA students and alumni volunteered to participate in this study, which, like the previous one, promised substantial feedback (not just written, but also in person) about their own and others’ results. The sample consisted of 29 men and 20 women, whose average age was 31, all but two Caucasian, and all of whom had held, or were currently holding, managerial positions in a variety of organizations.

None of the demographic variables (gender, age, or years of fulltime work experience) explained differences in performance. Indeed, at first, *when quality of performance was measured by executives hired by ETS to rate relative efficacy*, it seemed that developmental action-logic as measured by the WUSCT/LDP didn’t explain differences in performance either. However, when independent, trained raters measured the number of *second-order responses* (i.e., occasions when the director asked for or offered double-loop feedback in his or her notes), as well as the number of *collaborative actions* (i.e., when the director invited the other to influence the outcome), they found statistically significant differences between the respondents measured at conventional action-logics (5/Expert and 6/Achiever) and those measured at post-conventional action-logics (7/Individualist and 8/Strategist).

In greater detail, inter-rater reliability was 92% for the *second-order* variable and 85% for the *collaborative-action* variable. A chi square test showed that the relationship between post-conventional action-logic and *second-order responses* was statistically significant beyond the .01 level; and the relationship between post-conventional action-logic and *collaborative-action* was marginally significant at the .09 level. Two further confirming aspects of the findings are: (a) that, while the largest increase in *second-order* responses occurred between the Achiever and Individualist action-logics, the largest increase in *collaborative-action* responses occurred between the Individualist and Strategist action-logics; and (b) that there were only half as many respondents measured at Strategist as at any of the other three action-logics. Therefore, the marginal rather than robust significance of the second finding may be due to the under-representation of Strategists in the sample.

This study contributes to both construct and criterion validity in that developmental theory would predict such differences in action-complexity between conventional and post-conventional action-logic leaders.

Study 3

In the much larger ongoing field experiment in the Boston College MBA program, two whole classes (n=193) were profiled at the outset and conclusion of their program (Torbert & Fisher, 1992). In spite of the variety of challenges and supports for transformational learning embedded in the organization's regular functioning during the first year of the program (which included rotating team leadership roles, 360 assessments, developmental coaching, action consulting projects with local businesses, etc.), only 3 of the 177 who enacted the many developmental instructional technologies during their first 11 months transformed a full developmental action-logic after the full 22 months, according to the LDP. *By contrast, 15 out of 16* of those organizational participants who did all the above *and also volunteered for and won* a non-remunerative consulting role with new teams, during their 2nd 11-month participation (including depth-clinical training and processing on a weekly basis), *did transform a full developmental action-logic* (see details of this process in Torbert, 1991, ch. 4). (It is noteworthy that, since the participants who became team consultants on average rated at later action-logics than the rest of the participants at the outset of the process, the statistical effect of regression toward the mean was operating *against* the direction of the actual findings on the after test.

This finding accounts for an unusually high proportion of the variance (81%, Goodman & Kruskall's tau) of the participants in the field experiment who are measured as having experienced a transformation of action-logic. The overall results validate the transformational efficacy of a late-action-logic type of intrinsically educational organizing (called 'liberating disciplines' in DAI theory [Torbert, 1991]) that highlights the complementary roles, in generating adult development, of: (a) practical demands of real business clients; (b) depth mutual inquiry practices; and (c) voluntary commitment to one's own development.

Study 4

A field study of 16 MBA project teams (Torbert, 1987) showed that those teams (5 of the 16) with one or more members measured at the Strategist/8 action-logic outperformed teams with no one measured Strategist in three ways: in terms of grades on the two course projects, in terms of members' perceptions of efficient time-use, and in terms of members' perception of within-group support for own learning. (No one knew the students' LDP scores at the time when the outcome data were collected.)

DAI and the LDP as Predictors of CEO Performance in Supporting Organizational Transformations

In the 1990s, Torbert and his associates explored whether Developmental Action Inquiry theory and practice and the validity of the Harthill LDP extended beyond the educational world to the world of business organizations in dynamic markets. They consulted and conducted action research in numerous for-profit and competitive not-for-profit organizations that wished to transform their strategies, leadership cultures, and ways of doing business (Fisher & Torbert, 1995; Rooke & Torbert, 1998; 2005; Hartwell & Torbert, 1999a, 1999b; Torbert & Associates, 2004).

In ten of these organizations, the CEOs all participated in taking (and receiving feedback on) the LDP. In five of the ten cases, the CEOs scored as Strategists. In the other five cases, two CEOs scored as Achievers, two as Experts, and one as a Diplomat. There were four different lead consultants in the ten cases, three of whom scored as Strategists and one of whom scored as Alchemist. The four consultants worked in different combinations with the ten organizations for unusually long periods – an average of 4.2 years. Business and reputational measures showed that seven of the ten organizations improved dramatically during the intervention/studies, while the other three declined either mildly or dramatically. Based on the thick descriptions of the individual cases, three raters achieved perfect (1.0) reliability in determining whether an organization qualitatively transformed into a later action-logic, or did not change at all, or regressed (in one case, one rater differed over how many transformations had occurred in one company).

All five of the Strategist CEOs succeeded, with the help of the consultants, in leading their organizations through one or more organizational transformation. Only two of the other five organizations succeeded in transforming, and the lead consultant in those two cases was the one scored as Alchemist. Two showed no significant change, and the organization led by the Diplomat CEO regressed.

If one adds the HLDP scores of each CEO/Lead Consultant duo, then the combined influence of their action-logics accounts for 59% of the variance (at a .01 level, on the Spearman Rank Order test) in whether the organization succeeds in transforming. (Cohen (1983) classified a large effect size as one that accounts for 25% of the variance in a correlation test (that is, r=.50). A test that accounts for 59% of the variance, as this one did, represents an unusually robust empirical finding.) Thus, this study seems to support the predictive validity of the LDP and the theoretical proposition that only persons who transform to the Strategist action-logic or beyond reach the capacity to reliably support organizational transformation (Torbert & Associates, 2004).

Critical readers will, however, have many questions about possible threats to the validity of this finding, so let us examine the study more closely and consider these questions.

Testing the Third-Person, Internal and External Validity of the Ten-Organization Study

Validity criteria that test the third-person generalizability of empirical findings "after-the-fact" are enumerated and described relatively exhaustively by Cook and Campbell (1979). Their conceptualization of validity has two general components, *internal validity* and *external validity*, defined as follows:

> Internal validity refers to the approximate validity with which we infer that a relationship between two variables is causal or that the absence of a relationship implies the absence of cause.
>
> External validity refers to the approximate validity with which we can infer that the presumed causal relationship can be generalized to and across alternate measures of the cause and effect and across different types of persons, settings, and times. (Cook & Campbell, 1979, p. 37)

Cook and Campbell (1979) list 19 different potential threats to internal validity and 13 different threats to external validity. They suggest that researchers focus on the threats most likely to have a significant effect on the validity of their work. In Cook and Campbell's terms, this study is best described as a *nonequivalent control group quasi-experimental design*, whose “treatment” is the presence and action of a CEO and lead consultant at the Strategist action-logic or later and whose “effect” is organizational transformation.

The most significant threats to internal validity in such a study are the *interaction of selection and maturation*, *instrumentation*, *local history*, and *threats to statistical conclusion validity*. And the most significant threat to external validity comes in the form of *insufficient construct validity*, which is a subset of external validity (Cook & Campbell, 1979). Another important threat to the external validity of this study would appear to come from its *small sample size*.

The internal validity threat of *selection-maturation* would arise in this study if Strategist action-logic CEOs happened to be associated with types of organizations that had growth patterns systematically not encountered by the types of organizations headed by CEOs at earlier action-logics. In such a case, it could well be that extraneous causes, not CEOs’ and consultants’ action-logics, would account for the organizations’ transformation. In our study, however, there was considerable variety across the organizations that did and did not transform: a) in size (10-1,019 employees, average=485); b) in type (5 for-profit / 5 not-for-profit); and c) in line of business (investing, automobiles, energy, consulting, education, health care). In short, the successes and failures in organizational transformation are not associated with any of these variables (e.g., two of the three organizations that failed to transform were not-for-profits, but three of the five not-for-profits succeeded in transforming).

The threat of *instrumentation* arises when there are scaling problems with the measurement of the dependent variable (organizational transformation, in this case) such that changes are more likely to be measured in one group than the other. Looking into our organizations, we find differences in the baseline action-logics of organizational development of the different organizations, and we also find that the three organizations unsuccessful in transforming were among the four organizations in the study that began at a relatively late organizational action-logic. At first, this seems to suggest that the coding scheme the raters employed may not be sensitive to transformations beyond that action-logic, or that such late-action-logic transformation is much less likely to occur than transformations through the earlier action-logics. However, a closer look reveals that six of the seven organizations that were coded as having transformed actually progressed to the organizational action-logic beyond the one at which those three organizations began, thus showing that the dependent variable was in fact sensitive to such transformations and that they do occur with some frequency. In short, when organization transformation failed to occur as indicated by measurement methods, it is unlikely that a limitation in the measuring instrument was the cause.

Another credible threat to internal validity, *local history*, is troublesome if there are events exogenous to the study that affected only the experimental group and not the control group. Here, there were five experimental groups (the five organizations with Strategist CEOs) and five non-Strategist-led control-group organizations. As far as we can tell, this threat of *local history* is substantially eliminated by the variety in geography (multi-national), industry (six industries), and market niche of the ten organizations that cut across both experimental and control groups.

Lastly, *threats to statistical conclusion validity* may also endanger the internal validity of this study. Statistical conclusion validity concerns our ability to determine statistically significant (within a specified α level) co-variation between our independent and dependent variables (Cook & Campbell, 1979). In the focal study, the threats to statistical conclusion validity were minimized since the authors used the Spearman rank order test, which is the appropriate nonparametric statistical test, and found results that were statistically significant at the .01 level. (Note that nonparametric tests make fewer assumptions about the "normality" of the distribution and about uniform, interval distances between the numbers, and are, hence, less likely to make false assumptions.)

With regard to external validity, Rooke and Torbert's (1998) detailed discussion of how their operationalizations reflect their action-inquiry-informed theoretical constructs minimizes many of the threats to construct—and also, by definition, external—validity. In this study, the operationalization of the independent construct is in the form of the LDP in the period of the Cook-Greuter variant of the Washington University Sentence Completion Test (Cook-Greuter, 1999). The operationalization of the dependent construct is provided by the organizational development action-logics of the Developmental Action Inquiry theory (Torbert, 1976, 1987; Rooke & Torbert, 1998) and the reliability among the three raters.

But what about the *small sample size* in the 10-organization study? Isn't that a huge barrier to claiming that the results are in any way externally generalizable to other organizations? In fact, the answer to this question is "No." The small sample size did introduce a slightly higher risk of a Type II error (falsely rejecting a valid finding), since the statistical power is slightly less than the conventional .80. But this small-sample-size effect would have affected the interpretation of the results only if a significant correlation had *not* been found. Put differently, what an *n* of 10, accounting for 59% of the variance at the .01 level of statistical significance means is just the same as what an *n* of 1,000 at the .01 level of statistical significance means… namely, that the hypothesis is not disconfirmed, with less than one in a hundred chances that the inference is in fact false.

More than that, the small *n* of ten organizations in this study means that the psychometric measure of the CEOs' and the consultants' action-logic must be valid in virtually every single case and must be a very powerful causal variable indeed. Otherwise, neither the correlation, nor the test of significance would have been so strong. Put differently, if the *n* had been 1,000 organizations rather than 10 and the result had achieved the .01 level of statistical significance, then the hypothesis would be confirmed as it has been here, but the variable (CEOs' & consultants' action-logic, as measured by the LDP) would not have been demonstrated to be as powerful a causal factor as it has been demonstrated to be in this study.

At the same time, however, it is important to remain cautious about the generalizability of the findings in two regards. Since the largest business unit in the study had 1,019 employees, we cannot know whether the findings will hold for Fortune 500 size companies. (Indeed, we expect that the CEO's action-logic alone will account for less of the variance in huge organizations and that the action-logic of the top executive team will account for more.) Also, the organizations in this study, whether for-profit or not-for-profit, are all productive, economically-oriented, work organizations; hence, the findings may not be representative of all types of organizations (e.g., spiritual organizations, temporary political campaign organizations, families, or government agencies). On the other hand, the results should be generalizable to the 95% of business and competitive not-for-profit organizations that have 1,000 employees or less. (And… since most management research is conducted in Fortune 500 firms ([partly because they are the only ones with enough margin to be able to tolerate studies of absolutely-unknown-practical-value)], this study can potentially claim greater external validity than all of them, generalizable, as it statistically is, to 95% of all for-profit and not-for-profit organizations, rather than the usual 5%.)

Construct Validity of the Current Harthill LDP

Since 2005, Herdman-Barker, Rooke, and Torbert have further redefined the rating of the Alchemist action-logic to further align the LDP rating system with Developmental Action Inquiry theory. We have included not only Cook-Greuter's (1999) criteria for what she names the "Construct-Aware" action-logic, but also her criteria for what she names the "Unitive" action-logic, as necessary elements of the Alchemist action-logic. In addition, we have identified further criteria that we believe increase the probability of validly identifying responses generated by Alchemists' post-conceptual awareness, not just by lexical cognitive complexity. These changes are based on DAI theory (Torbert, 1991) that argues that the Alchemist action-logic is a post-structural position of continuing fluctuating awareness that easily recognizes all the action-logics from Impulsive to Elder in oneself and in social situations (for more detail, see Herdman-Barker & Torbert, 2010).

In 2008, Harthill sponsored a cluster analysis test, explicitly designed to test the construct validity test on the current Harthill LDP. The statistical technique of cluster analysis is designed to assess the extent to which a measurement tool is able to capture qualitative differences that are conceptualized in the underlying theory that the tool is trying to measure. To assess whether (and what kind of) a qualitative difference exists between Conventional and Post-conventional action-logics, according to the LDP, we analyzed the underlying pattern of two separate sub-samples: (a) 830 LDP protocols rated overall as "Conventional" (Achiever action-logic and earlier); and (b) 61 "Post-conventional" protocols ((Individualist or later). We found a striking difference between the patterns derived from these two sub-samples, illustrating the qualitative difference between Conventional and Post-conventional action-logics. (In other words, we are asking you, our readers, to attend with equal concern both to the quantitative element of this finding and to the qualitative, "presentational" [Reason, 1994] portrait of the findings below.)

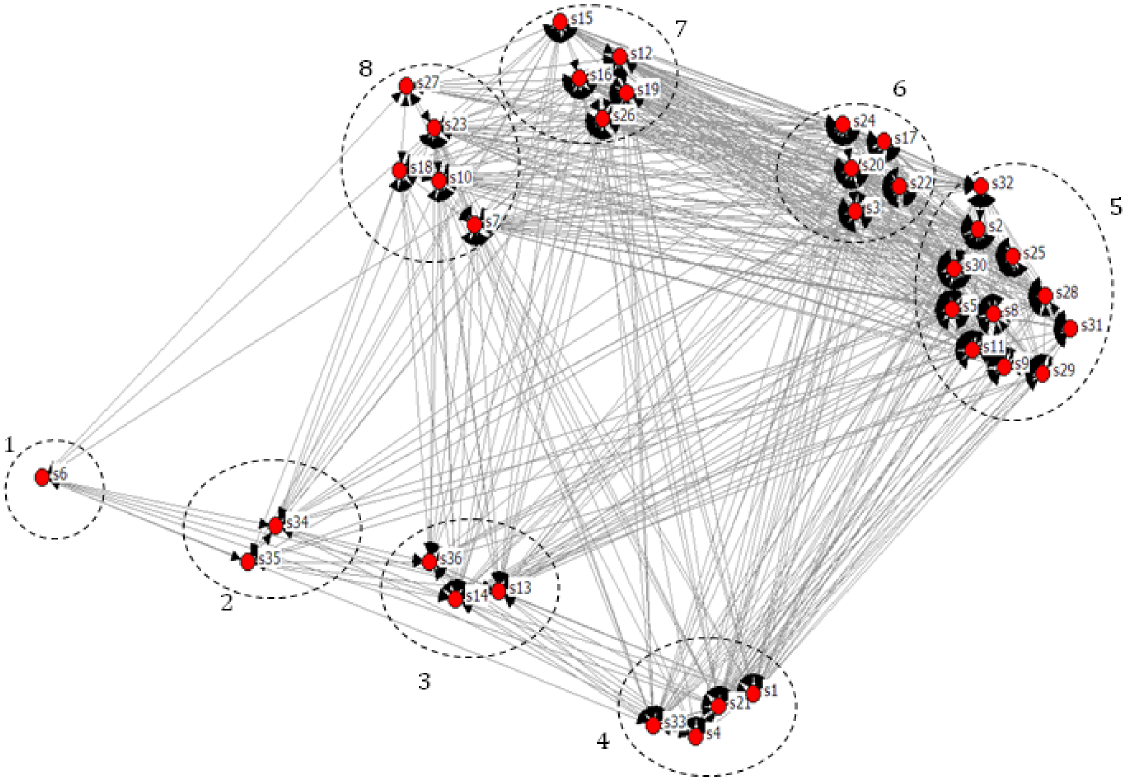

Figure 1. Cluster analysis of Harthill LDP scores on completions of 36 stems of Conventional profiles.

As Figure 1 shows, for the Conventional action-logics, stem-response ratings load on eight distinct factors, each of the eight nodes indicating a similar pattern of answers and scores.For example, stems 3, 17, 20, 22, 24 that make up cluster 6 reflect the high correlation in scores assigned to this set of stem-responses across the different respondents. Overall, this cluster analysis of the factors, or overarching themes, that emerge when analyzing Conventional LDPs is itself quite conventional statistically: distinct clusters or factors show up, with different sentence stems associated with each distinct factor.

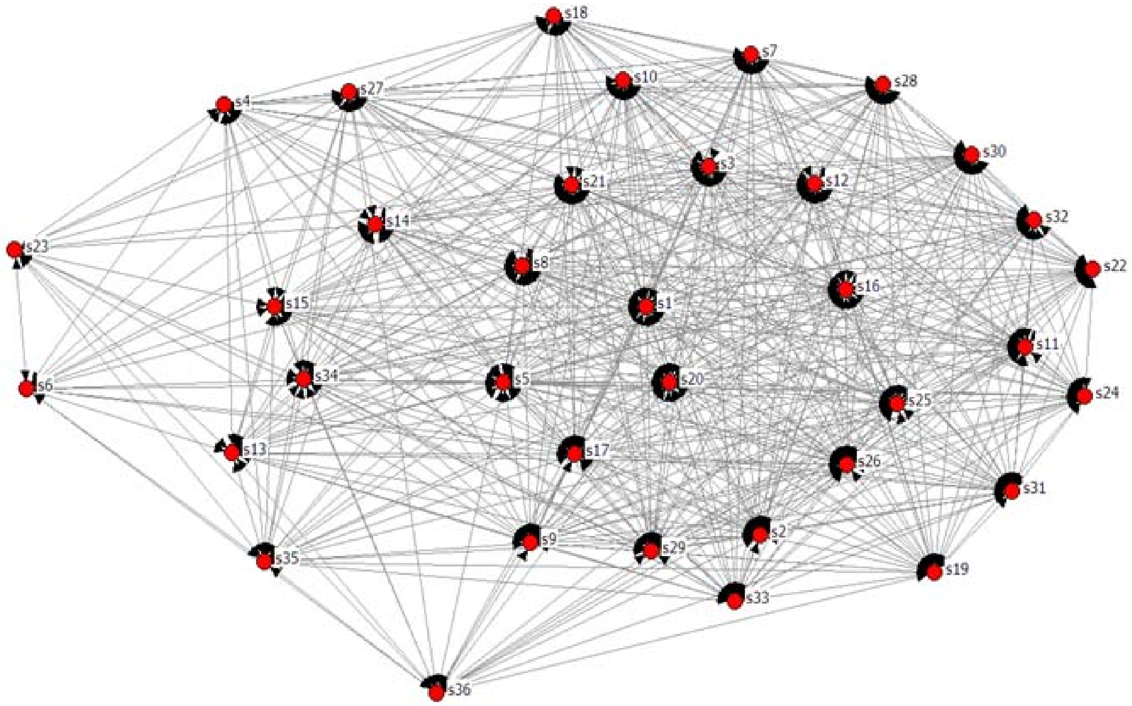

Figure 2: Cluster analysis of Harthill LDP scores on completions of 36 stems of Post-conventional profiles.

In contrast, we found a strikingly different pattern emerging from Post-conventional profiles (see Figure 2). For the Post-conventional action-logics (Individualist and later), stem-responses loaded on 11 factors, but loadings were not confined to one factor per stem. More than half (52%) of the stems loaded on two factors or more (9 stems loaded on 2 factors, 7 loaded on 3 factors, and 3 loaded on 4 factors).

These results illustrate a fundamental difference between the Conventional and Post-conventional action-logics, echoing the adult developmental theoretical foundation on which the Harthill LDP is built (Kegan, 1982, 1994; Torbert, 1991; Torbert & Associates 2004). The stably-focused Conventional loadings represent a relatively simple mental map, with Aristotelian-ly distinct, independent, lasting categories ("nothing can be both A and not-A"), as one would theoretically expect of action-logics up through the Conventional. In contrast, the complexity of the Post-conventional sets of loadings suggest that Post-conventionals hold a systems-oriented, inter-independent, "living" mental mapping process.

Plato's two distinctive images for the nature of thought in the *Theaetetus* – as either "marks on a wax tablet" of the mind, or "birds flying about in an aviary" of the mind – seem remarkably apt as metaphorical summaries of the difference between Conventional and Post-conventional thought.

Validity of the Harthill LDP on a Case by Case Basis

Because both the scientific and the pragmatic aim of using the LDP as one aspect of *Developmental Action Inquiry* theory, method and practice is to be able to support the further developmental transformations of those persons who take the measure and seek feedback about their performance on it, it is obviously crucial that the measure be as reliable and valid as possible on a case by case basis, and not merely on an aggregate statistical basis when comparing across large groups. The most recent reliability tests, cited at the end of the earlier reliability section, are performed on all late action-logic protocols partly in order to increase the likely validity in each individual case (and the associated very high reliability statistics also support the proposition that the LDP is accurate on a cases by case basis). Even more impressive are the very high correlations achieved in several of the validity tests cited above (Study 3 and the 10-organization study), which require case by case accuracy on the part of the LDP to generate such results. In addition, two recent doctoral dissertations have worked with small samples of late action-logic ratings and have shown that the measure accurately distinguishes among late action-logics on a case-by-case basis in theoretically predicted ways (McCallum, 2008; Nicolaides, 2008).

Post-Conventional Forms of Validity Testing

In addition to all of the foregoing conventional, third-person, social scientific reliability and validity tests of the LDP, Harthill also proposes, performs, and supports post-conventional, first-, and second-person validity testing of the measure each time it is offered as feedback to individuals using the measure. First, individuals are urged to make an estimate of their own center-of-gravity action-logic (e.g., based on reading Torbert & Associates, 2004) and to treat the subjective estimate as a form of first-person inquiry, triangling with the third-person, objective metric (Hartwell & Torbert, 1999a, 19989b). Furthermore, a 200-300-word personal commentary is provided with each profile, and the recipient is invited to read it in the following spirit: "This personalized commentary has been written in a spirit of invitation and inquiry (rather than as an authoritative statement of 'the truth'). It is intended to provide support and provocation in exploring your thinking, actions and opportunities for growth." Writing a developmental autobiography is an additional first-person method for exploring one's transformation across center-of-gravity action-logics during one's lifetime to date (Torbert & Fisher, 1992).

Second, individuals who have taken the LDP are urged to seek a 2nd-person form of inquiry and triangling as well. This can be an executive debriefing session with an authorized LDP debriefer, or an action-logic estimate based on the analysis, in a small community of inquiry, of the implicit framing assumptions a person makes in a difficult, work-or-personally-related conversation (McGuire, Palus & Torbert, 2007).

On the third-person scale of large organizations, institutions, economic sectors, or political regions, the aim of the DAI approach to theory, practice, and method is to build developmental research capable of generating single-, double-, and triple-loop feedback into the day-to-day operations of the institution. This enhanced feedback in the midst of everyone's everyday life should be associated with increasing experiences of adult developmental transformation, with an increasing prevalence of organizational transformations to late action-logics, and with a transformation of social scientific inquiry itself toward later action-logics. Such widespread interweaving of first-, second-, and third-person development is a challenge for the future of social action and social inquiry.

Conclusion

Why is the Harthill LDP, based on the theory, practice, and method of Developmental Action Inquiry, so powerful in explaining real-life questions like which leaders succeed in supporting organizational transformation of organizations of moderate size?

We believe it is in part because of the empirical reliability and validity of the Harthill LDP as a metric, a well calibrated measure that is grounded in extensive empirical evidence of its reliability and validity, as gathered together in this article.

But the metric can only be so powerful because Developmental Action Inquiry theory describes distinctive action-logics through which persons and organizations predictably pass, as they become increasingly open and committed to integrating action and single-, double-, and triple-loop inquiry at the 1st-, 2nd-, and 3rd-person scales in the service of timely, mutually-transforming actions.

In general, what one sees in the transformation from the Loevinger WUSCT to the Harthill LDP, traced in this article, is typical of developmental transformations from Conventional action-logics to Post-conventional action-logics. First, the 3rd-person, Expert, Empirical Positivist scientific base (Torbert 2000a, b) of the original Loevinger WUSCT is preserved and enhanced over the years. Second, new, post-conventional action-logics are conceived, defined, and operationalized through Cook-Greuter's, Herdman-Barker's, Rooke's, and Torbert's work. Third, the 3rd-person measure is re-oriented so that it can play a role in a wider field where the effort is to integrate it with practitioners' 1st- and 2nd-person research and practices in the midst of daily work and life. Then it is tested in action for the rest of one's life, not least in the overlapping, de-centralized communities of inquiry one develops with friends to face the end of life together.

Thus, the Harthill LDP emerges from, and re-presents, a relatively late-action-logic Developmental Action Inquiry paradigm of social science and social action, wherein a psychometric measure is developed as-part-of-widespread-communities-of-inquiry-participating-in-an-integral-system-of-mutually-responsible-action-and-inquiry-in-the-present.

Toward Integral Higher Education Study Programs in the European Higher Education Area: A Programmatic and Strategic View [1]

Markus Molz [2]

Abstract: This essay somehow arbitrarily freezes my ongoing attempt to grasp the present situation and future possibilities of higher education courses, programs, institutions and initiatives that are inspired by integral and likeminded approaches. The focus in this essay is on the European Higher Education Area and its specifics, whereas some implicit or explicit comparisons with the USA are made. My reflections are triggered by the recurrent observation that in Europe there seems to be i) more demand than offer of integrally oriented higher education programs, ii) an imbalance between overused but little successful and underused but potentially more promising strategies to implement such programs, iii) little or no learning from past failures, and iv) little mutual awareness, communication and collaboration between different activists and initiatives in this field.

The context for this essay is i) the current societal macroshift, ii) the unfolding of academic level integral and likeminded research worldwide, and iii) the large scale reform of the European Higher Education systems brought about by the Bologna process, its (false) promises and the potential it nevertheless has for realizing examples of a more integral higher education. On this basis the consequences for attempts to overcome a relatively stagnant state of affairs in Europe are discussed. Given that; most past attempts to implement programs inspired by an integral worldview have failed from the start, or disappeared after a relatively short period, or are marginalised or becoming re-mainstreamed, this essay aims to devise a potentially more promising strategic corridor and describes the contours of the results that could be brought about when following a developmental trajectory within this corridor. This futurising exercise is inspired by principles shared by many integral and likeminded approaches, especially the reconsideration, integration and transcendence of premodern, modern and postmodern structures and practices of higher education.

This essay is programmatic and thus deliberately combines facts and values, past and future, summaries of first person observations and third person factual information, without the burden of systematic referencing required by scholarly writing. It does not claim to replace empirical surveys which, however, are still lacking to date regarding the actual state of affairs of higher education inspired by integral and likeminded approaches in Europe. Accordingly, at this stage, the essay is an exercise of awareness-raising to stimulate more and better collaboration across streams, disciplines and countries between those scholars, students and activists who are already inspired by integral and likeminded

Acronyms

In this paper the following four acronyms are used:

ILA = Integral and Likeminded Approach
HESP = Higher Education Study Program
HEI = Higher Education Institution (regardless of the more specific type like university, institute of technology, institute of teacher education, polytechnic, business school, art school etc.).
EHEA = European Higher Education Area

The first and the second acronym have been created because of their frequent use in this paper, the third and fourth are widespread official acronyms.

Overview

> *We believe the next transformation will give rise to the integrative university or transversity representing the next stage in evolution from the university and multiversity. The transversity is a new institution that will be multi–dimensionally connected not only within and across disciplines, but across cultural boundaries and across barriers to the broader society that separate it from primary education, industry, business, government and other institutions. These integrative universities will become living institutions in which organizational structure and patterns of behavior provide permeable boundaries to the outside community with fluid internal boundaries that allow people and resources to coalesce around prominent issues, opportunities, and challenges. These changes will enhance the exchange of research expertise and practical knowledge between universities and society*. (Awbrey & D. K. Scott, n.d.)[3]

> *What is needed now is a kind of university that has never existed before.... I propose that we can and should remake the university so that it becomes an intentional force for good in the world. Such a project runs counter to the kind of academic analysis that is modelled in the university today, for it is a project informed by care and passion and developed from within a distinct philosophical commitment and political interpretation.* (Ford, 2006, pp. 8-9)[4]

We are facing tremendous opportunities and threats, individually and collectively, in today's increasingly complex, interrelated and dramatically changing world. Globalisation and the associated far-reaching developments across all domains make heavy demands on almost all of us, and opening up new opportunities at least for some. Overall, we are experiencing and co-producing a growing rate of change not only impacting ourselves, but so many future generations such as has never occurred before in the history of humankind. In Europe and other parts of the world we are already in the midst of a profound and irrevocable cultural transformation which is not only an economic or a technological one, but a macro shift (Laszlo, 2001) concerning the dominant worldviews, lifestyles, life worlds, and their governance. Only two or three times since the dawn of the species Homo sapiens on planet earth did human societies undergo such a profound transformation. Through the second wave of globalisation in the last 20 years or so we are on the way to a new societal formation beyond the industrial nation state model. Some are inclined to perceive this as a lethal global crisis – for many good reasons linked to data-based mega-trends – others as the possible dawn of a new, more inclusive and peaceful planetary civilisation – for other good reasons more linked to vision, values and creativity. Whether the unprecedented accumulation of intractable problems or the upcoming wave of new opportunities is highlighted depends on one's position, perspective and temper. It might be wise, however, to keep closely in touch with both, as do integral and likeminded approaches (ILAs).

---

[3] Scottish-born nuclear physicist David Scott was Director for Research at the Cyclotron Laboratory, Vice President for Academic Affairs, and Professor of Learning, Science and Society at Michigan State University, and then served as Chancellor of the University of Massachusetts at Amherst 1993-2001.

[4] Marcus P. Ford is Professor of Humanities at Northern Arizona University and serves in the integrative Comparative Cultural Studies program.

Scientific research, through its technological and technocratic outlets[5], has been one of the most important enablers and amplifiers of the earlier and the contemporary wave of globalisation. Unfortunately however, the educational and ethical aspects of scientific developments are lagging behind the technological ones which found their way into practice much quicker.[6] For this reason academia has today the prime responsibility to support individuals, organisations and societies through appropriate research, higher learning and service to communities to understand and utilise the high level of complexity of this macro-shift as productively, sustainably and inclusively as possible. Many ILAs are foregrounding individual development and collective evolution in a multidimensional and emancipatory perspective. When facing uncertainty and standing on shifting sands, as we all actually are today, they appear as suitable and timely contributions for inspiring higher education for the 21st century.

It appears, however, that there are major obstacles to an implementation of higher education study programs (HESPs) inspired by ILAs. In order for implementation to meet the breadth and depth of contemporary challenges and the speed of actual change, various issues must be overcome. For example institutional inertia and hyper-specialisation deeply inscribed into the structures and mentalities of academia on the one hand, and lack of professionalism and strategic collective power in many upcoming projects and initiatives based on ILAs on the other hand. Another factor playing a role are the low levels of communication and collaboration between streams representing different ILAs which generally tend to emerge as rather self-contained communities. The overall consequence is a considerable lack of overview, grounding, potential insight, mutual constructive criticism, and practical synergies. As a result, the absolutely crucial shift towards locally and globally sustainable lifestyles is much less than optimally stimulated and amplified by higher education and research. Therefore, leaving aside differences in emphasis, most ILA-inspired thinkers and activists would agree that the agenda of today’s mainstream higher education and research needs to be complemented, broadened, and reorganised in order be able to reasonably tackle the new requirements related to the current macroshift.

Through European, and later North Atlantic imperialism, modern Western universities have become the globally dominant model of higher learning and of the definition of valid and useful knowledge. They have been profoundly shaped by, and instrumental to the development and stabilization of industrialized nation-states. The current global challenges and the globally emergent designs of knowledge-based, networked living and working bring about a new, unprecedented societal formation. On the one hand this formation strongly depends on even more powerful “knowledge” institutions. On the other hand many existing higher education institutions (HEIs) are considerably challenged by digital media, cultural / linguistic diversity, post-materialist values, transdisciplinary problem-solving demands, demographic shift, ultimate massification and accountability towards an ever larger array of stakeholders. In addition, they are particularly challenged by the strengthened competition between each other and with more agile competitors like continuing education providers, virtual and corporate universities, and with institutional less or unbounded knowledge production and dissemination over the Internet.

---

[5] Like transportation systems, fossil and nuclear energy production, military technology, information and communication technology, management fads, sustained political and economic ideologies, and the new horizon of genetic engineering.

[6] Coined in one of Albert Einstein’s catch phrases as “It has become appallingly obvious that our technology has exceeded our humanity.”

Consequently, traditional HEIs are under pressure and need to adapt and change to become hosts and catalysts of adequate higher learning in this century. All this being said, new models of HESPs are called for, building on, reorganising, extending and transcending current structures and practices of higher education, models that embrace dialogical, plural and integrative practices regarding the worldwide quest for knowledge, wisdom and appropriate practice in midst of turmoil, breakdowns and difficult to track new emergent patterns. HESPs inspired by ILAs can and should play a substantial role in this transformation. Until today, however, the (although limited) institutionalised offers in the USA are not equalled by anything comparable in the upcoming European Higher Education Area (*EHEA*). Both areas of higher education show up with a comparable number of students and HEIs. They are the two largest ones in the world,[7] and the hosts for the largest proportions of all international students worldwide. Given that many of the historical lead figures of ILAs are Europeans or learned from Europeans there is one more good reason to push the development of HESPs inspired by ILAs in the EHEA. The goal then is to reach levels of program implementation corresponding to the existing potential in terms of academic teachers and students already now inspired by or interested in ILAs, but lacking academic contexts resonating with their aspirations and vocations. For this to happen the pervasive strategies of curriculum design and organisational set-up of new HESPs need to be rethought and refocused. As a requirement, the new conditions for running HESPs, generalising with the realisation of the EHEA, have to be considered thoroughly as they are partly a barrier and partly a potential vector for creating more integral approaches to Higher Education in Europe. On this basis innovative models can emerge in the interstices of the long-standing and inert structures and practices of higher education, hopefully anticipating and exemplifying a more general transformation.

Contexts

> *Without a global revolution in the sphere of human consciousness nothing will change for the better in the sphere of our being as humans and the catastrophe toward which the world is headed – whether it be ecological, social, demographic or a general breakdown of civilization – will be unavoidable.* (Havel, 1990)[8]

In this section the ground will be prepared for the strategic reflection in the section on Strategies by considering a range of contextual influences on higher education, research and integral approaches in Europe and beyond. Specifically, transformation in society and the rise of integral consciousness, the evolution of research paradigms, and the realization of the European

[8] In his address to the United States Congress, Washington, February 1990. Václav Havel is a writer, dramaturge, and politician. He was one of the major critics of the Soviet regime and an important activist in the velvet revolution of 1989 upon which he became president for 14 years, first of Czechoslovakia and then of the Czech Republic. For both his literary and political work he received numerous awards. A cross-cutting theme in his writings is the alienation and fragmentation of the life of the modern human being determined by science and technology which have taken the place of the Highest.

Higher Education Area. Those who feel already well acquainted with one of these contexts can skip the respective subsection without hampering the understanding of the following main sections (Strategies and Contours) containing the core arguments of this paper.

Transformation of Society and Rise of Integral Consciousness

Historically, in Western societies there has been an evolution from an almost pervasive dominance of the religious over other societal domains (politics, economy, knowledge and media) to a relative or in some countries absolute separation between the church and the state. This transformation enabled the deployment of scientific inquiry that is unthreatened and unconstrained by religious dogmatism and so gave rise to modern science and higher education, fuelled by the competition between the collection of medium-sized and small countries on the European peninsula. More generally, a cognitive revolution occurred in the Gutenberg era through more widely available print publications and through the introduction of mandatory schooling of entire populations. The industrial revolution, however challenging it was for those directly involved in it, ended up with higher living standards and life expectations, and the development of democratic regimes guaranteeing women's and minority rights etc. in what is called the Western world. Through the process of secularization the impact of religious institutions declined as well on the life of the average individual. Today, in certain geographical areas in Europe traditional local faith communities are threatened with disappearance. At the same time a patchwork of new "spiritualities" has been emerging. Rational science, powerful technology and material abundance of the broad middle classes of Western countries apparently has not ruled out transcendent aspirations as earlier proponents of the Western-style enlightenment project would have expected. Nevertheless, in most parts of Europe, an enduring uneasiness in the relationship between science and spirituality resulted from these historical processes.[9]

From the internally fractured and blood-saturated European soil not only the cognitive and industrial revolutions were expanded globally, but as well colonialism and the two world-wars. Colonialism, nationalism and war cannot be separated from the Western enlightenment project which, in Immanuel Kant's[10] famous definition was meant to be "man's leaving his self-caused immaturity" towards the enactment of the values of the French and other revolutions, freedom, equality and solidarity. Colonialism, nationalism and war have been Western enlightenment's continuous condition, companion and shadow-side. And they still are, just in different disguises, as today, on a global scale, some are much more free and equal than others, and some are included whereas others are excluded from the circle of solidarity and care. We are lucky of course that the Cold War, artificially forcing Europe and the whole world into two ideological camps, East and West, communist and capitalist,[11] did only almost but not actually explode into a hot nuclear third world-war. But as a matter of fact we don't need to wait for the third world-war as it is already taking place day after day, through the neo-colonial socioeconomic imbalance and injustice between the global North and the global South which is structurally reproduced on the basis of the historical world-system put and kept in place by the North Atlantic nations. Accordingly, not only the material conditions are highly asymmetric, but as well the geopolitics of knowledge. Knowledge and power goes rather one-way from the global North to the global South whereas migration (brain drain) and resources go the reverse way. What is lost in the middle is dignity of life for the (much too) silent majority of humankind, and the ecological balance of great many natural habitats, including the global habitat of the globalised humans themselves.

---

[9] Compared to the USA, lower levels of attendance of faith communities and of communication between science and religion can be observed in most European countries in which different historical trajectories have produced similar results: whether in the radical French state secularism in which spirituality is banned from the public sphere, including schools and universities, whether in Germany where 12 years of Nazi regime were sufficient to create a transgenerational suspicion regarding everything not appearing neatly rational at first glance, whether in several Eastern European countries under former Communist rule in which atheism became the new state religion and which survived the fall of the Soviet regime in the attitudes of important sections of the population.

[10] As a case in point, Kant's otherwise ingenious world-centric life work is not at all free from Prussian cultural chauvinism.

Given the deep implication of generations of Europeans in these historical dramas, directly or indirectly, intentionally or unintentionally, it has come somehow as a miracle that now, as an ongoing political, economic and sociocultural project, the very first transnationally integrated society of the planet is shaping up step by step in the last 50 years on the European peninsula: the *European Union* has become an undeniable reality despite the waves of developmental crises it is undergoing and despite frequent contradictions between great ideas and weak realizations.[12] Some of the hallmarks of the current transition in European countries and elsewhere from industrialised nation-states towards a transnational or eventually global networked society are:

- The high impact of major breakthroughs in physics, genetics and information technology and their associated technological opportunities and threats;
- A quick and profound demographic shift with far-reaching consequences through dropping birth rates, further rising life expectation and highly controlled immigration, producing a rapidly ageing society;
- A growing instability of the global financial and economic system and growing socio-economic inequalities between social classes and between prospering and declining regions, between employed and unemployed, coupled with persistent and ever more rising public debt;
- An extreme dependency on the availability of fossil energy carriers whose availability is declining, and a generally completely unsustainable lifestyle and associated long-term ecological degradation, some of which has already become irreversible, as reflected by global climate change, loss of biodiversity and fertile soils, accumulation of dangerous chemicals and nuclear particles in the environment and in the food chain;
- Wide-spread health problems typical for (post-)modern societies (cardiovascular diseases, obesity, diabetes, addictions, depression, burn-out, …) despite a medically highly sophisticated health care system and high life expectations.

---

[11] Very much paralysing as well the States of the Non-Aligned Movement who precisely tried to escape from it.

[12] As well as some well-realized bad ideas like export subsidies for European agricultural products destroying local agricultural markets in countries the EU is claiming to support in their development.

- Threats for the Western-style democracies by new religious fundamentalisms, global terrorism, political populism and most of all, frustrated disinterest of a growing number of non-voters.
- Repeated attempts at economisation of all spheres of life (and Westernisation of all cultures) in terms of the dominance of one worldview and lifestyle over all other worldviews and lifestyles.

In the face of these developments, the political inertia and lack of collective anticipatory learning made us loose the period of more than a generation through inaction, insufficient or inadequate action despite well substantiated early and recent warnings.[13] The systemic incapacity of most contemporary decision-makers to influence any of these global trends substantially is becoming more and more evident. However, there is a growing awareness of all these developments among those who are well-educated and critical, and many are starting to realize that these trends taken together are going to have disruptive effects, and that many of the measures implemented are often rather part of the problem than of the solution.[14] The part of the measures that could be helpful is generally implemented too late, too slowly, too modestly and too unsystematically. The more overarching visions for a plan B[15] come from outside the centres of power and decision making and infiltrate them only in downshifted and fragmented versions. What makes things really embarrassing is that apparently there is no plan C (preparing for *catastrophes*) or D (generalised *disaster* management) even though this is likely what is needed in this century. The goals of the political realists are rather coined in terms of “reducing the acceleration of the growth of …” (many issues can be filled in the slot: public debt, global warming, uncontrolled proliferation of nuclear weapons etc.) The dominant discourse is that there is no alternative to the overall path of socioeconomic “development,”[16] and the idea is that growth can now somehow miraculously become green growth. Undifferentiated notions of growth and development are and remain the long-time favourites of verbal narcotics in political discourse and action across countries and political parties that are immune against contrary evidence (Rist, 2002). Under these conditions the UN millennium development goals,[17] coined in the same terms, are more than likely to remain utopian even when considerably stretching the deadline that has been fixed (2015).

---

[13] The report to the Club of Rome “Limits to Growth” (Donella H. Meadows, Dennis L. Meadows, Randers, & Behrens, 1974) that has become a bestseller in many countries being a major case in point. But until today, as the 30-years update of this report shows (Donella H. Meadows, Randers, & Dennis L. Meadows, 2004) or Ervin Laszlo’s (Laszlo & Seidel, 2006) take on the same issues, actual action is lagging behind available and more and more specified insight and action potential. See as well footnote 15.

[14] The way the current globalised financial crisis is tackled is a case in point which will amplify international imbalances, future global problems, and intergenerational injustice.

[15] Many Plan B’s have actually been devised until most recently, in scientific (Rockström et al., 2009) and in popularized (Brown, 2009) versions, but as they all imply substantial changes in Western consumerist lifestyle they linger at the margins of actual political action, even though certain political discourses start to rhetorically take up some of those Plan B elements that appear less threatening to the electorate (and to political careers).

[16] This is perhaps the biggest case ever of a TINA (“there is no alternative”) – formation. TINA-formation is a term Roy Bhaskar has introduced in his work, referring to Margret Thatcher’s famous expression, as an invitation to forcefully and intentionally explore the alternatives to “no alternatives” (Bhaskar, 2002, pp. 202-204).

[17] www.undp.org/mdg/basics.shtml

Actually, to run “business as usual” “without an alternative” equals being a generation which is unabashedly living on the basis of the heritage of its children and grand-children rather than the other way round. The fact that this is now happening on a global scale is a historical first. This alerting reversal, if continued, unmistakeably foreshadows an “end of civilization as we know it” – scenario (e.g. Diamond, 2005). The causes for this likely scenario are known by many of those who bring it about before the breakdown has actually taken place on a broader scale – this is another historical first. An array of curative and preventive measures are known and at least partly available but not (sufficiently) employed – this is a third historical first. These three historical firsts combined make humankind very much appear as travelling on planet earth as a suicide bomber.[18] On this basis there is one big unanswered question, and it is unanswered because it is taboo to ask it in the first place: How to act appropriately after it’s too late?

In this overall context the European Union, through its Lisbon strategy[19] and its reform treaty[20] wants to strengthen its path towards a transnational, sustainable, open and inclusive society but, at the same time, become the most competitive and innovative knowledge economy of the world. That goal is stated in the nowadays pervasive economic slang. But even when striving for alternative futures in alternative terms, there is a large consensus that research, innovation and lifelong learning are key. What is rarely considered, however, in European policies – and in other regions either – is that the current challenges cannot be overcome by learning and innovating more and faster in any linear way. There is little awareness yet that the core issues of societal macroshift need to be addressed on the much deeper meta-paradigmatic level of worldviews. Only then can the contemporary predominance of partial perspectives and of specific levels (national) and domains (economy) become more balanced. This requires a deep, multidimensional transformation.[21] This transformation cannot be caused in any straightforward way, though. However, it is possible to create and cultivate organisational and educational environments that are more receptive and conducive for its emergence than this is generally the case.

As a proxy for this transformation we can look at empirical research on values change.[22] This line of research has quite consistently shown that the distribution of value systems held by specific sections of the population is shifting in time. It appears that in the last generation or so a growing percentage of the population of Western countries identifies with post-materialist values. This section starts to represent a separate force, distinct from religious traditionalists and secular materialists – or at least would represent a separate force if more mutual awareness and coordination was established. Individuals identifying with post-materialist values tend to be more interested in quality of life than standard of living, psycho-spiritual development than material security, relational care than untempered competition, cultural diversity than identity politics, environmental protection than exploitation of nature, social justice than domination.

---

[18] There is generally much indignation, and rightly so, when people called terrorists employ a similar approach on a much smaller scale and harm or kill innocent bystanders and children. The lack of indignation regarding our own involvement in collectively employing the same approach on a much larger scale is striking and shows that the mirror image is not understood.

[19] http://europa.eu.int/growthandjobs/key/index_en.htm

[20] http://europa.eu/lisbon_treaty/index_en.htm – after years of intensive struggle and contestation the reform treaty is just now entering into force. For the new lighthouse positions of a President of the EU Council and of a High Representative for Foreign Affairs which the treaty creates two politicians almost totally unknown to the European and world public have been appointed.

[21] Or even more deeply, a *mutation*, as Jean Gebser (1985) contended.

[22] Like the World Values Survey (www.worldvaluessurvey.org), and the European Values Study series (www.europeanvaluesstudy.eu), among many more specialized or geographically more limited studies.

This (inter-generational and to a certain degree intra-generational) values change in a section of the population is probably too recent to attract wider awareness, but it is empirically undeniable. In many countries the growing proportion of the population holding and enacting post-materialist values is not yet properly represented in the post-war system of political parties and does not yet have a substantial impact on the existing public educational provision. But as a matter of fact it has a different pattern of consumption and is quite active in cultural production and civil society organisations. These people holding post-materialist values actually become more and more organised in multiple groups, networks, projects and training programs. Mostly this occurs outside formal political and academic contexts in informal meetings, associations, and settings of coaching, consulting and alternative adult education. Many of these initiatives are often still largely isolated from each other and unaware of their commonalities, especially across domains, streams and countries. But day after day there are more of them.

Conclusion

Vaclav Havel's contention introducing this section says it all: either we are bringing about a leap in consciousness and substantial transformation of our post-war consumerist Western lifestyles within a generation or civilisational decline if not cataclytic breakdown will take over. The time window for this to be catalyzed is shrinking very quickly, and in many respects it is already too late. There are signs, though, that the leap in consciousness has indeed started to take place in growing sections of Western populations and elsewhere, and that these sections are among the best-educated, critical, spiritually interested, and engaged in civil society initiatives. However, there are too few educational opportunities yet reflecting and enhancing their values, attitudes, knowledge quests, practices and lifestyles (especially so in publicly recognized forms of higher education). On this basis the need for information and knowledge, discussion and networking, training and competencies, research on and practice of ILA's is already sensible and is very likely to grow steadily in Europe and elsewhere.

Today, there is no other reasonable way to influence the (true but partial) rationalistic, science-based, and technologically propelled power base of the Western world than to target in its heart: the scientific enterprise and its underpinnings. Transforming academia from within is necessary because the techno-scientific power-base in its current globalised performances reveals severe (self-)destructive tendencies. It is very efficient with regards to isolated processes but evidently very little effective with regards to cross-cutting issues, higher purposes and long-term sustainability (Maxwell, 2007). As a consequence ILAs have to make inroads into academic research and training or they go nowhere, and higher education thus goes nowhere as well.

Evolution of Research Paradigms

> *The creation of our current global problems, and our inability to respond adequately to these problems, has much to do, in other words, with the long-standing, rarely noticed, structural irrationality of our institutions and traditions of learning, devoted as they are to acquiring knowledge dissociated from learning how to tackle our problems of living in more cooperatively rational ways. Knowledge-inquiry, because of its irrationality, is designed to intensify, not help solve, our current global problems. Inquiry devoted primarily to the pursuit of knowledge is, then, grossly and damagingly irrational when judged from the standpoint of contributing to human welfare by intellectual means. At once the question arises: What would a kind of inquiry be like that is devoted, in a genuinely rational way, to promoting human welfare by intellectual means? I shall call such a hypothetical kind of inquiry wisdom-inquiry …* (Maxwell, 2007, p. 103)

To understand the unique contributions to higher education ILAs can make it is necessary to mention some features that became powerful forces in mainstream versions of academic research and higher education: hyper-specialisation, scientism, but as well worldview revolutions generated by scientific research itself.

The flourishing of specializations can be considered the single most important and most pervasive structural feature of the research and higher education systems from the 19th century onwards until today (Becher & Trowler, 2001). The number of institutionalized disciplines and sub-disciplines grew almost exponentially, and today we arrived at approximately 10,000 recognized research fields. Interdisciplinarity, by the way, is not a new buzzword at all, but a pretty old claim, historically arising almost together with disciplinary and sub-disciplinary specialization. However, the call for and practice of interdisciplinary endeavours has rather added to than remedied the rapid proliferation of compartmentalized pockets of knowledge generation, because it is creating uncountable new cross-over niches, hybrid sub-disciplines and many temporary projects not leaving any new imprint, coordinated perspectives or conceptual integration. The disciplinary structure and its interdisciplinary sibling help to create professional identities and cross-generational lineages at the price of decreasing societal usefulness of the knowledge produced, even more so as facts were often separated from values.[23] This drift towards scattered and "value-emptied" knowledge has reduced the possibility to communicate results beyond the small community of fellow specialists and to derive helpful recommendations for and co-operations with practitioners and policy makers.

Scientific inquiry as practiced in many of the contemporary institutional settings of higher education and research in this spirit often turns out to be scientific dogmatism (scientism) when challenged by phenomena and arguments not fitting right away in the dominant frameworks and their unquestioned background assumptions, be they modernist or postmodernist. Scientism is rather unscientifically restricting the range of legitimate questions, methods, theories and fields of inquiry. Scientism in less obvious forms seems respectable in many research communities and beyond. It is part of the strategic game of rhetorical and institutional delimitation of “true science” from other forms of generation of insight (like practical knowledge, spiritual experiences, or worldviews from non-Western cultures) – as if there could be a completely neat split. This continuous attempt to make academic science special – and superior – often lacks reflexivity, and doesn’t reflect what makes scientific research truly specific in terms of an undogmatic, pluralistic, rational, transparent and reflexive mode of inquiry. It doesn’t sufficiently take into account that the practice of the academic researcher is embedded in a multi-layered knowledge quest co-determined by a-rational intuitions, personal themes, and cultural metaphors. And it doesn’t consider the whole impact of worldview revolutions that scientific research has produced by itself, and which show the limits of understanding and dealing with reality in terms of scientism.

---

[23] As if the selection and construction of facts is not guided by values, as if relying on facts is not a value in itself, and as if one could remain neutral regarding certain facts.

If the quantum revolution has shattered the mechanistic worldview in the sciences in the early 20th century, the postmodern and reflexive turn has shattered any myth of the given in the humanities and the social sciences in the late 20th century. It appears that data is observer and theory-dependent, that language, metaphor, and cultural communities of practice play a major role in interpretation and sense-making, that there is a diversity of rationally defendable paradigms which don’t go away with scientific discoveries and advances, and that the link between knowledge and social power relations cannot be denied. Accordingly, post-positivist research approaches have gained influence, and the call for a more self-reflexive practice of scientific research has started to spread and to become normative, at least in the social sciences.

Interestingly, many proponents of quantum physics[24] and of variants of post-modern philosophy[25] came close to a post-conventional (proto-)spiritual worldview when pushing their genuine approaches to the limits. They touched a hyper-rational / trans-rational scientific / spiritual vision of reality, and couldn’t do otherwise when following the internal contradictions of their respective approaches from within. In a nutshell it could be said that they naturally arrived at the entry point of an ILA. As they can be seen as forerunners and expressions of a wider cultural transformation it can be assumed that in the near future a significant proportion of scholars and academic teachers will struggle to follow them up to that point and beyond. A promising number of smart students seem to be faster on track in this direction than many of those formally in charge to teach them.

ILAs are actually going beyond the limitations of scientism and reductionist (but as well older holistic) visions and approaches, beyond the dissociation of science and spirituality which is specific to the Western world and gave rise to modern science in the first place (see the section on contours), but as well beyond extreme relativism widespread in research communities infused by postmodern thought. To be clear, ILAs are neither opposed to specialised research nor to cultural diversity. They are widely drawing and relying and residing on both. They are just opposed to the striking imbalance between specialised and boundary-crossing research, between empirical studies regarding specific limited contexts and meta-studies. They are heading towards post-metaphysical and post-disciplinary meta-theories and “integrally informed” action derived from the recognition of all the partial but complementary worldviews, perspectives, theories, and methodologies from natural and social sciences, humanities, arts and spiritual traditions. In integral approaches scientific, artistic and spiritual disciplines are generally equally respected for exploring intertwined realms and layers of reality.

---

[24] E.g. Max Planck who said: “I have become a believer because I have been thinking until the end of thinking. We all stop our thinking much too early.”

[25] E.g. Gilles Deleuze’s “productive void,” François Lyotard’s “black void,” Jacques Derrida’s “absolute secret” – for a thorough treatment and further examples see Benedikter (Benedikter, 2006) or an early online draft thereof on http://www.integralworld.net/benedikter1a.html.

As far as I can see it between the 1850s and the 1950s more than a dozen original thinkers from different continents, thought traditions and cultural contexts introduced “integral” as a core term and as an approach of a more encompassing kind. When doing so most of them didn’t know of each other. Among them were many cosmopolitan Europeans. The fact that ILAs were born in multiple, independent streams with their specific but overlapping emphasises can be interpreted as a typical phenomenon of emergence.[26] This multi-local emergence is not widely known, not even by researchers inspired by one or the other brand of an ILA. Many of them tend to reproduce the partial historical picture storied in the stream they identify with. Some of these streams have been born inside, some outside, some at the margins of academia. In addition, many other streams having chosen other labels[27] can be considered complementing, resonating and overlapping with those that have become known as “integral” approaches. Since the 1970s a new wave of ILAs unfolded, once again in multiple streams. Today, we can look at and take advantage of a richly textured ecology of ILAs provided that cross-stream scholarly communication and reflexivity becomes more strongly developed. This is not yet the case to an extent which would be adequate in face of the globally available treasures brought to us by ILAs.

This stands in some contrast to the core motivation of ILA’s that can be seen as attempts to take into account and relate major dimensions of reality and human life to each other across and beyond paradigms, disciplines, cultures and eras. Today, it is possible for the first time in history to simultaneously access great many worldviews and practices humanity has developed and made use of in various places and contexts for various purposes. As a consequence, in today’s rapidly globalising knowledge sphere, we can consider them in conjunction as a heritage of humanity and critically reappraise them in the light of contemporary scientific research, higher learning and societal challenges.

For this to happen, we need to bring about a new step of maturation of research and higher education and to leave behind the still dominant scientific propensity to grasp and explain reality through the lenses of basically reductive models and methods. ILA’s are generally designed to complement and transcend hyper-specialised and reductionist research and education. Our times demand neither the perpetuation of eclectic pluralism or relativism, nor monistic fusion of everything into one unified theory which risks to be disrespectful of the knowledge already generated through the domain-, discipline- and paradigm-specific developments fruitfully going on for decades and centuries.

---

[26] The reconstruction of the cross-cultural and multi-stream historical unfolding of integral and likeminded approaches is the object of another line of research I am pursuing and preparing to publish.

[27] Like meta-(theoretical, methodological, …) studies and (neo-)humanist, critical realist, transformative, transdisciplinary, transmodern, biosemiotic, multifocal, complexity and quantum paradigms, among others.

Instead, developing various forms of *integral pluralism* (Dallmayr, 2010; Gidley; forthcoming, 2007; Molz & Edwards, 2010) allows basic commonalities and relationships among the multiplicity of perspectives and traditions to become more apparent, more approachable and more useful, without neglecting their differences and specifics. The challenge, hence, is to bring responsibly together the wealth of knowledge, and of quality criteria and methodologies scientific research and higher education have brought about so far, but also the practices and results of other viable paths of development of knowledge and wisdom, practical and spiritual. Contemporary ILAs are precisely designed as possible answers to this huge challenge, and they overlap in their concerns and contentions whether or not their proponents are aware of this or not.

The development and cultivation of integral knowledge, however, is but one strand of the endeavour of ILAs. Overall, it strives to value, deploy and sustain a *wisdom* adapted to our era (Awbrey & D. K. Scott, n.d.; Blasi, 2006; Maxwell, 2007; Standish, 2000). This can happen through a mindful reintegration of the (necessary and welcomed) modern differentiation between sciences, arts and spiritualities as the three major interdependent realms of human beings' expression and (co-)construction of reality. ILAs transcend the widespread representation of science as value-free and of spirituality as renouncing this-worldly affairs, as well as the idea that the practices of the arts and the sciences, the sciences and the spiritualities are necessarily at odds with each other. They are designed to develop interwoven integral sciences, integral arts, integral ethics, and integral spirituality and to raise the awareness for their multiple interrelationships.[28] Based on a widely shared emergent complexification principle of "differentiation without separation" (rather than reductionist simplification through "differentiation and separation") most promoters of ILAs are hoping to contribute to overcome the pervasive split restated in much of Western thought between subjectivity and objectivity, values and facts, theory and practice, being and becoming etc.

As much as many efforts have been put into developing more encompassing conceptual frameworks corresponding emancipatory practices are called for. Those practices invite individuals and collectives to realise their specific potential through synergetic self-transformation of body, mind and spirit, mindful communication, social service and communities of inquiry, and finally through transformative action related to the political, economic and environmental systems. There is a huge array of practices which can be composed into an integral lifestyle. This allows to follow personal preferences, habits, vocation, bliss or cultural traditions and nevertheless to live up to a shared integral ethos. On this basis it becomes possible to locally and globally inter-relate to each other and integrally co-evolve together. The overall goal of emancipatory practices is to consciously contribute to the health of the whole multi-layered individual and collective adventure of evolution instead of supporting one part or level while neglecting or being harmful to others (and by this retro-actively to oneself, immediately and in the long run). ILAs directed to small and large scale individual and institutional transformation emerge as a necessary wing of such a commitment for an undivided, interconnected and creative life. Higher education, then, cannot be an exception. Rather, it should be a priority given its purportedly central role in the upcoming global, networked, knowledge-based society.

---

[28] See e.g. the role of aesthetics in the process of scientific discovery, the technologies of artistic production, the value orientations implicitly or explicitly guiding scientific research.

However, those ILA-streams that are already engaged with questioning, infiltrating and transforming higher education are often so self-absorbed by their own intellectual and organisational development, frequently at the limit of sheer material survival, that apparently there are no (motivational, mental, time and organisational) resources left to imagine and realize overarching coordination and synergy, across streams and initiatives. Another unsolved challenge is adding to this problem: how to assure that the work of one generation (e.g. the work of the founder of a stream) is carried on by the next generation? Generally, inside academia, immediate intergenerational lineages as they are common in and constitutive for disciplinary research do not exist for ILAs. Some of the reasons for this are the lack of institutional containers: there are (almost) no ILA-institutes, study programs, degrees and labor markets. The stream-specificity of labels, networks, associations, conferences and journals prevent a common identity and intellectual space to coalesce, to be institutionalised and promoted more visibly. On this basis ILAs cannot contribute their crucial potential of complementing specialized research and stimulating new, less fragmented practices. Institutional achievements of one generation of scholars at one place tend to disappear, forcing the next wave of pioneers to invest large parts of their energy to start organising everything from scratch. The number of pioneers who see their vocation in breaching the fortresses of mainstream academia at the considerable risk of getting threatened and lost themselves, together with their families, is limited, however. The number of persons interested in ILAs, and ILA-based higher education is much largerer, and it is certainly growing from age cohort to age cohort. Accordingly, more thoroughly conceived strategies for institutionalising ILAs in higher education and research are an absolute requirement as today the critical mass of scholars and (future) students inspired by ILAs already exists whereas a sufficient number of adequate institutional contexts do not yet exist.

Conclusion

The historical differentiation of the scientific knowledge sphere from other societal domains (especially religion), and in itself, has turned in parts into dissociations that have become a road block to further evolutions in higher education, research and society. As long as analysis is structurally highly favoured over synthesis, and diving into ever smaller details more valued than the way they connect to each other, there is really a huge problem. Regardless, growing implicit and explicit demand and the urgent need for a more boundary-crossing and integrated research, education and societal problem-solving of those approaches responding to these demands, like ILAs, are largely ignored or even actively rejected by the academic world as it stands. On the other hand, inter- and transdisciplinary inquiries are today still very often plagued by a lack of conceptual and methodological grounding and they are often too loosely coupled with more specialised discourses to have a positive career impact. The deep-rooted institutional fragmentation of knowledge and knowledge production (as reflected in organisational structures, job descriptions, study and funding programs…) works like an in-built immune-defence against attempts to learn about, develop further and make use of ILAs. At the same time the worldview revolutions that have occurred in the 20th century through scientific research itself are pretty much conducive to ILAs if they were taken more seriously by mainstream researchers and decision makers in higher education.

These are reasons why the existing explicit or implicit demand arising from "unsolvable problems" in society on the one hand, and from spreading post-materialists values in the population on the other hand, is not satisfied by the academic world as it stands now, nor, by the way, by adult education providers lacking a research basis and charging high fees for their services. There are more and more initiatives inspired by ILAs popping up today but quite often they are ignoring each other, especially across national, linguistic, disciplinary and stream boundaries. Under these conditions, for reasons inherent in mainstream research and higher education as much as reasons inherent in the current (academic) practice of ILAs themselves, there is still much work to be done towards an acceptable and accepted integral pluralism which could provide a conceptual basis and viable praxis for setting up HESPs inspired by ILAs. It appears that this development could be catalyzed by more and better cooperation across streams of ILA in conjunction with more thoroughly conceived strategies for institutionalising ILAs in higher education and research.

European Higher Education Area

> *A Europe of Knowledge is now widely recognised as an irreplaceable factor for social and human growth…, capable of giving its citizens the necessary competences to face the challenges of the new millennium ...* (Bologna Declaration, 1999)[29]

In Europe, many universities emancipated from clerical authorities during the Renaissance. An individualistic humanism gained importance at that time and became a structural feature of higher education. As Latin served as lingua franca mobility of academic teachers and students across universities and countries was relatively widespread and allowed new ideas to spread with relative ease. But when universities became more and more involved in and instrumentalised for building the modern nation-states, teaching was switched to the respective national language, and new subject matters besides the classical canon were introduced. Like the nation-state, the European type of university became implemented worldwide, very much by i) 16th-19th century colonialist expansion and its neo-colonial aftermath until today, ii) the attraction of the apparent successes of technology based on discoveries in the sciences which provided an "international" language for researchers and engineers regardless their origin, and finally iii) developmentalism as an extremely pervasive political ideology of the second half of the 20th century hypnotising the global South to catch up with the North Atlantic nations in terms of the latter.

Even though the university came to the West in the 11th/12th century probably borrowing from prior Arabic models and earlier ecclesiastical schools, the foundation of new HEIs spread quite slowly across the entire European peninsula. It took centuries to fairly cover the European territory and only concerned the elites. The substantial expansion of the higher education sector is pretty much a recent phenomenon. The large majority of contemporary European HEIs have been founded in the 20th century. In addition, after the 1968 "revolution" the higher education sector expanded considerably and student intake rose dramatically resulting in the first wave of massification of higher education. To date, in the EHEA there are around 4000 HEIs in which roughly 20 million students are enrolled.[30] Despite the demographic shift in Europe a general decline of the absolute numbers of higher education attendance is not forecasted in the immediate future because i) the attendance rate per age cohort is still rising, ii) more international students are attracted to the EHEA, and iii) lifelong learning becomes more and more a policy and a career requirement, i.e. the number of non-traditional students is rising as well.

---

[29] http://ec.europa.eu/education/policies/educ/bologna/bologna.pdf

Given its history Higher Education in Europe is very much a public and state-funded affair, and compared to the USA today there are pretty few private universities. Until recently attending a higher education program at a public higher education institution was basically free and not fee-based in most continental countries.[31] Even though this is about to change in several countries the fees introduced are generally considerably lower than in the Anglosaxon countries, and any introduction of fees is heavily contested and subject to intense political struggles, and there are first cases of already implemented fees being cancelled again by a new government. So, as higher education in Europe is now undergoing the ultimate wave of “massification” and as additional public resources won’t be made available in many countries for a long time to come,[32] there is a desperate search for additional resources from third parties. At the same time there isn’t any widespread culture of private donations to higher education. It goes without saying that the current global financial and economic crisis whose effects will only really hit higher education from 2010 onwards, doesn’t make a situation better which has already been structurally bad in most places for a great many years. This has often started to affect the quality of academic learning, e.g. because of a worsening ratio of students per teacher. This state of affairs often prevents deep-level innovation spreading across isolated test areas and favours a “back-to-the basics” mentality, i.e. back to the traditional disciplines. Innovation, however, generally comes from the margins of the disciplinary mainstreams, from the interfaces between up-to-then isolated strands of inquiry, and from outside or the fringe of the academic system. There is little institutional action, however, that would actually flow from this recurrent insight from research on innovation.

These evolutions are the background for and mingle with the so-called Bologna process.[33] The Bologna process is a large-scale, transnational reform of the European higher education systems, actually the largest undertaking of targeted transformation of higher education the world has ever seen. It was started in 1999 – symbolically at the oldest university of the Western world[34] – by the ministers in charge of higher education of several European countries. To the surprise of many sceptics and of observers of past failed attempts to harmonize the pretty strong and diverse national traditions of higher education in Europe, reaching deep into the history of the creation of nation-states, this reform gained considerable momentum. Eventually it attracted 46 European countries, from Ireland to Russia and from Norway to Cyprus, to engage simultaneously in one of the most far-reaching transformations their national higher education systems have undergone since their creation. The shared overall goal of this reform is to create a common European Higher Education Area (EHEA). The process is widely supported, e.g. by supranational bodies like the European Commission, the Council of Europe, and the UNESCO European Centre for Higher Education, but as well by international associations like the European University Association, the European Students Union and the European Association for Quality Assurance in Higher Education. Nevertheless many critics have shown up and many attempts to undermine or at least limit or delay the process have occurred in various countries and disciplines (basically pleading for variants of “new wine in old wineskins” or even “old wine in old wineskins”). But in the end the proponents of this version of a TINA (“there is no alternative”) formation[35] won the battle and the Bologna process will be generalized until 2010 with only very few exceptions to its general scheme.

---

[30] Let’s assume that 0.1% of these students are more actively and consciously favouring a clearly ILA-based higher education over (post)modern study programs. This is an extremely pessimistic estimation largely underscoring the actual results of the empirical values studies available to date. In this case an educational provision corresponding to these expectations could mobilize 20,000 students in Europe. Taking into account their diverse interests regarding content and focus, and imperfect communication and matching opportunities, it still holds true that a provision that could attract thousands of students with already existing and conscious ILA-affinity simply isn’t there yet. Even less explored are the opportunities to attract the even more important number of students with a latent affinity.

[31] The case of the UK being more aligned with other Anglosaxon countries worldwide.

[32] There are interesting exceptions to this general rule in rich countries like Norway strategically investing its gains from its national oil industry into education, or Luxembourg trying to perform a late but quick move into the knowledge age by investing into the creation of a national research and higher education system.

[33] http://www.ond.vlaanderen.be/hogeronderwijs/bologna/about/

The major goal of the reform is the full mutual recognition of higher education degrees based on a three cycle system (bachelor, master and doctorate). This becomes possible through the generalisation of the European Credit Transfer System (ECTS) which is presupposing a complete modularisation of all study programs. The specific trajectory of each student is reflected in a mandatory and standardised diploma supplement based on the new European qualifications framework and their national specifications. The content and output (in terms of competencies) of each module needs from now on be described for study programs to become accredited. In some countries this does not change that much, in others this induces a radical transformation from input to output orientation, from content to competencies. Other goals of the Bologna process are the coordination of the quality management systems, the strategic facilitation of transnational mobility of students, graduates, faculty and staff, greater relevance of higher education and research for society and a better integration of higher education in a process of lifelong learning (Garrod & MacFarlane, 2007).

Even though the EHEA will be officially inaugurated in 2010 as planned at the beginning of the Bologna process certain “collateral damages” of this unprecedented multi-stakeholder effort are emphasized by the critics, among them:

- The problem that national systems based on different types of HEIs (e.g. universities and polytechnics-like HEIs) are unlikely to survive in the long run because of the formal equality of their degrees the reform has enforced, and so a unified system will become pervasive and with it the rush for ranking between individual HEIs – if this becomes true the idea of harmonization based on diversity and cooperation turns into homogenization destroying diversity and favouring strongly competitive institutional behaviours.

---

[34] The University of Bologna is believed to be founded in 1088.

[35] See footnote 16.

- The fact that today there is not much less cross-country, cross-domain and inter-institutional structural diversity of programs than before and that the transnational readability of degrees is only apparent[36] whereas internationally well-known national diplomas were forced to disappear.
- Academic freedom and possibilities for transnational mobility for students have actually been reduced rather than enhanced, at least on the Bachelor level because those first-cycle programs have often become much more school-like than the first years of the former study programs were before in several countries, with a tight, fixed and prescribed curriculum and ongoing assessment without, however, reducing the drop-out rate which was one the driving goals for this transformation. In addition, many intra-European cross-border programs which were running well before the onset of the Bologna process didn’t survive the implementation of the new constraints related to it.
- In many countries in which the doctoral level research training has not been formalized before it now becomes formalized and thus limits self-governed unfolding of personalized trajectories of research and building of unique profiles.
- The requirement to split and package the entire learning process of all students into predefined little modules which can be often quite randomly combined is much more favouring a spirit of tactically collecting credits from modules allowing to acquire them with the least effort than to engage in more organic and sustainable processes of learning related to the potential of a student.
- The specification of learning outcomes and ECTS points for each module is more often than not an artistic and rhetoric exercise rather than an approach grounded in method and data. The ECTS points are calculated on the basis of an (often simply invented or roughly estimated) average workload for a fictive average student. The extent to which the assessment of the competencies acquired through a module is connected to the competencies specified in the module description is often pretty much unclear. This approach anchored in the old-fashioned and fragmented thinking in time-slots and in the separation of curriculum planning, learning and assessment activities rather than in integrated processes of learning fosters normativity rather than individual pathways, in contradiction to the strong European diversity-policies.

If some of these critiques turn out to be or become at least partly true then in some respects the Bologna process put into practice worked paradoxically against its own well-intentioned goals. This effect is not different form many institutional reforms conceived and implemented with little involvement of those being concerned in the first place (somehow the “new wine doesn’t fit into the new wineskins”).

With regard to the second cycle (Masters programs) a twofold development can be observed so far, a development I would like to emphasize for the sake of the argument in the strategy section: On the one hand there is a tendency to just rename pre-existing programs and to try to continue business as usual (basically “old wine in new wineskins” – whereas the old wine risks to turn into vinegar through its rebottling); on the other hand in many countries with a traditional single long-cycle system now all of a sudden the first cycle and the second cycle have become structurally delinked. This has triggered a wave of creativity to develop completely new, and at least partly innovative programs in order to be attractive for students from a broader range of first cycle programs and as well for non-traditional students (professionals, part-time students etc.). Many of these truly new programs (“new wine in new wineskins”) open up specific interdisciplinary niches, have an international outlook,[37] and are run by an inter-institutional and cross-border consortium rather than by a single HEI (see sections on strategy and contours). The “Erasmus Mundus”[38] support program of the European commission, started in 2004 to complement the long-standing Erasmus program for individual intra-European student mobility, has made this development even more prominent. Through a very competitive process Erasmus Mundus selects high quality cross-border European Masters programs and endows them with attractive scholarships for non-European students (!)

---

[36] There are now Bachelor programs of 3 and of 4 years full time duration, and Masters programs of 1 or 2 years duration, and all combinations thereof. Accordingly, a Masters degree made in Europe can now reflect between 4 and 6 years of actual study. As a consequence, a much deeper understanding of individual trajectories is now required.

Another recent major transformation of academia has to be noted: many HEIs in many countries have switched from a traditional self-governance model of the professoriate to new governance styles adopted for their management. To make universities more agile small university councils have taken over the power to decide on major strategic issues. They are generally composed by a small number of personalities from different walks of life external to the HEI. This transformation was catalyzed by the new public management approach releasing decision power to educational institutions which were under direct state control before. If it is true that this managerial approach has been speeding up reform processes in many cases in which they were blocked for decades by a traditionalist professoriate, it has further reduced the already few possibilities of participatory decision-making, and of electing representatives bottom-up. In HEIs that have adopted the model of external university council the split between research and higher education managers on the one hand and scholars, young scholars, and students on the other, has become even more profound than it already was the case before. The development of such a HEI very much depends on the intellectual horizon and foresight of the members of the council, the time they actually invest in their deliberations, and the quality of dialogue and decision-making between them. It goes without saying, that in practice this varies considerably. Those councils can trigger and favour innovation as much as they can suffocate new bottom-up initiatives – in each case it really depends on just a couple of men (mostly).

If this means less democracy within HEI’s another trend democratizes access to higher education degrees. New national laws were introduced[39] that generalise and organise the possibility of formal recognition of learning that takes place outside HEI’s, in non-formal or occupational settings, for the acquisition of higher education degrees. Even though not directly linked to the creation of the EHEA these laws are very much affecting higher education. They considerably strengthen the value of practical experience and rebalance the relationship between practice-based learning and theoretical learning. The juries created to decide on requests of academic recognition of practice-based learning are generally composed of scholars and practitioners. This creates a completely new contested field in which power games and hot debates are occurring, but as well mutual learning. Many practitioners are eager to get their actual competence formally recognized whereas the professoriate is still often reluctant to accept other paths of learning than the one inside the ivory tower, but is more and more legally forced to do so. The translation of practical experience into academic subject matters or study modules is far from self-evident. It is often quite demanding for the candidate to submit an application that is bridging the two worlds convincingly. But more and more succeed, and so a new era has started in which the boundaries between the worlds of theory and practice are becoming more permeable.

---

[37] Some are run in English in countries where English is not the national language, or in more than one language, to be attractive to international students.

[38] http://eacea.ec.europa.eu/erasmus_mundus

[39] In more and more European countries – the UK and France having taken the lead.

Astonishingly loosely coupled with the EHEA is the development of the European Research Area (ERA). Transnational research and development partnerships are very much triggered by the European framework funding programs in many different focus areas. Traditionally, mixed-type and cross-sector partnerships are particularly welcome. The programs have been considerably redesigned on the basis of a quite innovative at least partly open, participatory process and an independent European Research Council has been created from scratch. The new funding schemes resulting from it have been implemented with the 7th Framework program.[40] The European Science Foundation offers additional interesting opportunities.[41] An unprecedented emphasis on boundary-crossing approaches can be noted.[42] On the other hand, it still holds true that the administrative load is important in EU projects and that it remains very difficult to acquire European research money for process-oriented research as task and outcome has to be fixed and detailed in advance. More and more applications are submitted which makes the competition quite fierce. But nevertheless it appears that sometimes ILA-informed approaches can manage to correspond well to the European research policy whereas this is often more challenging on the national level.

---

[40] http://cordis.europa.eu/fp7

[41] http://www.esf.org

[42] In a Communication of the European Commission called “Delivering on the modernisation agenda for universities” (2006) one of the required lines of action is called “Enhance interdisciplinarity and transdisciplinarity” and spelled out as follows:

> Universities should be able to reconfigure their teaching and research agendas to seize the opportunities offered by new developments in existing fields and by new emerging lines of scientific inquiry. This requires focusing less on scientific disciplines and more on research domains … associating them more closely with related or complementary fields (including humanities, social sciences, entrepreneurial and management skills) and fostering interaction between students, researchers and research teams through greater mobility between disciplines, sectors and research settings. All this necessitates new institutional and organisational approaches to staff management, evaluation and funding criteria, teaching and curricula and, above all, to research and research training. The implications of inter- and trans-disciplinarity need to be acknowledged and taken on board not only by universities and Member States, but also by professional bodies and funding councils, which still rely mostly on traditional, single-discipline evaluations, structures and funding mechanisms.

(http://ec.europa.eu/education/policies/2010/doc/comuniv2006_en.pdf)

Overall, the broadly pushed structural development of the EHEA and the European Research Area is currently going on, and will go on beyond 2010, together with waves of reforms and pseudo-reforms on the national level. On this basis, there are different trends to be observed, among them:

- Accountability towards society is going to become more important and more immediate for higher education and research institutions than before. The new governance models bring external quality assessment systems to countries and institutions in which they have not been in use so far.
- Modularisation has quickly become not only the main buzzword but a must for the organisation of any study program to become accredited. The learning outcome / competence / ECTS-slang and the according rules of the game need to be mastered.
- Hyper-specialisation in research and education is continuing but transdisciplinary approaches are getting more opportunities to actualise than before.
- Internationalisation starts only now to become really important for many HEIs. It is evolving from a nice-to-have add-on concerning a minority of incoming and outgoing students to a strategic core concern for the future institutional development.
- Lifelong learning has become a prime directive and the market for higher learning especially in postgraduate and continuing professional education is indeed ever growing.[43]
- Underfunding and restricted, structurally overregulated career paths are currently generating "HEIs short of academic teachers and researchers" (the average student / teacher ratio has been substantially growing in most European countries over the last decades) and "academic teachers and researchers short of HEIs" (there are many highly qualified researchers and academic teachers not fitting to the profiles of the job openings and the bureaucratic regulations regarding staff categories).
- Student-centred learning has very much become a trend designating most varied actual practices of teaching and learning, many of which are student-centred to a very limited degree only (see section on contours).

Conclusion

The Bologna process is such a huge undertaking, so unfinished yet and requiring reforms of the reform, that a next wave of reform of the whole higher education system in Europe, a reform of a more integral kind, is very likely to take generations to shape up. So, basically, for decades to come and despite extremely pressing societal challenges, we cannot realistically expect a methodologically more integral reform of the higher education system specifically devised to transform the structurally integrated EHEA into a substantially integral EHEA. The EHEA as conceived by the promoters of the Bologna process is a reality from now on which can neither be ignored nor circumvented. Accordingly, a thorough analysis of its problematic aspects needs to be followed by a focus on the opportunities it offers. These opportunities are mainly i) a more and more favourable climate for boundary-crossing approaches on the level of European and other funding programs, ii) the need to attract new student populations in a situation of stronger international and inter-institutional competition, declining resources and demographically diminishing young generations combined with the receptiveness of certain target groups for new programs corresponding to their values, expectations and lifestyles, iii) new spaces for creativity that can be deployed for developing and implementing new Masters programs and doctoral schools, especially by innovative inter-institutional consortia. The precondition to succeed under the conditions reigning now is to understand and master the new formal and terminological game that everybody is required to play.

---

[43] However: “lifelong learning tends to contribute to the fragmentation of knowledge, while at the same time enhancing the appropriation of knowledge by individual learners” (Kehm, 2001, p. 5).

Strategies

> *What the future of the university will be, as with all questions about the future, is unknown. Our intent is to … contour the unknowable … While historical forces will dramatically change the current university there are still choices to be made as to the shape of future universities.* (Inayatullah & Gidley, 2000, p. 13)

This section is devoted to a strategic reflection of various options and paths to developing higher education generally, and more integral variants of higher education more specifically. It appeared to me that such a strategic reflection has not yet been conducted, that the array of options is rarely fully explored, and that past failures to advance more integral forms of higher education in Europe and elsewhere may in part be related to weak, implicit, undiscussed strategies. On this basis a promising strategic corridor will be proposed within which the likelihood to advance ILAs in the EHEA and to advance the EHEA with ILAs is higher than with other strategies.

Strategic Options for Developing Higher Education

I will now first turn the attention to strategic options available to HEI's within the EHEA (and beyond), then to options available to programs, and then to options available on the course-level. On all these levels I will discuss the options most of the time chosen and reproduced by past attempts to implement more integral alternatives and complements to mainstream higher education.

For higher learning in Europe there seem to be three major institutional options:

- By far the most dominant one is the rat race within under-funded public universities and their more or less traditional faculties, disciplines and sub-disciplines;
- Second are the often domain-, purpose-, or stream-specific private or corporate "universities;"
- Finally, there are new (cross-border) virtual providers (often lacking a research-base on their own), or more traditional open universities, and their often ready-made programs.

We have to be clear, that the main structures, goals, practices and respective funding and incentive systems of none of these types of HEIs is primarily concerned with, prioritizing or structurally supportive of ILAs. Of course there are niches and margins that are potentially more conducive – we will come back to them later (see section on contours). Today, regardless the structural, strategic and other differences between institutional types, they are equally focused on assuring funding (or making money) and creating reputation (in terms of rankings, external quality assurance reports etc.). In a way, all those institutional options are likewise structurally limiting rather than enhancing innovation and transformation as perceived as necessary from the angle of ILAs. None of them fits well to the idea of a more integral higher education which is neither disciplinary nor necessarily limited to one specific practical domain nor easily transmitted as content packages dissociated from actual research and authentic face-to-face encounters.

There are probably more failures than thriving attempts in Europe to implement sustainable alternative and vanguard models for entire higher education institutions. As a matter of fact, despite a comparable size of their higher education systems (see section on contours) there is a considerable less important number of such institutions in Europe compared to the USA.[44] Many of them are financially unstable, of mixed reputation and durably marginal to the overall system. Over time, they tend to disappear, stop to further evolve after the initial impulse or to become re-mainstreamed. Even though pressures having these effects are by no means unique to the specificities of European higher education they seem to have a strong(er) impact there. Nevertheless, there are still new attempts under way to create alternative higher education institutions and of course we can only hope that some of them will be luckier than many of their "predecessors" have been.

Generally, the possibility to bring ILAs to higher education by building new, alternative, private HEIs from scratch is severely limited in Europe, even though this is precisely the dream of many academic teachers and students inspired by ILAs, or simply by those discontent with the current state of affairs, especially as they have normatively shaped higher education everyday reality through the implementation of the Bologna process. Only in case of really important donations from several donors directed to one specific project over a consequent period of time it could be hoped to create a cross-domain "integral university" in the brick & mortar sense anytime soon. Even though legal barriers and regulations for the creation of private universities have been alleviated in some European countries I already mentioned that a culture of private funding of higher education is not well developed. Another important barrier is that fees cannot be very high for all but the most elite programs and will never be sufficient to run an alternative HEI without other sources of funding. Public funds go prioritarily to the already underfunded public HEIs and the new, fashionable "centres of excellence" (creating new opportunities in a few places and even more underfunding in all others). Conceiving and realizing alternative brick

---

[44] All over Europe there seem to be little comparable institutions to long-standing private alternative HEIs in the USA like the California Institute of Integral Studies, Naropa University, The Fetzer Institute, The Graduate Institute, Saybrook Graduate School and Research Center, JFK University, San Diego University for Integrative Studies, etc. The European examples like Schumacher College (GB), University for Humanistics (Netherlands), and the Campus University of Applied Integral Pedagogy, Health and Management which is in the process of being founded (Germany) are much smaller, less developed and more strongly focused initiatives, among other upcoming projects. The University of Witten-Herdecke (Germany) can be considered a major attempt to build a private vanguard model of a multi- and cross-disciplinary university. It has gone through a series of serious crises and backlashes until recently, though, so that it remains to be seen which parts of the original vision will survive in the long run.

& mortar dreams absorb an amazing amount of time, energy and resources. If by good luck such an institution appears and remains on stage it can serve a specific function in a broader view on how to evolve toward programs of integral higher education (see section on integral organizations).[45]

The institutional level having been discussed, let's now turn to the options on the program-level because they are more lightweight and easier to realise, at least some of them. On this middle-level, basically there are three largely dominant options once again:

- The *traditional strategy* to have disciplinary programs starting in the first cycle and then continuing through the second to the third cycle. This is not only the chronological order students are running through the programs but as well the traditional way to set up new programs – like the stories of a building from the fundaments to the roof. As such continuous programs in traditional disciplines are run in many universities they attract and first and foremost students who are geographically close-by already before their enrolment.
- The *umbrella strategy* of generic programs allowing for specialisation after having taken some introductory courses of general interest. This strategy is more and more employed because the administration and promotion of many small programs is more complicated and expensive for a HEI than the administration of larger generic programs. This fits well with the general tendency to look for economies of scale but it creates at the same time additional need of student support and guidance to help them find their specific way through such a broader offer. Therefore, often, choice is relatively restricted to quite a few predefined options whereas principally more choice could be offered on the basis of this option than on the basis of the other two options.
- The *niche strategy* of small programs specialized as a whole from the outset (either in the sub-disciplinary or in the interdisciplinary sense) and attracting students partly coming from far away precisely because of the unique or rare speciality. The niche strategy is most promising for smaller departments or upcoming HEIs but often requires considerable efforts in marketing to become known and to continuously attract a sufficient number of students. It applies rather to the second and third cycle than to the first cycle.

Regarding the perspective of the development of HESPs inspired by ILAs, none of these three options really fits. Integral studies won't evolve into a discipline anytime soon, and for many ILA-inspired researchers it would be a pretty self-refuting prospect to create a new discipline alongside the traditional disciplines. Can we seriously expect integral studies to fare better than philosophy which has degenerated from the "mother of all disciplines," the meta-discipline par excellence, the purported reflective centre of knowledge building, to an ungrateful niche existence within shrinking humanities departments, scattered into its own manifold sub-disciplines? No, we can't. Under the conditions of institutional structures tuned to support hyper-specialisation we can only expect that integral studies would have an even worse position.

---

[45] A potential fourth institutional option will not be discussed here because it extremely unlikely to occur: the transformation of an already well-established (post)modern HEI into an ILA-based HEI. In Europe, there is probably no single example for such a sensational transition. In the USA one example of an attempt in such a direction was the transformational leadership of David Scott as Chancellor of the University of Massachusetts at Amherst (see footnote 3), and the creation of the Community for Integrative Learning and Action (CILA) in which faculty from the HEIs of the Five Colleges Area connected for collective activities of learning and transformation.

The umbrella option must be ruled out as the critical mass of ILA-inspired researchers and teachers isn't there in any given single HEI in Europe,[46] and there is no department with the strategy to systematically attract this rare breed of scholars to it. It is extremely unlikely that anybody manages to start an ILA-inspired study program as a broad first-cycle program and attracts a sufficient number of students from scratch to make such an effort viable. As long as the umbrella strategy is realized mainly for administrative reasons and economies-of-scale inside one larger mainstream HEI it is not likely that a whole department is willing to get rid of an existing generic program and to replace it by an ILA-based one, or to subsume a variety of more specific programs under one single, integral umbrella. This may at best happen in a non-mainstream HEI, but we already mentioned the challenges and limits linked to such a whole institution strategy, especially in Europe. Even though the umbrella strategy would make the best fit for ILAs out of the three traditional program-level options it is unfortunately the least likely to be realized.

No wonder then that the niche strategy is the only one which has actually been tried out, as far as my knowledge goes, because it allows starting small and at the margins. The recurrent downsides are weakness within the hosting institution, insufficient numbers of employed faculty, and a less than optimal differentiation of tasks / responsibilities producing a lack of professionalism in certain areas crucial for the proper development of a new program, be it administrative support, public relations, teaching, research or quality development. The niche strategy has further downsides for ILAs. Not only because of the internal paradox to deploy an encompassing approach within a niche and the consequence not to engage and challenge the mainstream. But as well because of an external threat: This strategy lets ILAs appear unimportant amongst the large, traditional disciplinary programs who can afford to follow the umbrella strategy. Reversing the actual relevance of ILAs in a fragmented world the niche strategy creates an image which is very much conducive to get rid of such a program in case of cuts in funding or in case of its founder and director leaving the university, or other fragile transition phases. Commonly, niche programs are naturally considered to be non essential, a nice add-on, but not very important for the future of the HEI hosting it. And so it goes in practice: if there is no institutional strategy to develop the niche to become part of the core mission of the respective HEI – and this is not widely the case – then alternative niche programs only survive by chance in otherwise mainstream settings, and are easily wiped out, merged or re-mainstreamed.

Well, then the analysis of the program-level options doesn't allow us to draw a friendlier picture for the implementation of HESPs inspired by ILAs than the analysis of the institutional options. Nevertheless, the best guess is that in the long run there will be more HESPS inspired by ILAs at traditional HEIs than at HEIs created for the very purpose to develop such programs. The reason is a simple, numeric one: in Europe there are so many conventional HEIs around and so few alternative ones that a few attempts deployed at existing HEIs can easily outweigh the number of programs on offer at alternative HEIs. I will later return to the idea that both approaches shouldn't be seen in opposition but should ideally be linked to each other to the advantage of both sides and of the greater good.

---

[46] This is different in the particular micro-climate of some of the alternative HEIs in the USA mentioned in the prior footnote.

This prediction that in the long run the strategic potential of conventional HEIs in the EHEA for developing ILA-inspired higher education is more important than the strategic potential of alternative HEIs can be related to an analysis of the course level options. I already mentioned the relative autonomy of the academic teacher in many if not most HESPs at many if not most traditional HEIs, even when declining here and there. As a space opened by this traditional core concern of academic freedom it is basically possible to introduce integral spirit, content, and andragogical approach (see section on integral andragogies) into the courses under any academic teacher’s responsibility. This can often be done without too many problems as long as traditional academic values are respected (like critical rationality of discourse, theoretical pluralism, utilisation of explicit methods, recognition of existing research in the field, prevention of plagiarism etc.), and as long as the specialness of ILAs is not too much stressed and overtly displayed (e.g. in the title of a course).

As there are many academic teachers (and students) already inspired by one or the other variant of an ILA, there are many more courses already infused by them than are overtly declared. Either an ILA inspires the content, or the andragogical approach, or both. But despite certain dangers there are even already quite a number of courses overtly displaying that they are ILA-based. More often than not, however, they are a kind of outlier within a HESP not designed on the basis of integral principles and not directed towards integral purposes nor reflecting integral content all over. ILA-based courses might formally belong to a program but not resonate with it regarding the pursued approach. This being said, we have to consider a matrix of at least – 2*2*2 – eight cases on the course level: i) ILA-based content – ILA-based andragogy, ii) covert or overt ILA-inspiration, and iii) courses resonating or not with other courses within a study program and the general approach of the overall program. This last option of several courses resonating with each other within a program comes already close to a program-level realisation.

As a consequence, the major problem so far is not that ILA-based courses are lacking altogether, but that they are isolated from each other. This isolation stems from the fact that in any discipline in any European country there are at best only a handful of academic teachers and researchers already adopting an ILA in their research and teaching, and that there are very few to adopt several ILAs at the same time, and/or deliberately working across and beyond the disciplinary lines. Accordingly, it is an extremely rare coincidence to have more than one person of this kind in the same department at the same HEI. And even two do not make up the critical mass to build an entire HESP on the basis of their respective courses, even more so as the game to gain institutional support and accreditation is far from assured in advance when it comes to unconventional orientations. Generally, those already teaching courses based on an ILA are inspired by different lead authors, teaching at different levels, in different study programs, in different disciplines, in different languages in different HEIs, in different countries. On the basis of so many heavily institutionalised boundaries, it appears virtually impossible to come to know each other by more than mere chance. Acquaintances are more likely inside the same country, the same discipline, the same ILA-stream. This is not a guarantee either. The specific situation of

ILA-inspired researchers within mainstream HEIs made many of them being used to being solitary and autonomous. As many are innovators in their specific contexts they are generally overwhelmed by more pressing tasks than looking for far away company. On this background, almost every academic teacher working on the basis of an ILA conceives, or is forced to conceive, his or her courses as self-contained units and not as being part of a cross-domain, international, integral HESP.

Conclusion

The creation of a HEI inspired by ILAs – in the more traditional understanding of a HEI – doesn't appear to be the most promising and efficient strategy to move things forward toward integral higher education provisions given that the resources absorbed by building brick & mortar infrastructures are distracted from being used right away for developing, researching, teaching, learning, and otherwise disseminating ILAs and bringing them into practical fields. None of the widespread strategies to implement new study programs seem to be very adequate either for realizing HESPs inspired by ILAs. On the other hand, on the course level there are many scattered attempts to move toward designs, approaches and content inspired by ILAs. Accordingly, these readily available resources and capacities need to be disclosed to each other much more and combined and uplifted to the program level through strategies departing from those pervasively employed in conventional higher education (with success), and more or less copied by scholars and activists inspired by ILAs (without much success).

Strategic Corridor for Building Integral Higher Education

> *In complex situations, i.e. where in the same place and at the same time there is not only order but as well disorder, where there is not only determinism but as well chance, where uncertainty emerges, there is a need for the strategic attitude of a subject; in face of ignorance and confusion here perplexity and brightness are indispensable … The method/path/attempt/crossing/research and strategy can't be reduced to a ready-made program, not more than to a statement of an individual experience; in fact, it is the possibility to find in the details of the concrete … life, as fragmentary and dissolved it is in the world, the totality of its open and temporary sense.* (Morin, Ciurana, & Motta, 2003, pp. 17, 24-25)[47]

---

[47] Translation of the quote from the French original by the author of this essay. Edgar Morin was research director of a transdisciplinary research centre at the CNRS (French National Research Centre). He is a prolific writer across many fields, since 1946, and has received numerous awards and honorary doctorates worldwide. The core of his approach to complex thinking is laid down in the six volumes of *La méthode* (Morin, 2008). He wrote a commissioned report on the future of education for the French government (Morin, 1999a) – which evidently was not followed, and another one for the UNESCO (Morin, 1999b). He is co-initiator of the International Observatory of University Reforms: www.orus-int.org and of the Collegium International on Ethics, Science and Governance: http://www.collegium-international.net. A University built on his educational recommendations has recently been created in Mexico: www.multiversidadreal.org. Edgar Morin is insisting on the fact that the necessary reform of thought under conditions of complexity and the necessary reform of higher education are co-conditioning and co-determining each other, and that one side doesn't move forward without the other.

Based on the array of options discussed in the prior section and their respective advantages and disadvantages, a strategic corridor for the implementation of more integral versions of higher education is becoming apparent. The strategic corridor is a selection of options and a more circumscribed array of paths of developmental progression which is more likely to succeed than paths following options outside this corridor. This doesn't imply that under particularly favourable conditions other options and paths couldn't succeed. It just supposes that this is more difficult and less likely. It appears that conventional ways of conceiving higher education in terms of brick & mortar institutions, in terms of disciplinary or interdisciplinary programs run by one such institution, in terms of study programs composed by courses taught by scholars who are employed by the respective institution, are not very helpful and conducive for the implementation of (more) HESPs inspired by ILAs. Accordingly, academic teachers and researchers interested in conceiving and actually implementing these kinds of new programs need to transcend such a conventional understanding of higher education, at least if they are not by great chance supported by an unconventional local context allowing to conventionally implement unconventional HESPs.

The development of a more powerful strategy can be based on at least two sources of insight. First, on a reflection of failed attempts to implement a more integral higher education provision.[48] As far as I know, there has not been any cross-case analysis of such failed attempts yet. Second, on a reflection of the characteristics of higher education systems and their major historical transformations over a long period of time (in the perspective of the last millennium, see appendix). For any integral approach to transformation of higher education in this century a proper understanding of its (Western)[49] long-term history is crucial. Such an understanding is necessary for selecting and integrating constructive features from all periods, medieval, modern and postmodern, and to transcend those features that fit less and less well in our time given the evolution of culture, social structure, educational provision and technology, and given the unprecedented characteristics of the challenging contemporary macro-shift.

Let's start with listing some major problems which I could repeatedly observe in past attempts to implement HEIs or HESPs on the basis of an inspiration at least close to ILAs:

- Investment of the limited material and intellectual resources available to ILA-inspired scholars and activists to establish a new HEI instead of investment directly in study and research programs (see this section);
- Too much idealism coupled with lack of viable strategies and professionalism regarding organisation and management (visionaries and vanguard researchers are not necessarily, or perhaps even rarely, good strategists, implementers, and managers committed to the required practical organisational work on a daily basis, see this section);

---

[48] The failed, disappeared and long-term marginal, unstable or weak attempts will not be mentioned explicitly in this essay in order not to blame those who tried hard to realize their projects and didn't reach their goals. The analysis, however, which was leading me to the suggestions and conclusions exposed in this essay have actually been conducted case by case.

[49] An extension of this analysis to the forms of higher education other historical civilizations have developed would fruitfully extend and deepen this reflection but cannot be performed in this essay.

- Lack of cooperation with enough suitably (i.e. traditionally) qualified academic staff to teach courses rooted in actual academic and professional expertise, and as a consequence avoidable problems with academic recognition of the initiative adding to the unavoidable ones arising frequently in the conventional, disciplinary, and sometimes openly hostile institutional environments (see this section and the one on contours);
- Reproduction of the individualistic bias inherent in higher education and Western culture regarding both, project development (involving often too much pride, idiosyncrasy and closure) and andragogical approach (often not differentiated from pedagogical models, see sections on integral learning communities and integral andragogies);
- Under-utilisation of the new opportunities afforded by the most advanced Web 2.0 information and communication technologies (learning management and virtual community systems; multimedia conferencing; intertwined personal, team and collective digital media repositories and portfolios etc., see section on integral organizations);
- Weak or entirely lacking international cooperation in terms of inter-institutional partnerships, transnational mobility, cultural diversity, multilingualism, global service learning etc. (see section on contours);
- Lack of institutional capacity to grant accredited, widely recognized degrees appealing to a range of potential employers (i.e. too much reliance on the intrinsic value of the offer and blindness regarding the links between the institutional fields of higher education and work, see section on integral organizations);
- Overestimation of the willingness of potential students to pay high tuition fees for unknown, beta-phase programs, in a European environment in which tuition-free programs still exist in various countries (resulting in insufficient student influx, see section on integral organizations).

The conventional structures of higher education won’t fade away any time soon given that they have been quite stably reproduced for decades and in parts even for centuries. They have their use and value, even for future HESPs inspired by ILAs attempting not only to induce change regarding the content of higher education but also regarding the “containers” and finally those persons (re)producing the content and the containers. Of course then the question arises how to connect with and influence something as inert and traditional as higher education as a system? Well, by riding on it rather than attempting to supplant or change it directly. We are well advised not to expect a multi-centennial institution to change its core quickly – somehow like riding an old horse doesn’t change its constitution and temper whereas the equestrian can and must nevertheless provide direction. It has even been considered one of the defining characteristic of HEIs to appear flexible at their margins in order to better protect and reproduce their core over many generations. If we consider the core of higher education to be a space for the rational pursuit of knowledge and the reflective development of creative and responsible inquiry not dominated by other societal domains like politics, religion and the economy, then, actually, it is not that bad that this cannot be changed easily. In this case we can be lucky that there is an immune system protecting academic freedom against ongoing assaults from many sides. If we consider the core of higher education as delivering degrees to those students most apt to follow through a ready-made disciplinary or pre-professional program and reproduce a fixed knowledge canon just-in-time on exams, then institutional inertia is indeed truly embarrassing in 2010.

I do not hold an idealistic vision of academic freedom in practice. Nevertheless, in great many cases, faculty has not only the possibility but the duty to pursue research and teaching according to what is deemed important and promising to them. There is an extremely individualistic bias to it reflecting a path Western cultures have had the tendency to go down more generally, a path still very much amplified by the specifics of the career ladder leading to professorships. Nowadays, this untouchable, individualistic academic freedom has suffered in many respects, especially through imposed frameworks for curricula like the modularization and learning outcomes hype, through formalized assessment, evaluation and accountability procedures, through more specific job descriptions, application guidelines and institutional development plans. But in the end, this might only appear as a new version of an old tension between the work of university administrators and the work of scholars. This tension is somehow part of the core of higher education as well. Putting aside its frequent Kafkaesque downsides and exaggerations, administrations of HEIs must be acknowledged to create relative stability and predictability and above all, they manage student enrolments, facilities and infrastructures, however they do this. All those who ever tried to build up their own infrastructure and administration know how much this diverts from the academic core business of research, teaching and service to society. So, basically, why not take advantage of the infrastructure (buildings, student administration, fundraising and degree granting reputation, access to physical and digital libraries, etc.) while not becoming sucked into its development and management?

The flexible margins sitting on this solid infrastructure concern the question what is researched and taught with whom to whom, when, where and why. As long as the basic interests of a HEI, or a department or institute are respected concerning student intake and success rates, academic reputation, acquisition of external funding, respect of equal application of formal rules regarding e.g. the teaching load etc., there is more than one possibility of running a program that can be (made) acceptable from an institutional and scientific perspective. The already mentioned trends toward more and stronger inter-institutional networks, toward strategic internationalisation, and toward pervasive utilisation of information and communication technologies are quite helpful. These trends are trickling into the core of HEIs – at least formally – and make the flexible margins of higher education even more flexible. On this basis the margins of and interfaces between (several) HEIs taken together can serve as the incubator for new HESPs based on ILAs.

From this double analysis, of conventional higher education and of alternative attempts, the following tentative *strategic corridor* can be derived:

- First focus: Building mutual awareness between the promoters of existing initiatives, and stimulating cross-cutting communication among them;
- Second focus: Creating mutual learning opportunities and enhancements between otherwise loosely coupled self-organising and self-maintaining small initiatives (e.g. by teaching each other’s students, writing in each other’s journals, devising criss-crossing team-teaching opportunities, engaging in smaller joint research and transformative practice projects etc.);
- Third focus: Intentional joint program development in trans-national multi-institutional consortia (second and third cycle, i.e. on the Masters and PhD levels, ideally thought together);

- Fourth focus: Creation of interfaces and overlaps between different programs from different consortia, weaving them together more and more (e.g. through joint virtual libraries, summer universities, mutually supportive research and intervention projects, and opportunities created for students to take courses from different programs).
- Fifth focus: Careful and flexible formal framing of the emergent requisite organisation for a series of HESPs based on ILAs which are distributed across several consortia, HEIs and countries (such an organisation would be largely a virtual overlay which leaves the host universities, their organisation and their conventional programs as they are).

The strategy proposed here starts with what is already there and doesn't worry about what is not there – according to the attitude of the Zen cook who is always able to cook a meal for the monks of his monastery on the basis of the ingredients available in the kitchen regardless which specific ingredients are actually available, have run out, or were never delivered. With this in mind, we can state that a whole bunch of tasty ingredients for the creation of HESPs based on ILAs is actually available in the "EHEA kitchen," and even more if we consider the intercontinental global scale:

- A truly amazing number and diversity of HEIs exposed to a more and more international and competitive field which imposes a strategic approach to differentiation and cooperation, and which is likely to stimulate some open-minded rectors(presidents), deans and heads of institutes to consider more integral options, at least on the program level, in order to assure the advantages of being a first mover for their institution;
- A critical mass of serious scholars and academic teachers in many disciplines and countries – serious according to mainstream criteria – who are already inspired by ILAs, a sufficient proportion of whom are intrinsically motivated to engage in the extra workload of building new programs;
- The courses they already teach which reflect a more or less integral flavour, or at least new ILA-based courses which they are basically able to teach after a short period of preparation;
- A critical mass of students wary of the programs on offer and eager to get a more ILA-based higher education (some consciously, some intuitively, and many who would discover their respective inclination if appropriate programs were on offer and could be compared to more traditional programs).
- At least some funding programs more departing from the (still dominant) traditional ways of funding and more tuned or at least open to innovative, transdisciplinary and collaborative approaches.
- Various experiences with more advanced (and challenging) forms of teaching courses in and for boundary-crossing settings: international/global, cross-domain, multilingual, collaborative, multi-level, blended (virtual / face-to-face) learning, bringing traditional and non-traditional students and teachers of various origins together.
- Various boundary-crossing scholarly discourses within and close to ILAs, and their fallout in journals, books, conferences and research projects.

Put like this one could say, perhaps not without a certain astonishment, that at this stage, i.e. right now, in the EHEA all the essential ingredients that are required to cook tasty meals called HESPs inspired by ILAs are already there: students, teachers, courses, HEIs, advanced boundary-crossing teaching and learning approaches, theoretical backgrounds, and some potential funds. Well, then, why the hell don't such new programs pop up all around us and be served on silver plates to the students queuing in front of the restaurant? This is quite evidently far from the case. So, what's the problem? *What is not working*, or who?

> *Well, the Zen cook … He doesn't cook. Why doesn't he cook? He is supposed to cook! Where is he? What is he doing instead? … He is looking for the magic k... The magic k? Yes, the magic k. He knows, the k must be there, in the kitchen. It was always there, but so rarely used that nobody missed it. His guess is that it might have fallen under the sink. He is looking there, but he has to tidy up the mess first. Just imagine! While the angry teachers are hungry, the students queuing, the funders looking for breakthrough ideas, the institutions running almost amok in a never-ending cycle of pseudo-reforms, our cook is calmly tidying up the mess under the sink in order to find the magic k - with a smile on his lips, of course. And indeed, after a while, in the midst of brushes, towels and soap, there is a piece of a page stripped from an old journal. It actually contains the magic k. The cook takes this piece of newspaper as if it was the most precious thing on earth and puts it carefully on the kitchen table. He adds it to the phrase that was in everybody's mouth: What is not working? Once the magic k is added, it now reads: What is knotworking?*

> "*Knotworking*" is a concept Yrjö Engeström has introduced to capture yet ill-understood emergent forms of collective intentionality and collaborative work departing considerably from the well-known traditional models of organisation, like face-to-face teams, markets, the governance hierarchies of bureaucracies, membership-based NGOs, or even circumscribable informal social networks. Knotworks have unprecedented, emergent characteristics that cannot be reduced to those of teams, organisations, networks, or networks of organisations or networks of networks upon which they build. According to Engeström knots are "*rapidly pulsating, distributed, and partially improvised orchestrations of collaborative performances between otherwise loosely connected actors and organizational units*." These performances can be extremely productive and innovative without any determinable and localisable centre of control or authority. "*The locus of initiative changes from moment to moment within a knotworking sequence*" brought about by "*interagency connections and reciprocations across boundaries*" that are "*focused on and circling around a complex object*." It is precisely the capacity to maintain and develop a shared even though shifting complex object – as for example HESPs inspired by ILAs – without any centre of control which makes knotworks different from formal organisations and informal networks in the generation and accomplishment of collaborative work. The readiness to loose rather than gain control, and the "*rejection and deviation from standard procedures and scripted norms are foundational to the success of such amoeba-like formations*." The new communication and information technologies play a catalytic role for this new type of collaborative work as does the individual cultivation of a specific kind of decentered awareness which allows the recognition of weak signs and complex patterns which would otherwise remain unattended or invisible. "*The efficacy and value lay in their distributed agency, their collective intentionality*." This distributed but focused collective intentionality can be considered an asset, a new kind of capital (beyond

> economic, symbolic and social capital). This distributed, "*collaborative intentionality capital*" [50] has not (yet) been grasped in its tremendous importance for collective value creation, collective innovation and transformative capacity by the more bounded and stable organisations and the mindsets sustaining them – and quite probably it cannot be grasped and used by them unless they become transformed themselves through the attempt to grasp and make use of it.

Knotworking between academic teachers, students, administrators, funders … across domains, languages and countries and across the entire range of ILAs is yet seriously and self-contradictorily underdeveloped by promoters of anything integral in academia, even though there are first upcoming attempts. Indeed, we need to put the ingredients together, otherwise nothing substantial happens, at least nothing making it up with the tremendous challenges and urgencies of our era. Without such *knotworking* across academic ILA communities the teachers and the students and the whole society will become more and more hungry and desperate in front of the larder which turns out to be actually … plain!

The first effect of *knotworking* is to discover that there are many more people interested or already engaged in developing a more integral higher education, and that waiting and preparing was good, but now time has come to act. This can help to redirect latent action potential and to disclose past experiences, current initiatives, and future plans and projects to each other. When this happens the second effect of *knotworking* can be to realize that one is not constantly in charge, but a whole, energizing field moving and moved by multiple actors in multiple places. This requires and allows us to become aware, moment by moment, of one's unique contribution to this field, and to deploy the right action (or non-action) in the right moment. This mindful awareness can be cultivated individually and collectively[51] and prevents loss of direction, motivation, and energy. It rather provides direction, motivation and energy. A third effect of such field-aware *knotworking* then can be the experience of being "plugged-in" more constantly, to "simply know" the movements of this field by one's whole multidimensional being, to wholeheartedly trust this flow and to follow its calling without delay. This can be very enthralling and re-enchanting, and contribute to attract additional actors resonating with a *knotworked* style of learning and working.

Conclusion

Most existing HEIs offer physical and digital infrastructures, values protecting a certain level of academic freedom (concerning research and teaching), degrees of a certain reputation, and flexible margins allowing at least some experimentation. The flexible margins of several HEIs taken together enhanced through state-of-the-art information and communication technology and diversity-proven andragogical approaches are even more flexible and … even more marginal. This marginality isn't negative at all. Being part of *and* being marginal to traditional HEIs at the same time is actually quite a good and appropriate "place" for the implementation of new HESPs inspired by ILAs beyond the traditional dichotomy of being inside *or* being outside. A layered, developmental strategy can help to move from isolated initiatives to mutual sharing to implementation of single programs to an intentionally interwoven ecology of programs inspired by ILAs. As people, organisational units and initiatives engaged in developing and implementing HESPs inspired by ILAs are quite loosely coupled, and will generally tend to stay loosely coupled to maintain their specifics, new approaches to cross-stream and cross-initiative collaboration are called for (in addition to new content, new educational approaches, and new contexts of implementation). It is suggested that the cultivation of knotworking awareness and capability is called for to take advantage of the already existing critical mass of scholars, students, courses, and research inspired by ILAs. This implies that the development and implementation of HESPs inspired by ILAs in the EHEA presupposes a well developed integral consciousness of the early promoters as much as the development and implementation of such programs is supposed to catalyze the emergence and stabilization of an integral consciousness in the participants.

---

[50] All quotes in italics are from Engeström (2005).

[51] Many practices are available to figure out and enact collective intentionality from a deep level connected to transpersonal fields of consciousness, like David Bohm's (Bohm, 1996) dialogue approach, Gerard Endenburg's (Endenburg, 1998) sociocracy, systemic constellations (Horn & Brick, 2005), Arnold and Amy Mindell's process work / world work (Arnold Mindell, 1995; Arnold Mindell & Amy Mindell, 2001), and Otto Scharmer's presencing (Scharmer, 2007; Senge, Scharmer, Jaworski, & Flowers, 2004), to name just a few.

Contours

> *In the coming century, there will be an urgent need for scholars who go beyond the isolated facts; who make connections across the disciplines; and who begin to discover a more coherent view of knowledge and a more integrated, more authentic view of life (Boyer, 1994, p. 118) … the academy must become a more vigorous partner in the search for answers to our most pressing social, civic, economic, and moral problems and must reaffirm its historic commitment to what I … call … the scholarship of engagement.* (Boyer, 1996, pp. 18-19)[52]

Based on the insights developed in the prior sections we can now attempt to tackle the core task which is to say something about the future of a more integral higher education in Europe. My attempt in this respect isn't magic for two reasons. The first is that the goal is not to predict but to enable such a future.[53] The second is the consideration that the future takes place already now, at least somewhere, and in some respects, and thus can be observed like other empirical objects. We can go even further saying that parts of our future took place in the past. That means that some future-enabling features were actually already implemented in the history of higher education and have then been weakened, supplanted or forgotten altogether. This doesn't mean to revive an imaginary golden age because there was no such golden age of higher education. But many ILAs converge in claiming that certain features from all former eras can be valorised and adapted to contemporary situations. At the same time these worldviews bring with them other features which have to be limited, contained, and transcended in the light of later cultural achievements and future requirements.

---

[52] For scholarship of engagement see as well Ven (2007). Ernest Boyer was Chancellor of the State University of New York, United States Commissioner of Education, and President of the Carnegie Foundation for the Advancement of Teaching, he received numerous awards and honorary doctorates.

[53] According to the famous phrase of the French writer and pilot Antoine de St. Exupéry who disappeared at the end of WW II: "Pour ce qui est de l'avenir, il ne s'agit pas de le prévoir, mais de le rendre possible."

In this perspective the attempt is made in the following sections to flesh out core features of early medieval, modern and postmodern higher education systems and to recompose and to go beyond them in an innovative integral vision of HESPs. This attempt is based on the material compiled in the tables in the appendix and helps to paint the contours of HESPs inspired by ILAs within the strategic corridor already specified. These contours are rather general and can be concretized in manifold specific ways. For accomplishing this task lenses frequently employed by ILAs are quite helpful, like individual developmental trajectories, cultural contexts and evolution, place, space and time, and the relationship between theory and practice. I will proceed stepwise and first spell out some *principles* required for ILA-based HESPs to be true to themselves, then address questions more specifically related to creating committed *learning communities*, and finally turn to *integral andragogical approaches* and *integral organisational development*. It will appear from the perspective of ILAs that community, andragogy and organisation are different angles of the same process concerning the same group of persons. This stands in contrast to the fragmented vision and practice in most of contemporary higher education in which these are different processes enacted by different groups of persons in different contexts.

Principles

A HESP inspired by ILAs, if it is meant to be coherent in the sense of practicing what is preached, must be designed along at least the following highly interconnected principles:

- *Scientific Quality Development*: Needless to say that in any HESP based on ILAs first and foremost the existing principles and quality criteria of academic research and higher education need to be respected and attained. The goal is not only to stick with existing standards, but to go beyond them and to develop and comply with standards derived from the broader views provided by ILAs, among which are the conscious attempt at raising awareness for, balancing, and mutually enhancing breadth *and* depth, individual excellence *and* collective intelligence, values *and* facts, theory *and* practice, micro- *and* macro-levels, the views of the history *and* of the future, first-order (empirical) *and* second-order (meta-studies) research, etc.[54]
- *Transformative Purpose and Commitment*: HESPs based on ILAs serve at least three higher intertwined purposes. They should contribute i) to substantially and immediately catalyze constructive transformation in society, ii) to serve as scalable showcases of higher education transcending (post)modern assumptions about and conditions for learning and iii) to support all the individuals involved (teachers, students and other stakeholders) in understanding and deploying their unique developmental trajectories according to their deeper vocation (Gidley, 2007; Glisczinski, 2007; Harvey & Knight,

---

[54] Little work on quality standards for integral research and integral higher education has been done so far. However, for the process of institutionalisation specific, explicit and more widely shared quality standards and quality development approaches including and transcending the traditional expectations are of crucial importance.

1996; Lessem & Schieffer, 2008; Maxwell, 2007; O'Connor, 2002; O'Sullivan, 2002; Reason & Torbert, 2001; Schugurensky, 2002; Weaver, 2008).

- *(Self-)critical Reflexivity:* The cultivation of constructive critique is considered as an integral part of individual and collective self-transformation. Accordingly, issues of contemporary local and global import and impact are addressed with critical reflexivity, as are in turn the worldviews, theories, models, methodologies, interpretations etc. used to address them. Targets for self-reflexivity and critique are the objectives, principles, roles, rules and regulations, standards and procedures of the study programs themselves, and the implication of students and teachers in their unique learning trajectories and their collaboration (Brockbank & McGill, 2007; Kenny, 2008; Moon, 2004; Schön, 1983; Tanaka, 2002).
- *Integral Pluralism and Dialogue*, i.e. a sustained attempt at the inclusion of a diversity of persons and perspectives in research, learning approach, organisation, and intervention etc.. Accordingly, such a study program can never be confined to a single paradigm, worldview or school of thought and is called to actively foster dialogues between different streams of ILAs and between ILAs and other paradigms, and between higher education and society. This should be cultivated with a scope which is creating and strengthening cross-cultural and cross-civilizational planetary dialogues (Dallmayr, 2010, 2003; Gidley, 2007; Giri, 2006; Molz & Edwards, 2010; Tanaka, 2002). A particular emphasis of dialogue, bridge-building and integration is necessary in our times to counterbalance the particularly strong institutional and intellectual forces of fragmentation (like nationalism, hyper-specialisation, extreme relativism, and the various reductionisms). Part of this principle is a deliberate approach for sharing, open access, and contribution to the global knowledge commons (Hess & Ostrom, 2006).
- *Organisational Learning and Participation*: Study programs based on ILA’s necessarily follow core tenets of organisational learning and of lifelong and lifewide learning of its stakeholders. The organisation has to be designed in all its aspects to stimulate and integrate feedback loops within and across organisational levels (individual, small and large group, community, organisational and inter-organisational), across domains (beyond education extending to politics, business, religion, civil society, the arts and the media etc.), and across layers of learning (from single-loop learning to triple or maybe one day quadruple-loop learning). This is only possible on the basis of strong approaches to participation and unleashing of collective intelligence and wisdom (Kenny, 2008; Kezar, 2005).

Integral Learning Communities

> *Building learning organizations, we are discovering, requires basic shifts in how we think and interact. The changes … penetrate to the bedrock assumptions and habits of our culture as a whole. We are also discovering that moving forward is an exercise in personal commitment and community building … nothing happens without “personal transformation.” And the only safe place to allow for this transformation of the self is a learning community. So, we are coming to see our efforts as building “communities of commitment.” Communities committed to create learning environments rather than follow recipes for success. Communities that embrace pragmatism and idealism, that address themselves to critical problems while sharing a vision as generators of rich lives rather*

> *than as ends in themselves. Communities that search for meaning and transcend their selves, their organizations, and their world.* (Kofman & Senge, 2001).

The constitution of intentional communities of learning, inquiry, practice and self-transformation inspired by ILAs depends on a sound answer to the questions who should be involved, how (which roles, rules, tasks and responsibilities), when, where and how long. Historically, higher education already underwent major transformations regarding these questions. At its very origins in Europe, the “universitas” was nothing else but (small, flexible, mobile, self-governed) communities of a teacher and his students, who spent quite amazing amounts of time together, somewhat like a family. In early medieval higher education it was common that a student choose his teacher, as this generally meant to engage in a longer-term interpersonal master-disciple relationship, and the participation in a specific community instead of another.

In modern higher education the student applies for a study program, and if (s)he is selected the respective teachers and fellow students are simply a given. Academic teachers on the other hand apply for jobs at HEIs and when they are selected in many cases they find themselves in a department with colleagues they never wanted to work with, and with students they are randomly flooded with. In some study programs selection of students is performed by a committee including the director of the program and perhaps some of the teachers. This allows for and even enforces some thoughts about student intake. In practice, however, more often than not, the selection procedure remains quite superficial, based on formal criteria or the usual game of application rhetoric. Scholars have generally little time to devote to the selection of their students, and students today generally select study programs and not teachers, with doctoral studies being partly an exception.

It comes as no surprise that under these conditions the traditional idea of a community of scholars and students based on intensive interpersonal relationships became more and more diluted and that in many places it is now completely lost. Students and academic teachers follow their respective duties, schedules, and trajectories, every student has many teachers, and every teacher great many students. The participants in different classes are not the same, courses are short, and there are many courses on different content to be attended within a week which is sliced up into pre-scheduled time slots.[55] This picture is quite characteristic for today’s mass higher education. Distance education providers allow for a more flexible organisation of time while often having pushed individualisation even further than campus universities. It can be questioned whether under these circumstances there is any collectively shared intentionality in a teacher / student group.

It should not be bypassed, though, that there are various attempts to revitalize the idea of learning communities. There is even a whole *learning communities movement* in educational research and practice (Gabelnick, 1990; Garrison & Vaughan, 2008; McNay, 2000; Wilson & Ryder, 1996). But first, this movement is not spreading widely, and second, under the structural conditions of mass higher education, individualisation, hyper-specialisation of scholars, and geographical mobility of everybody, the best intentions and the best practices can only have limited effects on restoring community for higher learning in the more original sense. The postmodern transition phase does not change anything to this state of affairs. The structural condition of modularization makes it even worse. At the same time the possibilities to create original new study programs are strengthened. If such a program is relatively small in size the creation of learning communities meriting this name become basically possible again, but it needs deliberate and sustained andragogical efforts to create and sustain them.

---

[55] They are following on each other, however, in a rhythm and in time slots which in many contemporary HEI’s are still modelled upon medieval monasteries!

Students

All this being said, how could ILAs respond to this history of weakened and suspended community and integrate suitable features from premodern, modern and postmodern practices? How could the undeniable advantages of actual learning communities[56] be reactivated under contemporary conditions? I want to make several suggestions regarding student intake and matching between students and teachers that are questioning deep-seated assumptions on which contemporary higher education is built (before addressing the questions how to keep a learning community going in the remaining sections on integral andragogies and integral organizations). I argue in favour of much more mutually *elective* than one-sided selective procedures reconnecting with the ease of access in the earliest phase of institutionalised higher education. But instead of students selecting a teacher or a study program, and the other way round, the constitution of more authentic learning communities might better be based on emergent transformative projects whose orientations are shared and co-shaped by those interested in them (see section on integral andragogies).

How could this happen? This depends on the type of program. From a developmental perspective I would argue for at least two types of study programs to be designed to adequately spread ILA's in theory and practice. The first type offers introduction into ILAs for students with little prior knowledge but interested in discovering the horizon of ILAs. The second type would be designed for students with more substantial prior knowledge and more arduous and focused transformative motivations. The first type of program can be framed by multi-year strategic transformative projects pursued by a team of researchers and practitioners as part of their practice-based research and research-based practice. Students could engage in such flexibly designed framework projects with a negotiated focus. In this case, the usual approach of individual applications could be used, based, however, on challenging, multidimensional, reflective tasks stretching beyond simple motivation letters. The set of selection criteria should be extended, give unusual profiles a chance, and focus on cross-boundary life trajectories (across disciplines, cultures, occupations, theory and practice etc.), the record of social engagement and spiritual practice.

Instead of simply fishing for the individuals best fitting to the criteria, a stimulating balance of diverse backgrounds within groups of students should be targeted. The attempted balance shouldn't be handled dogmatically as in formal diversity policies working with quotas.

---

[56] Small-scale communities were actually the adaptive unit 99% of the course of human evolutionary history. Accordingly, sociality and learning within group and community settings is not only part of our cultural but as well of our genetic heritage.

Nevertheless, in order to engage a broad array of experiences and perspectives a pragmatic mix is looked for between male and female students, students with different prior studies and levels of professional experience, students from different cultural and social class backgrounds, younger and elder students, students with and without family duties etc. Particularly lively and stimulating learning communities can unfold from such original mixtures. Such a micro-cosmos creates the requisite variety (Ashby, 1958) reflecting global human diversity with which transformative projects have to deal. Instead of separating traditional and non-traditional students into separate programs they can enrich and challenge each other within the same learning community if the respective learning pathways are properly framed, supported and crossed with each other.

The approach to the second type of program is more revolutionary because it intentionally breaks with the individualistic bias Western higher education is built upon from the bottom to the top. The undeniable merits of individual-centric education[57] notwithstanding, a more communal approach is called for in the future, an approach sensitive to individual uniqueness *and* to powerful collective action at the same time. For this to happen I want to launch the idea of *collective applications*. A collective application is an application submitted by a group of candidates who i) make claims on their shared interests, ii) suggest the contours of a transformative project they want to work on during the program, iii) explain the complementary roles they think they can play in this, iv) specify the resources, expertise and contexts they think they need to realize it, and v) those they bring to the picture themselves as a unique team. Once again, some framing conditions regarding diversity should apply. Much prior work must go into such a collective application. But this is already a very valuable learning process in itself, independently from its being taken up and realized by those who imagined it in the first place. The contention is that in the light of lifelong learning and in the light of ILAs more learning in more people can be induced by any single HESP than the learning of the selected students only between the start and end of the program's duration.

Accordingly, it could be imagined that the process of development of transformative projects by teams of students and others can and should be facilitated prior, during and after enrolment in an ILA-based HESP. This facilitation is a service to the ILA-communities and to society at large. Such a task doesn't come into the focus or is rejected by the limits of the strictly formally conceived responsibilities and by the clear-cut time frames from enrolment to graduation in which conventional higher education has become institutionalised. However, it is sure that such a reflective collaborative process of shaping the contours of a transformative project before even taking up a study program fosters reflexivity, unleashes creativity, helps to clarify individual vocation and collective needs. It can eradicate the widespread lack of enthusiasm of enrolled students for courses of a study program they have "chosen" in the first place. It makes students fully responsible for deciding what and with whom to learn and to work. It is an entrepreneurial activity involving risk-taking. It requires a vision and a passion.

---

[57] The individualistic bias goes almost untempered from individual applications for individual participation in mostly individual learning processes assessed on the basis of individual performance to achieve an individual degree opening up an individual career. Being practiced for ages this appears self-evident to many. However, there are alternatives which at least should be discussed.

Such an approach makes better use of the limited time of the teachers. A recurrent observation I have made is that otherwise a good deal of the duration of a study program goes into clarification of why students are actually there and what they actually want to learn and what they actually intend to do with what they learn. The matching between the (often vague) motivations of the students and the (often narrow) focus of a conventional program happen to be poor in many cases whereas time goes by until this becomes evident. In addition, the few possibilities for career counselling are often not used, and if they are used it often appears that their institutional separation from the actual dynamics of the study programs and of the work life isn't very conducive to induce better matches. Such a state of affairs produces unreasonably high drop-out rates as well as attitudes of following-through with minimal effort just to receive the degree. Often the main goal of attending classes at all becomes reduced to the desire to socialise with fellow students, and to end up with a degree. Just doing what is prescribed to get a degree is a dry, lifeless goal, bypassing the richness of the here and now which discloses itself in the light of passion, love and commitment.

It is clear that only a minority will appreciate the approach of collective applications and will be ready and capable to engage in such a demanding process. But this self-selection and mutual election is precisely intended when such a collective approach is launched. Web 2.0 tools provide very good possibilities today to help matching those often isolated students (and teachers) who actually share ILA-based interests, attitudes and commitments. If this facilitation of the matching is scaled up to the entire EHEA, or even worldwide, this is already creating community before anyone has enrolled in a study program. The catalyzing effort is small held against its longer term benefits. Through the (multi-step) procedure of collective applications less applications of higher quality have to be dealt with. Applications not retained at one point of time for one reason or another can mature further, merge with other ideas, be realized independently, or be taken up by somebody else. Opening up the possibility of collective applications as described can evolve into a fountain of fresh ideas and insights in their own right.

An advantage of such an approach is that it makes much clearer what students actually desire to study and to achieve (and force them in turn to be much clearer about this) while boiling down individual fancy to realistic collaborative projects. The collective applications retained then contain valuable indications which unique program to assemble to make it a good fit with the spelled-out expectations of a specific group of students and with the transformative needs of society. Instead of fitting students without evident shared concerns into more or less ready-made programs this means dynamically fitting programs to student teams who actually share concerns and commitments. Collective applications could even be conceived by students who pursue different goals and who are at different levels as long as they are convinced on the merits of the emerging co-created project. Masters students and PhD students and participants not interested in getting a degree (e.g. because they already have one or because they are happy with being a social entrepreneur) could apply together as long as they share a vision and a mission and can discover how their experiences, competencies and inclinations (e.g. more research-oriented and more practice-oriented) can complement each other and coalesce in a joint transformative project of learning, life and work.

Another innovative feature could be, back to the origins of Western higher education in this respect, to skip deadlines, and allow for applications any time. Administrative deadlines often prevent certain interested and interesting people to apply and projects to coalesce, because the rhythms from different contexts are kept separate or imposed and so prevented to supersede each other in more complex patterns. Especially in case of collective applications it cannot be predicted in advance when an application is ready to be submitted. This deadline-free approach would imply to allow for starting study programs more flexibly, according to actual needs and possibilities of an emerging learning community of students, teachers and other stakeholders. If the idea is to bring people inspired by ILAs and motivated to develop transformative projects together on a Paneuropean and global scale, this point is particularly important given that academic years, typical periods for exams and vacations etc. are not at all aligned across countries. For sure, administrations of HEIs won't necessarily accommodate to such a radical suggestion. If one doesn't want to permanently hit the limits of local time frames and their incompatibility with each other there is another good reason to guide our imagination toward a semi-autonomous overlay structure rather than a neat and total integration into any given HEI.

Facilitator

Now I want to focus on a key person in any learning community inspired by ILA's. It is the *coordinator* of the program. Dedicated coordinators for a specific HESP become more and more important in the complex, dynamic settings of postmodern higher education. They are complementing the traditional director of the program who oversees the academic quality and holds the institutional responsibility, and the secretary who is limited to administrative tasks. The coordinator dedicates most of her time to one specific program. Her task are i) guiding the students through the program from application to graduation and beyond (including alumni work), ii) providing access to resources, iii) administrating the online learning platform, iv) organising courses, events and assessment, and v) simulating quality assurance and quality development of the program. The need for a dedicated coordinator arises the more we are departing today from homogenous student groups following the quite stable, pre-established disciplinary curricula of modern higher education within a single HEI, and move to international student groups with different prior studies, to the many possible re-combinations of modularized and interdisciplinary curricula, and to cross-border consortia jointly sustaining a program. In the long run, success or failure of many of those more complex programs depend on having a dedicated, apt coordinator who has the overview and who holds everything together. The importance of such a position is still often grossly underscored.

HESPs based on ILAs are no exception to this new rule as they tend to go even further than postmodern HESPs with complexity, flexibility and heterogeneity, while demanding higher levels of coordination, coherence and integration. This implies that the coordinator is not only important but serves as a *key facilitator*. Accordingly, in addition to what a coordinator is already doing in a postmodern HESP, a facilitator in an ILA-based program must have knowledge about ILAs, and competencies in facilitation, individual counselling, team and organizational development, project management, public relations, intercultural communication, Web 2.0 tools and practice-based research. This rather impressive transdisciplinary profile being stated it becomes evident that such a position cannot be considered as an administrative position, nor as a position to be filled by recently graduated former students working on fixed-term contracts as it can be often observed. As it is the pivot of a HESP based on ILAs it should be seen as a full academic job opening up possibilities to evolve with research qualifications (e.g. through practice-based research into the development of the program). The facilitator is framing and supporting but not directing the work of the students and their negotiations with teachers, funders and supporters. If one day a further move along the strategic corridor (see section on Strategic Corridor) can be actualised, and ILA-inspired HESPs start to cooperate on a regular basis, a coordinator of the coordinators and facilitator of the facilitators may eventually be required. This position is the only additional investment ILA-based programs require in the long run compared to postmodern programs when they are mature enough to create a more integrated offer.

Teachers

When it comes to teachers, who are they, where are they, what are they doing and how do they join the learning community of the students and their facilitator? If a collective transformative project is at the core of the curriculum teaching fulfils a different function than in the additive curriculum content delivery model. Teaching then comes in at least the following four forms:

- As a set of core teachings agreed-upon to create common ground regarding ILAs. A few teachers holding positions in the HESPs of the consortium running the ILA-based HESP can commit together to deliver the core teachings. The possibilities to create fabulous cross-cultural, cross-disciplinary and cross-stream core teacher teams scale up considerably when it comes to a consortium of consortia (last strategic step). Teacher teams (and team-teaching) creates interesting learning opportunities among teachers. Students may join the classes these scholars run anyway, negotiate specific classes, or engage in one-to-one exchange on more specific topics.
- As timely support for the unfolding collective project (e.g. for a method, a tool, or some domain-specific knowledge) based on specific demands rather than on regular pre-scheduled classes. Additional teachers may indeed be contracted for shorter periods as guest lecturers. This is already common practice. But what is specific in the present suggestion is that the students would be in charge, supported by the facilitator, of choosing them, of negotiating content and conditions, and of evaluating their intervention.
- As support to develop the individual profile and personal key competencies. In this respect students can be encouraged and supported in finding the most suitable teachers for their individual development all over the place, the world being full of teachers. Most of them are delighted to be approached by highly intrinsically motivated students in a targeted manner within the range of their unique expertise as this doesn’t necessarily happen to them on a daily basis. A lot of teachers come into sight once the artificial limitation to faculty of the department running a program is falling: from young researchers to freelance researchers to retired professors, from artists to social activists to spiritual leaders, from entrepreneurs to consultants to policy makers.
- As peer-teaching between students, but as well of students teaching teachers, given the diversity of backgrounds, competences and prior knowledge.

It is evident that once more people are invited to teach on the basis of their passion, the teachers with institutional teaching roles can teach less and care more. This is an ongoing process which adaptively combines and takes advantage of the roles and positions of academic and other teachers corresponding to premodern, modern and postmodern times. This process properly framed takes into account that:

- Modern higher education systems systematically produce scholars for whom teaching is not high on the agenda. Their careers progress on the basis of research excellence and not on the basis of teaching excellence. The invitation to contribute to student's transformative research-based intervention projects is actually closer to research and to expert counselling than to traditional teaching and might be more appealing to senior researchers who can take part in those projects at a level of involvement of their choosing.
- Teaching excellence in the spirit of ILAs is yet rare and geographically quite distributed. Students actively searching for teachers can substantially contribute to make connections on a European and global scale. A database helps to keep track and to support the dynamics of net- and knotworking which then is likely to become self-accelerating.
- Interpersonal relationship building and networking across domains and age cohorts is becoming more and more important. This is much more than a nice add-on or a romantic return to the origins. Today, it is well established that social capital built over years is often more important than formal knowledge for professional trajectories across the fractures and ruptures of postmodern economies true to the potential of a person.

Conclusion

Learning communities are a particularly suitable and flexible form and context of learning which allows to build and strengthen self-consciousness, imagination, complex situated knowledge, social relations, collective intentionality and action, simultaneously. Students, teachers and all other stakeholders form committed and intentional integral communities of learning, inquiry, practice and self-transformation. The communities should be as multicultural, multilingual and transnational as possible, and include and consider all stakeholders regardless their formal status and position as researchers, teachers, students and practitioners. Integral learning communities are serious about student-centeredness.[58] Integral learning communities conceived and nurtured according to insights gained by ILAs support students along their unique pathways of learning and help them to find the most appropriate teachers in any moment. From such a broad perspective committed learning communities are self-extending and self-transcending. They serve a wider community. Accordingly, they show the same characteristics as light which has to be considered simultaneously as small and focused corpuscles and as distributed waves.

Integral Andragogies

> *The utilitarian model of the university now prevalent and the humanist model differ sharply both in their goals and their basic epistemic conceptions. While the prevalent model functions as a conglomerate of service-stations with no common educational aim, the humanist model reflects the educational aim of enhancing the process of self-design. While the prevalent model is based on the relativistic– positivistic view that existential and*

---

[58] Otherwise quite often reduced to a plastic word (Poerksen, 1995).

> *value issues are beyond the scope of scientific discussion, they are the very focus of the humanist model*. (Aviram, 1992a, p. 405).

As we have seen, the reflections on how to constitute committed learning communities in higher education is already tightly connected to core andragogical concerns and to the question how flexible or fixed in advance teaching / learning patterns and roles can and should be. Once again a look back into the deep history of higher education can help to understand the task to shape more integral andragogies today. In the context of this essay this will be necessarily a sketchy undertaking and leave many features out. The goal is not to expose a fully-fledge ILA-based andragogy for higher education – this needs to be a long-term collaborative effort drawing on a wide array of streams and cultural contexts[59] – but much more modestly and pragmatically to present some elements that hopefully prevent to fall into the trap to self-contradictorily deliver ILA-content in a conventional pedagogical mode. If this happens it is fatal because the medium is as much the message as the message and the hidden curriculum then forcefully counteracts and subverts the unique contributions ILAs can make to higher education, research, and societal transformation.

For the purpose at stake a meta-pedagogical perspective is adopted. Meta-pedagogical means that various pedagogical approaches, if properly arranged can be complementary rather than opposed to each other. A meta-pedagogical view can help to determine or devise pedagogical approaches that are integrating otherwise separate practices into more tightly connected, meaningful and sustainable learning processes. This means i) to consider *curriculum* rather as *co-designed process* than as pre-existing structure, ii) to put *vocation, wisdom and commitment* centre stage rather then shying away from even talking about these issues, iii) take the information technology revolution seriously and as a consequence switch to *resource-based demand-driven learner-managed learning*, and finally iv) to depart from the traditionally split relationship between teaching / learning and assessment and facilitate integrated approaches as in *portfolios* used for *collaborative project-based service learning*. Once again I propose to cross-connect these aspects with each other and to cycle daringly back and forth from the early Middle Ages to now and tomorrow.

Curriculum as Co-Designed Process

The curriculum in medieval higher education was almost completely fixed in advance. Learning occurred strictly on the basis of the scholastic method. This was very much a theoretical affair separated from mundane practical demands. This monk-like seclusion was surely necessary in the first place for the rise of an autonomous sphere of knowledge which then became pervasively, and often for understandable reasons, called the ivory tower. The ivory tower still exists today. However, postmodern societal conditions make stronger demands on higher education in respect to accountability, more immediate usefulness, and self-funding. Accordingly, the ivory tower gets more and more holes through private-public partnerships, transdisciplinary action research projects, non-traditional students, online delivery, service learning, the recognition of practice-based prior learning, and the like.

---

[59] There are first upcoming attempts in this direction (Gidley, 2010).

The separation of the young generation of future decision makers from actual practice for many years during their studies raises serious concerns in a time in which professional practices are evolving faster than curricula can be reformed.[60] The modern idea of higher education preparing for life and work once in early adulthood does not appear very suitable when change and rupture in career paths becomes the rule in a lifetime rather than the exception. The postmodern idea of preparing rather for change and uncertainty (Barnett, 2000) is something to be retained while lacking any particular focus. The focus can be provided by the emancipatory and transformational ethical commitment of ILAs. Some modern ideas of the university, especially as they have been rarely or only shallowly realized, merit reappraisal as well. As an example, the Humboldtian vision of higher education was about the unity of teaching / learning and research. It didn't only mean that the teachings should be informed by the teacher's scholarly research. Von Humboldt's humanistic understanding of research was much broader than the contemporary hyperspecialists' conception.[61] It didn't mean controlled laboratory research into exterior phenomena (however important they are). It was meant to be research broadly put, including one's own life and resulting in unique self-designed "experiments in living" (Aviram, 1992a).

Self-design requires opportunities for choice and participation on all levels regarding all determinants of the learning environment. Within the disciplinary curriculum of modern times the Humboldtian vision became actualised only in a very rudimentary and mutilated manner. Choice was reduced to minors and subdisciplinary specialisations. The current postmodern modularization hype undeniably brought about more possibilities for combining courses, but still the courses as such are generally givens mostly still inscribed in additive disciplinary and interdisciplinary curricula. However, endless possibilities for choice lay bare before us right now when leaving those historical limitations behind and considering everyone as a teacher, the entire world as the classroom, and the Internet as the textbook. This sounds unrealistic and revolutionary. But it isn't. Today, it is the perfectly realistic and realisable evolutionary next step andragogies based on ILAs need to explore as seriously and forcefully as they can.

Vocation, Wisdom and Commitment

This exploration requires an attentive navigating between Scylla and Charybdis. Scylla in this case are the restrictions inherited from an era in which strictly place- and institution-bound formal learning was adaptive because there weren't enough teachers nor enough pedagogical materials, restrictions, however, that have turned today into unreflected, self-reproducing, bureaucratic obstacles devoid of any defendable contemporary rationale (Aviram, 1992b). Charybdis in this case is the postmodern situation of endless consumerist choices which turn into arbitrariness, paralysis, loss of focus, sense and value. A third way can be found if we turn to a crucial perspective on higher education, taking the “higher” indeed very literally: the DIKUW holarchy in which *data* is transformed into *information*, *information* into knowledge, *knowledge* into imaginative and creative *understanding* and *understanding* eventually into *wisdom*, and the other way round when it comes to the enactment of wisdom (Ackoff, 1989; Maxwell, 2007). If we understand wisdom as the capacity to choose between or devise complex alternatives in an incorruptible commitment to what is good for the future of the whole, then it becomes evident that higher education cannot stop at producing data, disseminating information, conveying knowledge and facilitating understanding of the past. If already understanding cannot be taught but at best evocated, it is clear that wisdom cannot be learned like a subject matter. It can only grow by the sustained cultivation of a specific quality of individual and collective awareness enabling to “lead from the future as it emerges” (Scharmer, 2007).

---

[60] Under modernist institutional planning practices the start of the conception of a new study program (first and second cycle) is separated by roughly one decade from the first cohort of graduate students becoming operational in a field of practice. Until information from this field of practice is fed back and eventually taken up to substantially reform the curriculum and adapt it to actual requirements of professional practice it realistically takes another decade.

[61] Who are often taken to break up the unity of research and teaching because their research is generally too specialised to be taught right away before the third cycle.

Knowledge and understanding as educational goals can be transcended (and included) by at least two complementary moves that have to be carried out carefully around an inner space which cannot be touched and from which individual and collective creativity and wisdom can emerge: i) exploring individual *vocation* and ii) linking different vocations to each other in collaborative transformative projects intervening in a constructive and future-enabling manner in the ongoing societal macroshift. The notion of vocation has an interesting history downshifting its meaning or making it suspect, from the calling of the priest to modern “vocational training.” However, contrary to the (post)modern appearance vocation is not at all outdated. As a marvellous example, Frederick Buechner coined the famous phrase defining *vocation as the place where* “*your deep gladness meets the world’s deep need.*” Such an understanding of vocation transcends specific traditions, domains and age groups. It opens up a horizon of a potentially deep coherence between the individual and the collective beyond premodern social fixation, modernist career planning and postmodern patchwork nomadism.

Hence, a profound sense of vocation can be found in the 21st century. Talking and thinking about vocation, intuiting one’s vocation, laying it bare through collective care, and acting true to one’s vocation cannot be discarded from education. ILA-based andragogies are called to focus on vocation in this broad and deep sense. This makes their difference, their value, and their attraction. They need to develop multiple situated practices that are helpful for students and teachers alike to discover and stand to their vocation and unique contribution to collective endeavours, and the other way round to shape collective projects in a way which responds to the vocations of those contributing to them. This is an ongoing process not an achievement which can be made once and then fixed. By cultivating such a focus which was evacuated from most of modern mass higher education a strong sense of individual and shared purpose can unleash high levels of motivation and performance which can be sustained over long periods of time and across all kinds of challenges. As long as higher education is not touching this existential and motivational core of the human being it can barely be called higher either.

Resource-based Demand-driven Learner-managed Learning

As information represents a lower layer on the above mentioned holarchy, it is fundamental. In the very early medieval beginning of Western higher education the professor was lecturing from a book in reduced speed to allow his students to copy word by word what he said. This was an adaptive approach at that time as copies of books were too expensive for the average student.

As the curriculum was fixed and universal it was clear from the outset which books a student had to copy and to learn. This process, rooted in the constraints of a specific sociocultural and technological context, has institutionalised the plurisecular tradition of lecturing professors in higher education. Even though today lectures are not about reading a book aloud they are still pervasively given in higher education with much one-way communication. However, at least in the privileged countries, every student lives now in an extremely information-rich multimodal and multimedia environment of print and digital media. Lectures can be streamed or downloaded … or replaced by other sources of information without any problem. The contemporary problem is not the scarcity of information input but the exact opposite, i.e. information overload. The problem is not to produce one's own handwritten copy of authoritative books through hard labour of teachers and students, but to pave one's way through an endless, messy ocean of contradictory information any parts of which can be infinitely reproduced by the lazy movement of a finger in front of a computer screen. Under these conditions much well-founded knowledge is necessary to be able to determine the authoritative sources in the first place. This is somehow a vicious circle. A teacher can do this work and convey his/her synthesis of a domain to the students through a lecture, but then the students don't acquire the information literacy necessary to do this on their own.[62]

The entirely reversed situation concerning sources of information makes demand-driven learning more adaptive than the traditional delivery-driven education (Kirschner & Valcke, 1994). From an ILA-perspective this statement shouldn't be interpreted in absolute terms but in terms of the relative ratio between demand-driven and delivery-driven ingredients to one and the same learning process. If both ingredients are combined the delivery of input by teachers knowledgeable in certain domains can turn into suggestive stimulations. These stimulations tend to be better received and retained when they are less focused on sophisticated technicalities and more on providing orientation and overview that less expert people in a field cannot have. On the other hand, demand-driven learning requires unconditioning the passive habits developed through delivery-driven education pervasive in educational institutions which have not yet substantially transformed themselves to adapt to the contemporary information resource-rich environment. Demand-driven learning is very demanding – it demands inquiries into what one is looking for, i.e. it asks for learning about oneself – which brings us back to vocation, but at the same time about the community and the world, in multiple dynamically connected ways. It demands to develop and cultivate an attitude of continuous inquiry, of questioning, of paving one's way through the opaqueness of complexity by one's own efforts, intuitions and insights. It requires accepting not knowing, or even discovering not knowing as the source and natural environment of our islands of knowing.

The reintegration of inner dimensions into formal learning becomes inevitable on the basis of these insights. Even more so as today HEIs are loosing very much their exclusive aura of granting access to sophisticated knowledge. More and more open access digital resources of academic quality are available today and more and more universities adopt an open courseware policy making their course materials freely available over the Internet.[63] This means that there are ample opportunities to access and acquire academic knowledge without ever being enrolled in a HEI. As a consequence, in an age in which 24h per day broadband wireless Internet access is granted to students on the laptop campus and in great many other places the core concern of postmodern institutionalised higher education cannot be about information delivery any longer.[64] What actually remains from the traditional core of higher education are dedicated spaces for teacher – student and student – student interaction coupled with degree granting power. Open courseware doesn't deliver this core but just the fundament on which it is built. So let's focus on these interactions which are crucial for the learning of all those who are not auto-didactic heroes. The issue of degrees will be addressed later.

---

[62] Reflected in the well-known saying: "Give a man a fish, and you feed him for a day. Teach a man to fish, and you feed him for life."

Under the above-mentioned premises, much has already been said about the required change of the role of the academic teacher from "the sage on the stage to the guide on the side." But the old habits and scripts are deep-rooted on both sides, students and professors, and they are stabilized through the usual institutional inertia. As a consequence, the role expectations and practices regarding teaching and learning are evolving at a very slow pace in higher education. Typically, the age old blueprint is often still the dominant model. It consists of a conception of learning in three steps and settings clearly separated from each other: i) delivery-based teaching, ii) repetition and internalisation by the student, and iii) reproduction during final assessment. The standard script demands several smaller and larger cycles like this leading to a grade. In this respect there is continuity between early and modern forms of higher education.

Alternative ideas of student-centred, self-regulated if not learner-managed learning (Graves, 1994; Harrison, 2000; Ottewill, 2002; Wilcox, 1996; Zimmerman & Schunk, 2001) have not yet cracked this traditional version of a learning cycle at any larger scale. Many versions of these alternatives are themselves limited in practice in their actual student-centeredness or learner-directedness, as students called to learn under the conditions of implementations of such frameworks in actual HEIs rarely (co-)determine the whole set of parameters constituting their learning environment: when and at which pace to learn what and where with whom for which purpose, on the basis of which support and input, and when and how progress and outcomes are assessed. The usual institutional framings and understandings of student-centeredness generally allow certain limited moves but not others that would perhaps be more important for empowerment, participation, emancipation and self-transformation. The radical potential becomes right away domesticated (Taylor, Barr, & Steele, 2002).

Portfolios

However, many proponents of postmodern variants of higher education at least try to bring a different approach to the fore in which teaching, learning and assessment are better coordinated, or even more integrated, i.e. in which they are more coterminous and more continuous, and in which their co-determination is more critically reflected in dialogues between students and teachers. An integrative approach to catalyzing, reflecting and assessing learning at the same time is the portfolio. It was originally limited to the art faculties but is spreading impressively across all domains and levels of education as postmodern conditions and insights spread. A portfolio is assembled and developed by the student herself. A portfolio allows focusing on strengths, working on the presentation of one's work, and fostering self-reflection on one's learning processes. These features make portfolios coherent with student-centred learning and the development of unique profiles. It can also contain the work submitted to traditional assessments and its results and it can stretch beyond the end of formal education into professional life. This makes portfolios a very flexible tool for self-assessment, peer-assessment, and expert assessment at the same time.

---

[63] Inspired by the pathbreaking "open courseware initiative" started by the Massachusetts Institute of Technology (MIT) in 2001 with more and more material made accessible to the global public since 2002 (see http://ocw.mit.edu).

[64] The responsibility in this respect is shifting rather strongly to lifting the financial, technical and organisational access barriers to protected digital libraries, archives, databases and repositories.

There are many variants of portfolios and of ways to work with portfolios. There are interesting possibilities to extend and transform the work with portfolios through an ILA-informed perspective. One extension would be to de-compartmentalise process and outcomes and to fuse online working environments with electronic portfolios, reflecting different stages of advancement of different activities.[65] Another extension would be toward a seamless "plug-in" integration of individual portfolios with team portfolios (including extended project documentations) with learning community portfolios with the presentation of the HESP and eventually of the umbrella organisation. This would wipe out with one stroke the usual annoyance of students with assessment and of scholars with contributing to annual reports, quality assurance reports etc. because the activities and the material are already properly presented at the right place from the outset and no extra and double work is needed. These extensions, among others that should be imagined, require new technical (digital) solutions[66] and new multi-layered and integrated andragogical practices. To bring this transformation about it cannot be circumvented to break with some very deep-seated habits. One example is that because of the individualistic bias groups or teams have rarely been considered as learners in their own right in formal educational settings.[67] Even less considered up to now are the inter-level links between individual learning, team learning, community learning, organisational and inter-organisational learning, and the global macroshift. If andragogies sympathetic with or rooted in ILA's focus their work on these underdeveloped links, in theory and practice, they can make an appearance with an unprecedented profile and deliver pervasively useful contributions to research and society.

---

[65] As they advance naturally from idea, to plan, to draft, to final version, to evaluated final version.

[66] Attempts in this direction are just about to emerge (Meyer, Sporer, & Metscher, 2009; Sgouropoulou & Skiadelli, 2008; Wolf, 2001).

[67] Kasl (2001) is one of the very few exceptions. Even in many strands of so-called collaborative or cooperative learning the individualistic bias remains dominant when the collective setting is mainly considered as a means to serve individual learning better. One major objection against team learning in formal education is that the individual contribution cannot be properly assessed, but of course there are many possibilities to assess team work on individual and collective levels. In work settings the situation is totally different. There is abundant literature on team building, team development, high performance teams etc., and a lot of valid research focusing on the team level as such.

Collaborative Project-based Service Learning

Within these considerations collaborative project-based service learning taking advantage of the latest advances in information and communication technology should be a highly integrated and highly flexible merge of andragogical approaches that can be specified in many ways according to conditions and opportunities at hand in a given context (Butin, 2005; Thorley & Gregory, 1994). Up to now, project-based learning, collaborative learning, service-learning, and blended learning evolved as only very partially intersecting autonomous streams of pedagogical and andragogical research and practice. Informed by ILA-frameworks, there are very good reasons, however, to consider them as facets of one integrated core stream of learning in and for the 21st century rather than as different approaches to be employed for different target groups in different contexts and at different occasions (Rowland, 2002; Shneiderman, 1998; Visser, 2001).[68]

Project-based learning in its more simple forms probably goes back to practices developed in Italian Renaissance architectural schools, was reissued and revitalized in alternative education movements across continents during the last century or so, and is now more strongly re-entering higher education across domains, specifically in inter- and transdisciplinary settings. Accordingly, they suit particularly well to the cross-cutting issues ILAs are addressing. Learning through working on projects organically connects research-based practice and practice-based research, play and problem-solving,[69] history and future, creativity and discipline, first order (empirical and theoretical) research and second order (meta-level) reflection etc. It should be conceived as research-base practice and practice-based research. It is a self-designed learning activity producing multiple outcomes, among them tangible ones. Tangible outcomes are adding widely neglected assessment dimensions to self-, peer- and expert assessment, i.e. assessment by reality (what works, what doesn’t work?), and once the service-learning orientation is included, assessment by internal and external stakeholders (do they feel served appropriately?). If service learning is occurring in collaborative projects, e.g. in terms of co-operative inquiry (Heron, 1996) or cognates, the above mentioned cross-level integration from the individual to the community and beyond is sustained. An inquiry project-based approach, especially if it is an ILA-based multi-year endeavour of collective transformation reaching out beyond the confines of the initiating group, is integrating several metaphors of learning otherwise held and practiced separately (if at all): learning as knowledge acquisition, learning as participation, learning as knowledge building, learning as life journey, learning as emancipation. Accordingly, multiple forms of learning occur in such projects concerning all dimensions of the human being.

---

[68] I am working towards such integrated conceptions from different angles (see e.g. Duchastel & Molz, 2006; Molz, 2003; Molz & Bauchet, 2005, 2006; Molz & Gidley, 2008; Molz, 2010).

[69] There are actually three major types of problem-solving which are often at odds with each other as they pertain to different activity systems (i.e. different mixes of persons, communities, roles, tasks, goals, incentives, urgencies and outcomes): solving of research problems, solving of practical problems, and devising policies. An important task of ILA-based problem-solving then is to be aware of this (necessary) differentiation, and to focus on the activity of meta-level bridge-building between research, policy and practice. A more fruitful relationship between these domains is one of the most important unsolved problems to solve across scales (local, national and global) for the achievement of a sustainable planetary civilization.

As collaborative project-based learning rooted in ILA's do not rely on a single metaphor of learning at least four otherwise intractable problems of the traditionally additive and now modularized nature of the (post)modern curriculum can be overcome: i) the integration of knowledge across courses, ii) the unsustainable results of purely intellectual knowledge acquisition, iii) the inefficiency of the factory approach imposing everybody to learn the same content at the same time at the same pace, and iv) the development of key competencies. For the integration of knowledge across courses the student is usually very much left on his or her own. It is considered a personal sense-making endeavour, or not even considered at all. However, it is not sure whether it doesn't fail more often than not and result in a fragmented understanding leading to fragmented intentionality and action.[70] How could students possibly succeed with the titanic task of creating connections and coherence which their (subdiscipline-bound) teachers don't even try to tackle by themselves? Nor do many of the teachers attempt to provide at least directions and tools to advance their students on a path of boundary-crossing understanding that they do not follow themselves. The burden on the students is unreasonably heavy in this respect, and the one on the teachers unreasonably light. If projects are conducted a practical integration of different domains of knowledge is unavoidable. In ILA-based HESPs this must be reflected by theoretical integration as one of the domains and responsibilities contributed by the core teachers. At the same time innovative practices arising from the projects are challenging the models, theories and frameworks.

Evaluation

It appears that collaborative project-based service learning takes a lot of time. This is undeniably true. But time requirements can only be measured against actual outcomes, and the fact that students tend to spend more time on projects they have co-designed than on rereading lecture scripts if they have the choice means as well that they learn more, more intensively and with more motivation. For this reason it can be assumed that despite the time requirements of longer-term ILA-informed collaborative service learning projects they are likely to outperform other pedagogical approaches according to their own criteria. But they do not only enhance learning of those participating in them, they provide at the same time an immediate service to society. This needs to be considered as an additional evaluation criteria when calculating the invested time and the invested resources. The actual outcomes – all the outcomes – need of course to be evaluated empirically. But to prove the gain in effectiveness, efficiency and ethics of such a highly integrated approach to higher learning there need to be some implemented programs first that subscribe to this vision.

At this stage the argument goes as follows: the ultimate test of evaluation is neither performative evaluation nor summative evaluation (however necessary and helpful both can be to sustain and canalize learning processes), it is confirmatory evaluation. Confirmatory evaluation concerns the learning achievements which are stabilising over a substantial period of time (e.g. five years). Quite probably, little learning from usual higher education would passes the confirmatory evaluation benchmark.[71] It is much more likely that crucial insights linked to embodied experiences pass this test, experiences one simply never ever forgets again because they are saturated with passion, emotion, action, dialogue, co-being and –becoming,[72] whereas specific strands of expert knowledge acquired through lectures and other forms of purely intellectual transmission are easily forgotten after exams took place, and unfortunately often even before.[73]

---

[70] Isn't this the same state as at the beginning of the studies, but now graduated and probably proud of it … ?

If creativity, emancipation, wisdom and transformative practical impact rather than just "being knowledgeable about something" is the ultimate horizon for education, it might be difficult to design a test. However, the constant complex challenges related to collaborative project-based service learning make an individual's passion and competence as much apparent as her limits and shadows. Once again a supportive community can help to enhance strengths and to integrate shadows. This makes actual transformation as a process beyond knowledge acquisition more likely than a curriculum circling around nothing else than knowledge for the sake of knowledge from assignment to assessment. Project-based service learning doesn't prevent but enhances the adequate acquisition of more specific content knowledge. Being or becoming knowledgeable about many things is a condition and an outcome of project-based learning and work occurring in a learning environment open to the world if the projects are devoted to a worthwhile cause and deal with complex challenges.[74] Content-knowledge acquisition occurs on a continuous basis in the organic context of its use, i.e. linked to an exemplary understanding of what this or that piece of knowledge is actually good for.

The disadvantage from a modern perspective is that when running projects in learning communities you can't say in advance which knowledge is acquired, by whom, and when. Another recurrent critique is that sophisticated knowledge cannot be learned on the fly and just-in-time, but must be built up over some time to be available when it is needed. There is some truth to this, but the impact is limited in learning communities. As in postmodern pedagogical approaches it is welcomed rather than abhorred here that everybody acquires different skills and different sets of knowledge. In a project different complementary knowledges can and must be injected and shared once a situation asks for them. If everybody did the same thing a collaborative project would cease to be a collaborative project because as any complex collaborative activity its success depends on an adequate level of division of labour. Collaborative project-based service learning as the andragogical approach for the core curriculum doesn't rule out additional learning in individual, subgroup or large group settings occurring on more conventional instructional terms. Another critique is the free-rider problem.

---

[71] But this doesn't appear to the fragmented mind because none of the defenders of the "evaluation regime" are administering and nobody is passing such a confirmatory evaluation test. This only happens quite exceptionally for the fun of a specific TV show format.

[72] This old psychological and pedagogical insight became more recently very much corroborated by results of neuropsychological research.

[73] This contention doesn't imply that experts forget their expert knowledge, but makes a point which is akin to what Albert Einstein already said, namely that "imagination is more important than knowledge and that he "can never commit to memory anything that can easily be looked up in a book."

[74] Another of Einstein's famous phrases was: "Only one who devotes himself to a cause with his whole strength and soul can be a true master. For this reason mastery demands all of a person."

The free-rider problem is only a problem in short-term project teams, and much less in longer-term committed communities working towards a shared, intrinsically motivated goal. In such longer-term projects the free-rider problem, if it occurs, can be addressed by appropriate facilitation and reflection, including individual counselling.

Today, the development of transversal key competencies like presentational skills, team work, foreign languages, ICT literary, entrepreneurial initiative etc. etc. becomes ever more important (Fallows & Steven, 2000). Almost everybody agrees on this. But even many postmodern approaches do not manage to overcome modernist additive curriculum designs. The curious result is that they tend to simply add “key competence modules” to “disciplinary subject matter modules” in order to satisfy the requirement to develop key competencies. In doing so the requirement is only met in theory but not in practice, however, because adding further modules to an additive curriculum means i) either overburdening the students, or ii) skipping other modules, or iii) achieving lower levels of expertise development per domain, disciplinary *and* transversal. It is apparent that there isn’t any attractive alternative among these three options. A crucial reversal of all this occurs when projects are not considered any longer as an add-on to a traditional curriculum confined to a specific module in which one is supposed to learn everything about project management or team work for example in a short period of time,[75] but when they are considered as the core of the curriculum supported by more traditional add-ons (some particularly concerning the development of a conceptual understanding of ILAs helping to connect and integrate knowledge bits). Then all the transversal key competencies are exercised on a continuous basis, provided care is taking that teams have a diverse composition and that reflection on the experiences and their relating back to relevant theories and models is properly facilitated.

Conclusion

Integral andragogical approaches and curricula are co-designed, enacted and continuously adapted by the participants in the learning communities described in the section before. They are interacting with other relevant communities and individuals on the basis of multilateral negotiation and anticipatory learning. As the processes of learning are taking place in an information-rich, relationship-rich blended context they can be dominantly demand-driven. The core of the curriculum is constituted by variants of collaborative project-based service learning supplemented by more traditional learning formats. These projects presuppose the cultivation of a sense of vocation and the analysis of societal needs. While enacting their vision of the good in terms of experiments in living the student-managed project teams reunite teaching, learning, working, living and multiple forms of assessment.

Integral Organisations

> *In an important sense, the University has had to be a disintegrative institution, despite the persistence of holistic rhetorics. However, to meet the intense challenge of globalisation and to match the volatility of late-modern (or post-modern) society, higher education will*

---

[75] And forget about it again in the traditionally delivered disciplinary courses.

> *have to develop a new capacity not simply to build alliances with other institutions (in its own terms) but to reinvent, reengineer and re-enchant itself, to compromise its own integrity in order to allow a new configuration of 'knowledge' institutions to develop.* (Scott, 2000, pp. 9-10) [76]

At first sight, the implementation of such an andragogical vision informed, by ILAs and proposed to advance committed learning communities, doesn't seem to be realistic given the many intertwined constraints reigning in most contemporary HEIs. It is right that an appropriate organisation is difficult to realize because many requirements are at odds with pervasive practices and regulations within mainstream HEI's. My suggestion therefore was to settle on the margins, to dwell in the interstices, and to broaden them by linking them together across HEIs, domains and countries. Small interstices can be intentionally expanded into a *third place*. Realising a cross-border HESP can be based on the least common denominator and then result in a doubly, triply constrained space which is then on the verge to become uninhabitable. However, bringing several margins together in cross-border consortia can as well bear a more than additive result if it is guided by a strong vision. Then it becomes possible to make a specific use of the unnoticed unregulated zones, to be granted exceptions to rules, to invent innovative solutions resulting from border-crossing dialogues on the given constraints etc. Intentionally dwelling in the interstices (between disciplines, HEIs, countries) raises many organisational questions, among them those concerning i) languages and language policy, ii) infrastructure and support, iii) organisation and legal status, iv) degrees, v) quality and vi) funding. All these questions will be addressed in the remaining sections, following the already known procedure to look into history to better bounce into the future.

Regarding *languages* used in teaching the constitution of higher education as a system across political borders was possible in the Middle Ages on the basis of a lingua franca, Latin, as it is today again on the basis of another lingua franca, international English. During the intermediate "nation-state era" between those two "cross-border eras" national languages were institutionalised as the dominant and in most cases exclusive languages in use in higher education. This not only had the effect of closing down and reducing international scholarly communication (which never ceased, though), but it also provided a basis for a genuine development of the humanities and the social and educational sciences with characteristics tuned to specific cultural and institutional contexts which they reflect and from which they arise. The use of national languages in higher education was a conducive condition for democratizing access to higher education because completing post-secondary education didn't any longer depend on high levels of mastery of foreign languages.

In order to overcome the closure a series of bi-national cross-border programs were created in Europe in the last quarter of a century, actually working in the respective two national languages at the same time, some courses running in one, some courses in the other language. There are a few bilingual universities as well, but the language sections appear to be institutionally quite separate from each other in most cases.[77] More recently, there is a movement in Continental Europe departing from the originally quite strict use of the respective national language in higher education and implementing study programs running entirely in English. The goal is generally to attract more international students (which would otherwise go the UK and the USA for their convenience). Multilingual programs are a rare appearance so far, but there are some examples. Their language policies and practices are not at all homogeneous, but generally the set of official languages is fixed in advance.

---

[76] Sir Peter Scott serves as Vice-Chancellor of Kingston University in London, President of the Association of University Administrators, Chair of the Universities Association for Lifelong Learning etc.

On this basis what can be an ILA-based approach to language use in a transnational HESP? Neither the exclusive use of a national languages nor the exclusive use of international English do justice to the complexity of intercultural dialogues and cultural knowledges (popular and academic). Between small national languages and English as a lingua franca there are a dozen or so widely-spoken languages sometimes more suited for conversations depending on the actual foreign language competencies of those actually learning, working and living together. The innovation could be to delink language use in a HESP inspired by ILAs from rigid language policies and to become responsive to the possibilities and limits of written and oral communication in specific contexts, learning communities, project teams and teacher-student-dyads composed by members of different origins. It is quite sure that this opens up new possibilities in many situations, and allows to find creative solutions combining in new ways any language shared among at least two persons, any approach to mediation and translation, and any facilitating organisational tricks.

The next point concerns the material and digital *infrastructure* of higher education. Interestingly, in the very beginning of the “universitas” there was no material infrastructure at all besides the book the teacher brought with him to hold his lecture. Teacher and students met wherever facilities were available, or if there weren’t any the lectures took place in the street, or in the home of the teacher. The core was not the place or building but the student-teacher relationship and the teaching. However, step by step the “universitas” became rather identified with the buildings in which the teaching took place on a more regular basis rather than with the community of scholars and students. Universities started to own buildings on the basis of endowments. Today, some large universities are like a town within a town. They are made up of impressive campus sites with myriads of specialized buildings, lecture halls, libraries, labs, computer centres, sports facilities, halls of residence etc. A virtual overlay has been adding to all this in recent years. Courses, counselling, even sometimes exams can take place online. Digital media repositories, e-administration, learning management and online conferencing systems allow to “de-materialise” entire HEI’s which than appear as distance learning providers, or virtual universities. Many different mixed forms between material facilities allowing for face-to-face encounters and online learning platforms and tools have appeared. They are subsumed under the summary label of *blended learning*. Blended learning allows for more flexible arrangements regarding time and place. It combines the advantages of real people meeting real people in all dimensions, at least occasionally, and the tremendous advantages of what has been coined Web 2.0.

---

[77] With the notable exception of the trilingual University of Luxembourg where I am currently located and in which languages are not confined to sections.

Inter-institutional HESP's can much more easily flourish when developing their own "online home" in terms of a digital portal and virtual community platform, independently from the host universities. Today, this can be realized in a very flexible manner at amazingly little costs, especially since more and more powerful open source software has become available specifically for the needs of the academic knowledge worker and for collective distributed learning, research and project management. ILA-based HESPs would be crazy not to make use of the best of breed of digital tools and media in order to realize one or the other variant of a blended learning approach. In order to bring together those students and teachers within the EHEA and beyond who really share ILA-related interests and motivations the online portal of any blended learning program is more pivotal than the location to which somebody is bound by job, family, or other obligations on the one hand, and the location of a brick & mortar HEI on the other hand. What a student actually needs, at least as long as the focus of a program doesn't require heavy lab equipment, is access rather than place – access to protected or dedicated online resources like online courses, online meeting, discussion and co-writing spaces, online repositories, reference databases and full text digital journals. Something that needs to be created – and can created rather quickly under normal conditions – is an intelligent combination of access granted by the HESP to its dedicated virtual community site, and access to protected digital resources granted by the host universities' ordinary library and computer services.

Interestingly, on this technologically advanced basis it is possible to come back very much to the state of affairs reigning many hundreds of years ago when there were not many facilities at all. A permanent connection over the Internet being the baseline, the face-to-face meetings can be arranged wherever and whenever it is most convenient for those involved, according to their actual geographical distribution. For meetings the projects teams and communities can use the facilities of a partner HEI, but they are not restricted to this option. It must be said that many of the campus sites and buildings constructed in the second half of the 20th century are not of a particularly inspirational aesthetic quality. At the same time there are many very aesthetic and inspirational places which can host small-group gatherings. Some universities own specifically more remote facilities.[78] Some are run by hosts who are themselves inspired by ILAs. The gatherings can be scheduled as intensives; partners, friends and kids can be invited to travel with the participants and enjoy the site on holidays parallel to the meetings; meetings can be combined with interventions linked to the collaborative service learning projects and hosted by the practitioner-partners; participants who happen to be geographically close can create antennas, i.e. more permanent meeting places, etc. Many unconventional solutions appealing to unconventional people otherwise reluctant to engage in higher education (again) open up once we stop reasoning in terms of material infrastructures we have to use because they "are the university" – many more possibilities than we can imagine today. Overall, if the university is once again imagined and enacted as a specific community of teachers and students, on the basis of the advanced global ICT infrastructures, the participants can "meet continuously" regardless their physical location, and they can meet in the most convenient or the most inspiring locations, once in a while.

---

[78] The campus of the Arts, Health and Society Division of the European Graduate School in the Swiss mountains being an outstanding example (www.egsuniversity.ch).

To close this section on material infrastructures let me come back to alternative brick & mortar HEIs. If i) they come to exist, if ii) their leaders understand the overall strategic challenge described in this essay, and if iii) they are not completely absorbed by their own development processes, then they can serve as helpful co-initiators, primary hosts, test-beds, privileged locations for gatherings and strategic reflection. They can test models of how to best reconnect the domains of student affairs, academic staff development, curriculum design and infrastructures to each other and to higher purposes. They can show how a HEI can subscribe to organisational learning based on a participatory approach contrary to the zeitgeist.[79] And most important to the argument: they can strategically contribute to speed up the movement along the strategic corridor (see section on Strategic Corridors). This doesn't mean only giving but also receiving. If they become part of inter-institutional and international networks alternative HEIs can more easily broaden the array of study programs they can offer and they can gain access to additional sources of funding. They can gain reputation if these networks include conventional HEIs (even though the cooperation is not directly with the conventional HEIs but with the unconventional ILA-programs hosted in the interstices). Under normal conditions compared to conventional HEIs alternative HEIs will always be considered as less serious, less prestigious, less ancient, less this and that (and too esoteric, after all, as the stereotype goes). However they actually work, they are lost in the ranking race because the ranking criteria don't do justice to them, but nobody cares, and their faculty has a hard time moving back to conventional HEIs if they want to because they have been working on the wrong side of the divide. Given this prejudicial basis alternative HEIs don't generally have any immediate impact on the further development of conventional HEIs and the whole higher education system. They are already lucky when they are tolerated and when some day they get their programs accredited. As partners in consortia, however, at least the opportunity is created for conventional HEIs to learn from alternative HEIs and the other way round.

The emergence of HESPs inspired by ILAs as proposed in this essay is supposed to work with and without alternative HEIs connecting to this vision and strategy. Regarding a possibly emerging "consortium of HESP consortia" as ultimate step of maturation within the strategic corridor, an alternative HEI can suggest to assure the meta-coordination, but it can be assured as well by a lightweight independent organisation (see next topic below). According to the strategy espoused in this essay the need for such a central coordination and administration emerges only in the latest stage in the process. In contrast, when building a brick & mortar alternative HEI this need emerges right from the beginning. In that latter case the growing central administration must be continually sustained across fluctuating levels of funding and made adequate to a fluctuating number of students. If a crisis occurs and the administration has to be reduced the whole structure risks to become dysfunctional and break apart. In the former multi-layered and distributed case, however, the umbrella layer can be very small; a single position can already have the desired synergetic effect, and even in case this person ceases working the autonomous constituent programs can be kept running as before on the basis of their own organisational base and history. This characteristic is modelled upon evolutionary system dynamics and makes the suggested moves within strategic corridor (see section on strategic corridor for building integral higher education) much more robust and flexible than niche alternative HEIs can possibly be in Europe in the time to come.

---

[79] Paradoxically, there are many organisations of learning (schools, universities etc.) that aren't a learning organisations! The possibilities for participation have been further reduced with the introduction of the managerial university.

If it comes to the *organisational formalisation* of inter-institutional blended learning HESPs, at an early stage normally a relatively short cooperation agreement between the participating HEIs is generally sufficient. As this has become a common practice in the EHEA that is spreading more and more widely, there are many examples which can serve as a model. However, usually, it takes some time until each concerned central administration is ready to sign such an agreement. A good strategy is to start with any two partners who are ready and to expand the consortium once others are ready to join. In the meantime their representatives can contribute as teachers to the learning community as this doesn't require any specific inter-institutional agreement.

It is quite widespread that inter-institutional and international study programs give birth to a student and alumni association. Once we consider extending the goals of such associations and admitting teachers and other stakeholders as members such an association could actually serve as the organisational container for the integral learning community and for the maintenance of its "window" (the virtual community portal). If we consider that originally teachers and students were organised in guild-like self-governed corporations with everybody having a say, it is worth considering such study-program related associations as a means to come closer to this again, especially so as we have probably arrived at the historically lowest level of collective participation in the decision-making processes within HEIs.[80] On this basis it becomes clear that organisational development of HESPs rooted in ILAs is likely to be at odds with the usual organisational dynamics within mainstream HEIs – one reason more to decide to rather dwell in the interstices and to create a (lightweight) extra-layer which then can be more self-governed.

In case one day several ILA-based HESPs developed by different consortia or HEIs start to cross-connect and eventually want to establish a more formal organisation according to the next stage of the strategic corridor, European law offers a very suitable but little known legal status: the European Economic Interest Grouping (EEIG). The name is somehow misleading, though. The EEIG is not supposed to produce profits. It is just a legal entity for the coordination of shared interests of its members and for pooling resources and power to act. The idea is that different types of organisations, like associations, foundations, companies, universities, even individual freelancers from different European countries, can formally join under one umbrella structure to work for a common cause. The member organisations maintain their full autonomy while coordinating some of their activities with each other. Contrary to other legal entities the headquarter of an EEIG can be moved from one country to another according to arising requirements without need to refound the umbrella organisation. Another considerable advantage is that no capital is needed to found an EEIG, and it is relatively easy to set up from a formal perspective. It is an extremely flexible and adaptable legal status that is providing full rights of contracting with other legal entities. It can integrate any new member organisation interested in ILA-based higher education provided it is located within the European Union.[81] The point here is to show that from cooperation agreement to association to an EEIG-style umbrella organisation, levels, scope and intensity of coordination between individual and organisational actors can evolutionarily scale up sustained step by step by adequate organisational forms and legal entities. It is important to realise that besides the basic anchoring through an inter-institutional cooperation agreement which is a very usual procedure this can happen quite independently from the heavy organisational and bureaucratic mills inside HEIs in a smooth, self-determined and lightweight manner.

---

[80] The modern professorial university has reduced the opportunities for participation of the students, and the postmodern managerial university has even reduced the actual influence of the professors. So, why shouldn't students and professors wary of this situation experiment with other approaches to organisation and decision-making regarding the affairs of teaching, learning and research they are concerned by together? Most ILAs hold a genuinely participatory worldview while developing an understanding of the problems with both undifferentiated egalitarian and undifferentiated hierarchical models of decision-making. One way to deal with this tension is to grant decision-making and representation power as a function of genuine trust, of somebody's record of engagement with organisational development and of competence and experience related to specific areas, without emphasizing unnecessarily formal position- or status-related criteria as it is strongly the case within conventional HEIs. Approaches like sociocracy (Endenburg, 1998) can leverage collective intelligence and bring about more inclusive, more adaptive and more agile organisations.

Even in the final stage such an umbrella organisation would of course not have a *degree granting power* on its own. It could only issue "ILA-studies certificates" in addition to the degrees granted by the consortium running any single program, certificates which would need to make the proof of their value in the long run. This is not an unusual approach, though. Many consortia in many fields do this. The combination of a joint degree of traditional HEIs with a specific certificate from a higher education consortium testifying an ILA-based learning trajectory is likely to gain a better status and recognition than a single degree from an alternative HEI.

Together with its relative institutional autonomy the degree granting power is the single most important defining characteristic of the Western university. Until today a higher education degree generally has more prestige than other certificates of higher learning, despite the dramatic proliferation of degrees and degree holders. Originally there were identical degrees all over Europe, and they only served for admission to a teaching position at the university. They weren't a requirement to enter a profession or to be eligible to an institutional position outside of the university. Slowly they became an advantage in this respect, however, and eventually, with the modern university, an unconditional requirement. The unity of the degrees was destroyed with universities becoming integrated in national higher education systems, and with the tight disciplinary specialisation of study programs. The Bologna process has now structurally re-harmonized the degree levels, but the diversity still flourishes with a new wave of creativity concerning the development of new interdisciplinary study programs. The generalised diploma supplement is thought to reflect unique pathways within a common scheme. The diploma supplement is very useful for HESPs based on ILAs because of the absolute unique trajectories which are encouraged by them. The diploma supplement might even be extended according to ILA-based reflections.

---

[81] There are easy workarounds, though, for partners located elsewhere.

If in the USA higher education degrees in integral and transformative studies as such are issued, there are no such examples in Europe as far as I know. The question is whether generic degrees like this are helpful on the job market or otherwise useful. There are too few HEIs and research centres dedicated to ILAs and ILAs have no common identity and label. Accordingly, there is almost no specific job market for ILA-inspired scholars other than the one related to the discipline or field their work comes closest to. On the general job market unspecific degrees are generally disadvantageous compared to specific degrees (disciplinary or professional). A specific focus and a well-known denomination make it easier as well to get a HESP accredited in the first place. A domain-specific degree however doesn't reflect sufficiently the boundary-crossing ambition of ILAs. One solution is to combine well-known degrees with a specification, like integral health, transformative leadership or transdisciplinary sustainability, to take three existing examples. This might work best under the current conditions, but i) doesn't help with forging a common label allowing immediate cross-program recognition, and ii) doesn't do justice to those who are attracted to ILAs because they allow for study across disciplines and fields rather than to stay in the confines of the usual fragmentation of knowledge and practice. Overall, it appears that some thought has still to be invested to determine how to label degrees related to studies of ILAs in an adequate and promising way.

The worth of the degrees does not only depend on an adequate labelling but of course more basically on the *quality* of the study programs. There are paneuropean standards for quality assurance in higher education.[82] HESPs based on ILAs should strive to comply with them as soon and as well as possible. As these standards are of a very general nature this is not much of a burden if a program is well-designed from the outset. New programs should go through the accreditation process of one of the accreditation agencies listed in the official "European Quality Assurance Register for Higher Education."[83] Such an accreditation is based on a self-report, a site visit of a peer panel, and (in case of re-accreditation) student's course evaluations. The challenge is the same as with all ILA-based activities within an otherwise disciplinary landscape: uncertainties and problems can result from peer reviewers not being actual peers in respect to an authentic understanding of ILAs and of the andragogical and organisational approaches they require and pursue. In any event, from an ILA-perspective the accreditation is only the beginning and not the end of an ongoing quality development based on a participatory process. Care must be taken not to fall into the trap of separating external evaluation for the purpose of accountability, and internal evaluation for the purpose of improvement, a daunting split which too often turns the issue of quality assurance into a bureaucratic nightmare eating up precious resources which then cannot be devoted to the students any longer.[84]

The final question to be treated regarding organisational issues concerns the *funding* of such programs. No doubt, funding of innovative HESPs is not easy. My argument here was, however, that there is not more money necessary for HESPs following an ILA than in other postmodern programs relying on a coordinator. If such a program is hosted by a public university it can already start with the baseline funding, administrative support, facilities and access to digital resources provided for any other program. As already said, in Europe tuition fees cannot be that high and so other sources of funding are absolutely indispensable. An application to an adequate European funding program, like Erasmus Mundus,[85] should be attempted, as well as for a kick-off grant by a private foundation. Actually, all the traditional funding possibilities taken together are employed.

---

[82] European Standards and Guidelines for Quality Assurance in the European Higher Education Area (www.enqa.eu/files/BergenReport210205.pdf)

[83] www.eqar.eu

[84] For this systemic reason which cannot be seen, the fragmented responsibilities and practices in HEIs it happens, indeed, that the introduction of formal external quality assurance systems meant to improve quality are actually reducing the quality of teaching and learning.

In addition to this, a model originally invented to pay back scholarships is well worth a thought. In this model contracts are concluded at the beginning of the study program in which it is agreed, as a freely chosen engagement, that a small percentage of the future income of the graduate is returned to the study program on a regular basis (e.g. yearly) if the income exceeds a certain baseline. This model, once it is built up across a couple of student generations, can generate a constant flux of financial resources. If it is generalised, in the long run it institutionalises intergenerational solidarity (the established seniors helping the next generation to make their way), and makes such HESPs more viable and independent. Inviting students to contribute in ways which are not burdening them with debt is a good idea which can be even further developed. Let me introduce another example: PhD students who receive a scholarship can serve in return as scouts for detecting new opportunities to apply for scholarships for the next generation of PhD candidates. As a rule, the collaborative service learning projects should as well seize opportunities to achieve a certain level of self-funding after an initial phase. The spirit of social and knowledge entrepreneurship to be cultivated departs from the dominant three solutions of i) students taking advantage of but not appreciating tuition-free public higher education true to the phrase “what is free has no worth,” of ii) consumers who pay for (private) higher education as for any other service and expect an appropriate service in return, and of iii) those who pay high tuition fees without having the capital to do so, and who then pay back a loan to the bank for great many years after graduating. Instead of paying interests to a bank why not directly supporting future generations of students? A spirit coherent with ILAs is a caring one attempting to use available resources economically while expanding them through creative collaborative entrepreneurial activity rather than simply consuming them.

Conclusion

The organisational and regulatory (infra)structures should adapt to the needs of the learning communities they are supposed to serve – and not the other way round as it is often the case. The organisational framework for this must be particularly flexible to remain responsive to the learning communities and their projects, however they are shaped and distributed, and however they decide to work and evolve on the basis of their self-direction, self-governance and service-delivering project work. They should enable a blended learning approach, and help to sustain collective social entrepreneurship while responding appropriately to institutional requirements like quality assurance. It has been shown that appropriate legal entities exist for all levels of organisational unfolding along the strategic corridor, and that there are some innovative ways to tackle the hot issues of language diversity, decision-making and funding.

---

[85] See footnote 38.

Call

> *Sometimes it is easier to live with the comfort of despair than with the challenge of knowing that change can happen despite the inertia of organizations. But there is another avenue toward change: The way of the movement. I began to understand movements when I saw the simple fact that nothing would ever have changed if reformers had allowed themselves to be done in by organizational resistance. Many of us experience such resistance as checkmate to our hopes for change. But for a movement, resistance is merely the place where things begin. The movement mentality, far from being defeated by organizational resistance, takes energy from opposition. Opposition validates the audacious idea that change must come. … The genius of movements is paradoxical: They abandon the logic of organizations in order to gather the power necessary to rewrite the logic of organizations … What is the logic of a movement? How does a movement unfold and progress? I see four definable stages in the movements I have studied —stages that do not unfold as neatly as this list suggests, but often overlap and circle back on each other:*
>
> - *Isolated individuals decide to stop leading "divided lives."*
> - *These people discover each other and form groups for mutual support.*
> - *Empowered by community, they learn to translate "private problems" into public issues.*
> - *Alternative rewards emerge to sustain the movement's vision, which may force the conventional reward system to change.* (Palmer, 1992)[86]

This essay is a contribution to building collective intentionality directed towards a more connected, more strategic, and more integral process of creation of (more) higher education study programs inspired by integral and likeminded approaches, in the European higher education area and beyond. The overall suggestion is to question the recurrent focus on two organisational levels of strikingly little overall impact anytime soon: the creation of alternative higher education institutions and the transformation of the mainstream higher education system on the institutional level, and the introduction of ILA-based content on the course level. Without denying the value of successful attempts on these levels I am advocating a strategy concentrating on the crucial level of higher education study programs delivering degrees compatible with a broader labour. A strategic corridor was devised along developmental layers with each layer having its own value and autonomous functioning and additional layers adding further value. I tried to make plausible that much more higher education study programs based on integral and likeminded approaches could and should be created than can be observed so far given that the necessary conditions and resources are already available, albeit in a largely distributed and kaleidoscopic manner. In order to actually move along the developmental strategic corridor I have been stressing the crucial role of emergent knotworking as a practice of decentered awareness and coordination enabling the realization of collective intentionality in loosely coupled organisational settings.

---

[86] Parker Palmer abandoned his academic career he started with a PhD in sociology from Berkeley to become a freelance writer, activist and teacher. Many of his books were widely and enthusiastically received despite or because of the fact that their spirit runs counter dominant structures and practices of (higher) education. He became a Senior Associate of the American Association of Higher Education and a Senior Advisor to the Fetzer Institute. In 1998 a national survey of 10,000 administrators and faculty, named Palmer as one of the thirty “most influential senior leaders” in higher education and one of the ten key “agenda-setters.” In 2003, the American College Personnel Association named Palmer a “Diamond Honoree” for outstanding contributions to the field of student affairs. He received 10 honorary doctorates (source: Wikipedia).

On the one hand I tried to show that the contemporary European situation opens up fresh opportunities for advancing the cause of tertiary study programs inspired by integral and likeminded approaches. This situation is created by i) the global crises, ii) the Bologna process, iii) new European funding programs, iv) the diversity of national higher education laws and systems, and most of all of v) the development strategies of the myriads of higher education institutions operating under increasingly competitive conditions, conditions which are imposing the requirement on them to become truly distinctive and original. On the other hand I pointed at two types of obstacles which are preventing these opportunities from being seized to make higher education study programs inspired by integral and likeminded approaches a reality. The first type is structurally inscribed in higher education as it has evolved over the last century or more regarding its disciplinary lineages, its specialization bias, and the dogmatic prejudices of scientism. The second type is due to incoherencies in the various communities developing integral and likeminded approaches, especially the lack of interconnectedness, of common identity, and self-transcendence of integral and likeminded streams on the one hand, and of professional levels of complex strategic thinking, organisational development, and management practice on the other hand.

I have sketched possible paths to overcome these obstacles and envisioned the dawn of a new phase of higher education on the basis of interconnected programs espousing integral and likeminded approaches and overlaying existing higher education institutions and their traditional programs. This web of programs could be cultivated by several transnational consortia linked together by an emergent knotworked coordination which can later formalise as the need arises. My main contention in this essay is that only such a flexible and further expanding offer will respond to the vocation and uniqueness of students, teachers and staff already inspired by integral and likeminded approaches and by a concern for the contemporary transformations of self, nature and society. I tried to show how these inspirations can be expressed by fully embracing what is, i.e. taking realistically into account the institutional inertia and immune defence reactions of higher education systems and institutions as they stand today on the basis of their plurisecular heritage and the contemporary zeitgeist.

I argued that in this process integral and likeminded approaches shouldn’t limit themselves to add new content to existing study programs, but to invent different containers and processes true to their general principles and to the versions of andragogy they are bringing about. I have discussed how more integral ways to constitute learning communities on the basis of ethical and personal commitments could work and be adequately propelled through integral andragogies and integral approaches to organisational development. A particular concern was to show how these three major views of, or gateways to one single complex individual-collective subjective-objective transcultural and transdisciplinary process of learning, development and self-transformation could cohere and co-evolve.

As a matter of fact it can be observed that today there are vanguard study programs in which many of the innovative features mentioned in this essay are already implemented and practiced. However, they do not generally explicitly espouse an integral or likeminded approach nor do they convey respective content. At the same time there are other study programs conveying content related to integral and likeminded approaches but which do not necessarily yet put a more fully-fledged integral andragogy and integral organisation into practice. This observation might stimulate the desire to create coherence between community, curriculum and organisation in the spirit of integral and likeminded approaches. The vision I put forward is that the power and attraction of higher levels of coherence as usual between interacting persons, approaches to learning, organisational frameworks and societal needs can turn specifically designed and nurtured higher education study programs into inspiring, evolving centres of a “contaminating” transformative power for individuals, groups and larger collectives. I made clear that this requires to simultaneously depart from, transcend and overlay the given mindsets, infrastructures, rules and practices of (post)modern higher education.

The still largely implicit and outwardly fractured field from which this essay emerged calls for other contributions, responses, corrections and critiques, for alternative and complementary expressions, for new initiatives, for follow-ups, and above all, for action! It calls for knotworking between already existing initiatives, most of which are emergent and still invisible but for the most initiated of all those students, teachers, researchers, practitioners and policy makers already inspired by integral or likeminded approaches, or ready to become inspired. The call comes from nowhere in particular but it is there, it is undeniable, and the specific direction, expression and wording chosen in this essay shouldn’t hide that what is to be said and to be done is much more than what can be expressed or appropriately foreshadowed at this stage. It is sufficient, though, to amplify the early signs of the emergence of a movement which translates the “private problems” of isolated students and academic teachers who are inspired by integral and likeminded approaches and who are stopping to live “fragmented lives” into “public issues” and into andragogical and organisational innovation in higher education and society.

> *This revolution —intellectual, institutional and cultural— if it ever comes about, would be comparable in its long-term impact to that of the Renaissance, the scientific revolution, or the Enlightenment. The outcome would be traditions and institutions of learning rationally designed to help us acquire wisdom. There are a few scattered signs that this intellectual revolution, from knowledge to wisdom, is already under way. It will need, however, much wider cooperative support—from scientists, scholars, students, research councils, university administrators, vice chancellors, teachers, the media and the general public— if it is to become anything more than what it is at present, a fragmentary and often impotent movement of protest and opposition, often at odds with itself, exercising little influence on the main body of academic work. I can hardly imagine any more important work for anyone associated with academia than, in teaching, learning and research, to help promote this revolution.* (Maxwell, 2007, p. 113)

Appendix

The following tables reflecting aspects of the long-term evolution of Western higher education (12th-21st century) are focused on prototypes and tuned to the points made in this essay. It must be noted that they are truncated and warped: within-period homogeneity is grossly exaggerated, i.e. national traditions and differences between HEIs are not considered, the place of the recent and probably short postmodern transition period is likely to be overstated by providing it with a separate column whereas the late medieval/Renaissance transition period has been entirely omitted because it doesn't add much to the argumentation in this essay.

Table 1: Persons / roles involved in Western higher education across eras.

	Early Medieval Higher Education	**Modern Higher Education**	**Post-modern Higher Education**	**Integral Higher Education (scenario)**	
Students	Only (young, even very young) male students Socioeconomic and national background of no particular importance to access any university but self-selection of students because of the high fees (some scholarships were provided according to local opportunities) Conditions for admission: "mannered lifestyle," integration in one of the "nationes" (student communities) and one of the scholas (community around one teacher) Admission possible at any time Cross-border trajectories were easily possible	Transition from elite to mass higher education, but students from lower social class background under-represented despite the introduction of national scholarship systems considering socioeconomic criteria Female students catching up to parity but underrepresented on the doctoral level until today Admission upon formal application based on high school certificate or prior degree + admission test (in some programs and countries) Majority of students study one discipline in one university in one country Rather homogeneous student groups regarding nationality	Full mass higher education with some diversity and equal opportunity programs Lifelong learning becomes important Many more non-traditional students (practitioners returning to higher education etc.) Intake upon individual application according to program-based specifications Cross-disciplinary and cross-border trajectories become more frequent	Cross-boundary trajectories are required (across disciplines, cultures, occupations, theory-practice) Diversity sensitivity (non-dogmatic attempt to roughly balance within student groups male and female students, students with different social class background, students from different cultures, students with different levels of professional experience etc.) For individual admission balanced combination of criteria and combination of approaches Introduction of collective applications	If some continue to have the formal status as students, some as permanent or guest teachers, or as support

Teachers	Qualified through degree Hired by students (Bologna type) or by religious (Paris type) or royal authorities (Cambridge type) Teaching in different places was common Academic teachers were a rare species	Teachers are professors or those who are on the way to become a professor Professors are hired by a higher education institution on a permanent position and mostly teaching at this university There are many academic teachers	Permanent teachers hired by the higher education institution + guest teachers hired by the study programs Teachers teaching in different programs in different HEIs become more frequent There are great many academic teachers	All possible options combined according to arising needs and pragmatic possibilities Non-scholars are invited to the learning community (like artists, spiritual leaders, social activists, policy makers and other practitioners)	staff, all are actual students and teachers of other students and teachers. It is recognized that each member of the learning community has a specific profile of expertise and levels of development across all domains considered together
Support Staff	In the beginning almost none, later scribes etc., and caretakers, cooks etc. for running the colleges (which were just student residencies in the beginning)	University administration, secretaries, librarians, caretakers, cleaners …	Those of the modern university + IT & public relations specialists + student counselors & study program coordinators	Almost no additional support staff required compared to post-modern higher education, only coordinators of the network of consortia and programs	

Table 2. Approaches to teaching and learning in Western higher education across eras.

	Early Medieval Higher Education	**Modern Higher Education**	**Post-modern Higher Education**	**Integral Higher Education (scenario)**	
Curriculum	Fixed canonical curriculum centered on books and comments Same studium generale for all students (trivium - first cycle, quadrivium - second cycle) 3 different programs on the doctoral level (theology, law, medical studies) Long studies	Centered on disciplines and disciplinary knowledge Initial choice among disciplines (or professional programs) Few choices within disciplinary curriculum	Modular curriculum centered on competencies More choices across programs, higher education institutions, and countries Possibility to develop a unique profile Shorter studies	Centered on transformative projects informed by ILAs Intertwined pathways of learning on the individual, group & community level Great many choices (refocused according to vocation and societal needs during the macroshift) Students as co-designers of their curriculum seizing the opportunity to cultivate and develop their uniqueness	Tight and continuous integration of curriculum-planning,

Classes	Class with one main teacher (= schola) Classes are small Lectures, repetitions, disputations	Many classes with different teachers Classes are larger Mostly lectures, tutorials, seminars	Many classes with many different teachers Mix between national and international students Various types of classes and other learning activities	Project-based groups of students supported by one major facilitator learning together and individually according to negotiated pathways (attending classes or inviting teachers fitting to their pathway)	teaching/learning, research, assessment, practice and career development in multi-stakeholder collaborative learning processes
Pedagogical Approach	Uniform scholastic method Traditional tight interpersonal disciple-master relationship Mostly theoretical, largely separated from practice outside the university	Focus on conveying subdisciplinary content Mostly theoretical, in the branches preparing for the professions some contact with practice for advanced students (but often disconnected from the theoretical training)	Varied but non-coordinated pedagogical approaches and types of competencies actually developed Sometimes some reconnection between theory and practice (through fieldtrips, extended internships, service learning etc.)	Meta-pedagogical approach merging transformative, project-based, collaborative, blended, service learning, with all other pedagogical approaches according to arising needs, overall fostering innovation-oriented practice-based research and research-based practice	Continuous improvement and adaptation of the (meta-) pedagogical approach based on educational research, students' actual needs and reflection of collective experiences in the learning communities
Assessment	Disputatio (oral exam)	Assessment of courses (based on presentation, essay or test) Final thesis Final exams (oral or written)	Portfolio Continuous assessment (module-based exams, various assessment methods) Final thesis	Individual portfolio and continuous assessment of (ongoing) collective transformation projects through artful combinations of reality checks and self-, peer, expert & external stakeholder assessment	

Table 3: Structural features of Western higher education across eras.

	Early Medieval Higher Education	**Modern Higher Education**	**Post-modern Higher Education**	**Integral Higher Education (scenario)**	
Language(s)	Latin	National Languages	National Languages and / or English	Multilingual (diversity-sensitive and adaptive to particular situations)	
Infra-structure	Almost no dedicated infrastructure Classes took place flexibly were facilities were available There were only very few copies of books	Brick & mortar campus Library Research labs	Brick & mortar campus and/or virtual campus and access to protected online resources	Using existing brick & mortar and virtual infrastructures, adding own lightweight virtual infrastructures Meetings take place flexibly were facilities are suitable, and aesthetic (face-to-face & online, synchronously & asynchronously)	Study and research programs are developed and steered by various, flexibly developing transnational, transdisciplinary and inter-institutional consortia overlapping with each other as a loosely coupled knotwork sharing integral values and practices and jointly overlaying and making use of the (infra) structures of the (post)modern higher education institutions
Organi-sational Form & Legal Status	"Universitas" as guild-like association of students and teachers based on self-governance in which a substantial role was granted to the students	Public university status depending on the respective ministry of (higher) education or accredited private university status Self-governance of the professoriate with much less rights for the students	Various legal status (public or private university, foundation, company, company or grouping of public utility …) Managerial governance (regardless legal status) with little influence of teachers & students on central decision making	Flexible, trans-national umbrella organisations (e.g. EEIG) Self-governance of learning communities and the community of learning communities based on integral principles (e.g. sociocracy)	
Degrees	Degrees were identical & universally recognized in Europe, originally they served only as admission condition for teaching at the university, not for any of the professions	National degrees (which were not directly comparable) in many subject matters Degrees as mandatory entry requirements for professions and occupations	Transnational mutual recognition of degrees Structural harmonization (3-cycle model, ECTS) Diploma supplement Inflation of degrees	Ideally combination/ integration of existing and new (integral studies) degrees Integral extension of diploma supplement and competence frameworks	

Quality Control	Quality control steered by students (Bologna type) or authorities (other types)	Professoriate's self-control (or none in case self-control fails)	External quality assurance agencies - (re)accreditation based on site visits, institution's and study program's self-evaluation reports and students' course evaluations	Compliance with international quality assurance standards and procedures + continuous participatory quality development process engaging all stakeholders
Funding	Enrolment fees Tuition fees Exam fees Donations	State subsidies Enrolment fees Tuition fees (in some universities and in some countries) Donations/ own assets	Tuition fees State subsidies Competitive third party funds Donations/ own assets	All traditional options + intergenerational contributions from former students

Consciousness in Evolution
Sketch for a New Model – A Speculation

Donald F. Padelford

Abstract: It is hypothesized that hierarchically negentropic systems (defined herein), including organisms, are associated with partially non-local information/probability fields which, a) entail or express interiority, b) engender "entangled learning" with similar negentropic systems, and c) cause otherwise random processes, including mutation in biotic systems, to become somewhat non-random. These effects, which are believed to be driven by quantum interactions, modify those identified with the Modern Evolutionary Synthesis. A series of tenets, or broad organizing principles, related to such systems and their associated fields, are enumerated. An empirical test which could potentially falsify certain aspects of the hypothesis is given.

Key Words: Adaptive mutation, consciousness, directed mutation, entanglement, entropy, evolution, falsification, information / probability fields, interiority, natural philosophy, negentropy, non-locality, non-random, reductionism.

Introduction

2009 marks the 150th anniversary of the publication of Charles Darwin's *On the Origin of Species*, in which he formulated the proposition, now almost universally accepted among the scientifically literate, that natural selection, in conjunction with heritable variation and resource limitation, is the principal driver of evolution. When, during the early decades of the twentieth century, this proposition was combined with the work of Darwin's contemporary (albeit unknown to him), Gregor Mendel, the Modern Evolutionary Synthesis (MES, aka neo-Darwinism) was born, and has mostly triumphed ever since. The "nutshell" version of the MES is that evolution is a product of random mutation plus natural selection.

These mutations of course happen in the genes, which are discrete areas of DNA found in every cell in one's body, and are passed along to the next generation via gametes (egg and sperm cells). Francis Crick was co-discoverer of the spiral nature of the DNA molecule (the famous double helix), and won the Nobel Prize for this in 1962. Sometime during the next decade he showed up at a men's club my dad belonged to and gave a little speech which started out with the statement, "You are all machines." Towards the end of his life he expanded this into what he called "the astounding hypothesis:"

> You, your joy, your sorrow, your memories, your ambition, your personal identity and your free will are in fact no more than the behavior of a vast assembly of nerve cells and their associated molecules. (Crick, 1994, p. 3)

Of course, as a machine, your "free will" is entirely notional.

SOME RIGHTS RESERVED

This is pretty much the state of play in academic biology, with its underlying scaffolding of evolutionary theory, today. Depressing, but if it's true, it's true, and we've just got to live with it. But is it true? The thesis of this paper is that there is another model of evolution which better accounts for the facts at hand, and that, thankfully, is less depressing. One might even go so far as to say it's hopeful. To the neo-Darwinian proposition that evolution consists exclusively of random mutation in gametes plus natural selection, the new model of evolution sketched out here adds, "Except that organisms create information/probability fields (IP fields) which both convey heritable information directly to progeny, and which have the effect of causing otherwise random events, including mutations, to become somewhat non-random." There's a lot more to it than this, but that's a start.

It has become common in conferences convened to look at the Big Questions, such as *What is consciousness?* or *What does science have to say to religion?*, to invite both scientists and philosophers. The scientists provide a "reality check" and the philosophers provide what might be called an "assumption check." In other words, they are trained to ferret out assumptions that people, including scientists, may not know they are making, as well as to draw logical inferences between disparate fields of thought. So I would like to start in this introduction with a little philosophy, namely parts of the philosophy underlying science as it is currently defined and practiced. The remainder of this essay (a) introduces and discusses the tenets and argument supporting the new model of evolution sketched here, (b) suggests the resulting picture, (c) offers my hypothesis, (d) discusses relationships with the work of Kauffman and Thompson, (e) and, with that ground prepared, presents the model.

The most basic assumption underlying orthodox science is that the stuff of the universe is, well, stuff. It may be quarks, or super-strings, or something else, but it is something, some unit of matter and/or energy and/or space-time or something (some thing). This stuff then somehow combined and somewhere around 14 billion years after the Big Bang produced consciousness. The so-called "hard problem" of consciousness studies is *How does it do this?* That it does it, that matter/energy produces "your joy, your sorrow, your memories, your ambition, your personal identity" is not at issue. Whether it's via a "vast assembly of nerve cells" (Crick), or a 40 hertz collapse of quantum waves in the micro-tubules within those nerve cells (Stuart Hameroff) or something else – however it happens, the general idea is that you start with matter/energy and end up with consciousness. To most contemporary researchers this is so obvious that it doesn't rate a second glance. But it is exactly these "doesn't rate a second glance" issues that rate not just a second glance, but a good, hard second, or even third, look. It is exactly these issues that constitute our underlying assumptions and need to be put on the table, since if they are faulty, then everything that follows from them is also faulty, or at least incomplete.

Ken Wilber, an American philosopher, in his lengthy book, "Sex, Ecology, Spirituality," has an amusing example of a "doesn't rate a second glance" from a previous era, a popular "refutation" of Galileo's discovery of the moons of Jupiter:

> There are seven windows given to animals in the domicile of the head, through which the air is admitted to the tabernacle of the body, to enlighten, to warm and to nourish it. What are those parts of the microcosm? Two nostrils, two eyes, two ears, and a mouth. So in the heavens, as in the macrocosmos, there are two favorable stars, two unpropitious, two

> luminaries, and Mercury undecided and indifferent. From this and many other similarities in nature, such as seven metals, etc., which it were tedious to enumerate, we gather that the number of planets is necessarily seven. (Wilber, 1995, p. 387)

Today we would say that this is kind of crazy, but to our forbearers it was just common sense. It's certainly possible that a few hundred years hence our descendents will look at the universe-as-machine model we have constructed with the same kind of bemused incredulity. In any event for the present I merely want to point out that this basic assumption—the stuff of the universe is stuff—has not been shared by a very long-standing tradition of both Eastern contemplation and Western mysticism, including some prominent practitioners of quantum physics. Within these traditions the basic stuff of the universe is not stuff, but rather consciousness, or mind:

> There is no matter as such. All matter originates and exists only by virtue of a force… We must assume behind this force the existence of a conscious and intelligent mind. This mind is the matrix of all matter.
>
> – Max Planck

> The universe begins to look more like a great thought than a great machine.
>
> – Sir James Jeans

This tradition, that of Idealism and its cousins, runs counter to our contemporary "common sense" view that the universe is made up of matter (or matter/energy). While it is off the main path of argument here, I would like to note one thing in passing. Namely "Mind creates the universe" is a nearly identical statement to "In the beginning God created heaven and earth." Especially if God is consciousness.

Also in passing: Any universe we know, or can know, has a knower, an observer in it. Any fully objective universe, one which has no such an observer and therefore is devoid of subjectivity, while it may (or may have) exist (existed) is purely conjectural. And if consciousness is to any extent non-local, to be explained later, then this condition is impossible. Rerunning Descartes' query, *What can we know for absolute certain?*, the contemporary answer, it seems to me, is *Consciousness of stuff exists*. So the universe we know has a conscious observer, and we know that this observer has observer affects via quantum physics (on which more later). Therefore the known universe is, in part, subjective. What we see is partly an effect of our seeing it. And even if that part may be a very small one, it also may, via the "butterfly effect," leverage up into macroscopic effects of real consequence, or even (as we will touch on later) have calibrated the parameters of the pre Big Bang universe in such a way as to allow organized matter, life, and consciousness, to have come into existence in the first place.

But that's getting way ahead of the story. Returning to our narrative, starting with Galileo, the thrust of science has been to construct a model, a predictive model, of a non-theistic universe, which is to say one devoid of the supernatural and of "magical thinking." How do things work? And no need for any frig'n ghosts (or Ghost) in the machine either. Which brings us back to the assumption that matter/energy creates consciousness. As a starting point, I want to question that assumption. In particular, I want to explicate a dual approach in which matter/energy affects consciousness, and consciousness affects matter/energy (and without trying to decide which is the ultimate "top dog"—a largely futile task) in somewhat the same sense that matter can be converted to energy and vice versa. I think that there is plenty of evidence that this dual view better fits the facts. I would even go so far as to say that the way orthodox science has dealt with some inconvenient data is to simply ignore (or suppress) it. Those familiar with the philosopher of science, Thomas Kuhn, will recognize this as a well-worn pattern: if the data do not fit the reigning paradigm, dump data in the river. Those with longer historical memories will recognize that this was also exactly how the (Catholic) Church initially dealt with the early empiricists, albeit the Church admittedly had tools of persuasion that are thankfully unavailable to the reductionist orthodoxy of today.

Any speculation, such as detailed here, about the nature of reality, is by definition a thought experiment. But what kind of thought experiment? Clearly the model espoused here is not a work of science in the modern sense since I am, in part, questioning an assumption of science as it is currently defined ("the stuff of the universe …"). On the other hand, neither is it a work of philosophy because I will point out at least one place where implications of the model could be tested, and potentially falsified. Falsification is the bedrock of science. If a statement can be found to be potentially wrong via experiment or empirical observation, then it is a scientific statement. If not, not (Popper). It is true, of course, that the concept of falsification cannot itself be falsified, but I won't pursue that particular conundrum any further here. (This simply shows that empiricism is based on non-empirical assumptions, as is any system of thought.) It may also be true that a strict adherence to falsification is "honored more in the breach than the observance." If falsifiability is the "gold standard," then most science is conducted on the silver or bronze standard (with a bit of tin thrown in now and then). Scientists are people. People are known to advance their views through politics, through ridicule of the opposition, through intimidation and the like. None of these less-than-admirable behaviors are foreign to the scientific community. Still, at the end of the day – sometimes in the middle of the day but other times at a minute or two to midnight – the better approximation to truth will out. That is the virtue of science. Unlike philosophy it has a referee, and his name is Falsifiability. On the other hand, to the extent that an assumption is an absolute one, it cannot be disproved, and therefore belongs more to metaphysics than to science (Collingwood as cited in Castell, 1963). This is the case whether that absolute assumption is *The stuff of the universe is stuff* or *The stuff of the universe is the awareness of stuff*. One may fit the facts better, but neither can, strictly speaking, be ruled out (disproved, falsified).

So, if not science (at least in the hardest sense of that term) and not exactly philosophy (since aspects of it are falsifiable), what exactly is it that I am presenting here? I am inclined to hearken back to an earlier term, *natural philosophy*, to classify what I'm up to, albeit certain reviewers have objected to this characterization, preferring the more general term, "integral theory." A third possible term is speculative science. However characterized, though, the argument remains the same. I chose the term natural philosophy because the tenets enumerated in the model of evolution to be laid out here fall somewhere in the twilight realm of falsification: Certain implications can be tested and potentially proved wrong (if they are wrong). Others can't be. And unlike the situation that was addressed by the Michelson-Morley Experiment, which, at least in hindsight, definitively ruled out the existence of the "luminiferous ether" through which light was assumed to be transmitted similarly to a wave being transmitted through water, there is unlikely to be a test that definitively rules out the orthodox model or the model presented here (though the work of Harvard biologist John Cairns, to be explained later, may possibly come close). Rather, new data will tend to better fit either the orthodox model, the model presented here, or some as-yet-unknown third alternative. Let the chips fall where they may.

Tenets of a New Model of Evolution

What follows are twenty tenets, broad organizing principles, of the model. These are the model's bare bones, which I will subsequently flesh out a bit. In reading these one should bear in mind that, per hypothesis, they operate via the information/probability (IP) field effect, mentioned earlier.

1. Evolution is a phenomenon that takes place in hierarchically negentropic systems in general, and in life forms in particular.

2. Hierarchically negentropic systems are negentropic systems made up of, or constituted from, negentropic sub-systems, which themselves are made up of negentropic sub-sub-systems, etc.

3. Hierarchically negentropic systems are characterized by interiority.

4. Interiority is that aspect of hierarchically negentropic systems which, if concentrated sufficiently, results in consciousness.

5. Thus matter does not create consciousness. Rather highly evolved hierarchically negentropic systems (i.e., advanced life forms) manifest consciousness.

6. The tendency of hierarchically negentropic systems to become more negentropic, with more layers of hierarchy over time constitutes evolution as seen from "outside."

7. As seen from "inside," interiority seeks to increase itself, which is to say, to become conscious, or more conscious.

8. Interiority is, to some extent, non-local.

9. In particular similar (or identical) hierarchically negentropic systems share a degree of interiority. This is the view from "inside" such systems.

10. The view from "outside" is that hierarchically negentropic systems probabilistically tend to adopt, or conform to, solutions found or chanced upon by similar systems.

11. The partial non-locality of hierarchically negentropic systems exists in terms of both time and space.

12. The deeper the hierarchy in hierarchically negentropic systems, the more non-locality is evident.

13. Lower levels of the hierarchy in hierarchically negentropic systems have causal effects on higher levels and vice versa.

14. Also, causal effects operate from exterior to interior and interior to exterior.

15. As reductionism only fully recognizes the former effects (lower to higher and exterior to interior), it is wrong, or at least incomplete.

16. Idealism, while not a major force in today's world, makes the opposite mistake.

17. Up-to-down and in-to-out causality are, to some extent, the same thing, since systems with deeper levels of hierarchical negentropy embody greater degrees of interiority.

18. Likewise down-to-up causality is, to some extent, the same thing as out-to-in causality.

19. Taken to its logical end point, the ultimate hierarchically negentropic system would theoretically be totally non-local as to time and space and share an interiority common to all such systems lower in the hierarchy, including all life forms. The overlap between such an ultimate hierarchically negentropic system and what the religiously inclined call "God" is reasonably evident.

20. Because life continues to evolve, such an ultimate hierarchically negentropic system would logically also continue to evolve.

The Argument

Before launching off on an examination of these tenets I should probably state the nature of my argument. What I am attempting to do is to weave together the findings of various researchers such as Robert Jahn, Dean Radin, Rupert Sheldrake, Johnjoe McFadden and others, and apply my synthesis of these findings to the subject of evolution. Except where I express reservations, I accept their findings as valid. Those readers who want to make their own determination about such validity will need to study the work of these researchers as I don't spend any time in persuasion or in countering critics, who are definitely out there. Those readers who have read and are unpersuaded by the work of these researchers are likewise unlikely to be persuaded by my analysis.

Some thinkers who, either by implication or explicitly, do not generally accept the finding of the above researchers, and to whom I situate the theory here in contrast, include the philosophers Evan Thompson, John Searle, and Dan Dennett, as well as the scientists Stuart Kauffman and Richard Dawkins. My disagreement with these gentlemen varies from partial to near-total as the narrative will disclose. The essay includes a section detailing my divergence from Kauffman and Thompson.

I should state that the tenets listed here exhibit considerable overlap with those of Ken Wilber (1995) in his *Sex, Ecology, Spirituality*, mentioned earlier (hereinafter "SES"), which in their turn exhibit much overlap with similar "canons" laid out by Arthur Koestler (1968) in his book, *The Ghost in the Machine*. One major difference is that Wilber’s unit of analysis is the “holon,” which, following Koestler who coined the term, he defines as anything which is simultaneously a whole and a part of a whole. So for instance a word is a whole thing, which is made up of phonemes (or letters), sub-holons, and which is, or can be, part of sentences, super-holons. However, words don’t resist entropy (explained below). The term I have coined, “hierarchically negentropic systems” would be equivalent to Wilber’s physical holons (except to say that they are only physical would be misleading, as I trust will become evident). The biologist, Rupert Sheldrake, also uses the word holon in his work, but confines it to physical holons. So Sheldrake’s holon is largely equivalent to my hierarchically negentropic system.

Discussion

Now let’s take the tenets one or two at a time.

1. *Evolution is a phenomenon that takes place in hierarchically negentropic systems in general, and in life forms in particular.*

2. *Hierarchically negentropic systems are negentropic systems made up of, or constituted from, negentropic sub-systems, which themselves are made up of negentropic sub-sub-systems, etc.*

The subject is evolution both in biotic (living) and in pre-biotic systems. (To some extent humanity could be considered to have created a “post-biotic” world, a major theme of Wilber’s work, but not of this paper.) An example of the former is a cell. An example of the latter is a molecule. These systems are “negentropic” meaning that they resist entropy. Entropy is, roughly speaking, disorder. An example is a sugar cube put in a glass of water. Over time, the sugar dissolves into the water. But the opposite process is not seen: a glass of sugar-water will never spontaneously form a sugar cube. (Another example is your kid’s bedroom after he or she has had a “play date” with a friend.) Entropy is an expression of the second law of thermodynamics, which states that the universe is inexorably “winding down,” leading in time to its eventual “heat death.” Fun guys, scientists.

Negentropy is the opposite process. It is the “winding up” of certain systems. For instance, a whirlpool may be considered negentropic in that it spontaneously expresses order. No claim is made here that negentropy matches or exceeds entropy on the macro scale. Generally scientists believe that it is the other way around, that whatever negentropy may occur is more than made up for by increased entropy elsewhere, with the result that total entropy always increases. I am not challenging that belief, and I don’t express an opinion, one way or the other, as to its general validity. I would note in passing that it is incompatible with certain cosmologies, such as that in which the universe has no beginning or end, but this is not a paper on cosmology.

(Note to physicists re use of the term entropy, and thus negentropy. In the sense used here a royal straight flush is more negentropic than a hand with two of a kind. As I understand it, this is a function of information entropy vs. its thermodynamic cousin. Obviously the physical temperature of the cards is irrelevant to this use of the term. So, yes, I am more or less equating entropy with disorder, as do many (but not all) the researchers I cite, although sometimes their use appears to be ambiguous. If you are disapprobative of this use of the term, please feel free to insert the word *disorder* for *entropy*. The main thrust of the argument will not be materially altered thereby.)

However, the example I just gave, that of a whirlpool, is not the kind of negentropic system I am talking about here. What I am talking about is a negentropic system that is made up of negentropic sub-systems, which themselves are made up of negentropic sub-sub-systems, etc (with an undefined lower boundary). For this reason I use the term *hierarchically negentropic systems*. For example a molecule is made up of atoms, which are made up of sub-atomic particles (neutrons, protons, elections), which are made up of more basic components of matter (quarks or whatever), until, perhaps, we end up with super-strings. Which is as far as we've gotten so far. (Actually further, since no one knows whether super-strings even exist.) The claim, which I believe is non-controversial, is that these entities (e.g., molecules or atoms) tend to maintain their order, their negentropy. (Uranium spontaneously decays, which could be characterized as maintaining its negentropy less well than other, more stable, elements.)

The further claim, also believed to be relatively non-controversial, at least within the scientifically-informed world, is that evolution is not limited to the realm of what are generally seen as living systems, but also takes place in the pre-biotic realm as well. Since nearly everyone who accepts the scientific worldview agrees that life emerged from the pre-biotic, this is almost by definition true (although the mechanisms of evolution could differ). Also it is difficult or impossible to say exactly where living processes end and non-living process start. Is a virus alive? Hard to say. Another perspective on this is that following the Big Bang only very simple particles existed, then the first and simplest atoms, hydrogen and helium, and then, over time, more complex atoms formed in the center of large stars, until still later molecules were created from those atoms. The general thrust here is that, whatever the level of total entropy in the universe, there is at least a sub-section of it that is going in the opposite direction, towards greater complexity and greater negentropy. The hierarchical nature of this process, e.g., first atoms then molecules, is also evident. In SES Wilber points out a simple test as to what is higher or lower. If a higher holon were to cease to exist, the lower level holons would continue, but not vice versa. So if, somehow, molecules were wiped out, atoms would remain, but not vice versa. Likewise if humanity were to destroy itself, that would not be the end of life on earth. But if all life on earth were to end, that would also be the end of humanity.

One final thing on these first two tenets. Because what I am describing is *hierarchically* negentropic systems, in the biotic realm I am following the lead of the biologist Johnjoe McFadden, in stating that these are not dissipative systems, which he characterizes as "order from disorder" (McFadden, 2000, p. 136). The example given above of a whirlpool is an example of such a dissipative system, "driven by the random motion of billions of particles." Rather I am focused on *hierarchically* negentropic systems, "order from order" (Schrödinger's term in McFadden, p.137). A great deal of the scientific establishment believes that life is exactly a dissipative system. (This is conjoined to the view that "downward causation" is actually "systems causation," as with the whirlpool example. See Thompson, 2007, p. 426). The claim here is to the contrary since, to repeat, a dissipative system is negentropic but not hierarchically negentropic. Clear?

3. *Hierarchically negentropic systems are characterized by interiority.*

4. *Interiority is that aspect of hierarchically negentropic systems which, if concentrated sufficiently, results in consciousness.*

Here I am departing decisively from scientifically orthodox thinking (assumptions), not to mention "common sense" (but remember Wilber's example of medieval "common sense" about the correspondence of human orifices with the number of planets). However, common sense is a somewhat selectively applied notion. At a conference on the conflict between (orthodox) science and religion (*Beyond Belief, 2006*, viewable on the web) the assembled chuckled at the story of a petroleum geologist who in his professional capacity obviously understood that the precursor materials for oil deposits were laid down hundreds of millions of years ago, but who in his private life believed that life was put on earth 6,000 years ago. These same assembled did not, however, seem to find any contradiction (or humor) between their idea that, as reductionists, they purportedly have no free will, and their idea that they "should" spread scientific thinking. "Should"? Either your garage door opener works or it doesn't. You don't tell it what it "should" do. Should implies choice, and reductionists (sophistic arguments of certain philosophers to the contrary notwithstanding) don't believe that choice, and free will, exist. Like the geologist, they believe in contradictory propositions, each of which is "common sense," at least in their world.

Tenet 4 is, of course, simply a definition tying consciousness to something else, interiority. In both tenets I am saying that as we go from "deeper" hierarchically negentropic (HN) systems, ones with more hierarchical layers, to shallower ones, interiority likewise gets shallower, but, and here is the break, it never totally disappears. (While I haven't read him, I understand that this mirrors Whitehead.) This may not be too controversial if we limit ourselves to the upper layers of HN systems. Humans are, of course, conscious and even self-conscious. For instance we can contemplate our death or what someone else may think of us, how they're wrong, and just who do they think they are anyway? Nearly everyone likewise agrees that companion animals such as cats and dogs are also conscious, but of course not in as deep a way. Your dog may loathe (or love) the neighbor dog, but he doesn't think, *Who does he think he is anyway?*

Exactly how far down the phylogenetic table one wants to ascribe consciousness varies from person to person. Descartes notoriously excluded all non-humans. Most people, no doubt, see mammals as conscious, but what about birds? If birds are conscious, what about insects? *Et cetera.* The point is that one can probably draw the line on consciousness wherever they want, though only a true pan-psychic would believe that a simple molecule has it. (And research indicates that our brains are aware of many things of which we are not conscious, for instance under conditions of so-called "blind sight" – Google it). But as far as "interiority" goes, it's a lot like life. Just as there is no clear line between "life" and "not life" (is a virus alive?), so there is no clear line between "exhibits interiority" and "doesn't exhibit interiority." That's the claim anyway.

The way I (attempt to) establish this claim, as will become evident below, is that clearly conscious "systems," such as people or rats, show similar learning, and particularly non-local or entangled learning (to be described later) as clearly non-conscious systems, such as molecules ("clearly" to all but pan-psychists). It is possible, of course, that two different mechanisms that appear identical, one mechanism for systems with interiority and one for systems without it, are at work. But, borrowing Mr. Achem's Razor (also known as Occam) for a moment, I would assert that one system is preferable to two seemingly identical ones. Especially when, to repeat, finding the line between "has interiority" and "doesn't have interiority" seems as arbitrary as "alive" and "not alive."

Another approach to this issue is to see it in terms of evolutionary selection. Just as detection of light must exist in cells in order for evolution to gradually select for better and better "light detectors," which eventually end up as eyes, so if evolution selects for awareness/consciousness, that is, if it has survival (negentropy) value, then it must exist in the most rudimentary life forms (and even in "dead" matter if evolution extends to the pre-biotic as almost all scientists believe) in order for evolution to work on it.

5. *Thus matter doesn't create consciousness. Rather highly evolved hierarchically negentropic systems (i.e., advanced life forms) manifest consciousness.*

This is a conclusion from the prior two tenets. As stated previously, this conclusion throws the so-called "hard problem" of consciousness studies *How does matter create consciousness?* out the window. Answer: it doesn't. Rather hierarchically negentropic systems and interiority are the same thing seen from two different perspectives, "outside" vs. "inside." (Although, as touched on later, it is conceivable that "artificial interiority" may be achievable in quantum computers, and computers are not hierarchically negentropic systems.)

This does not mean that a pencil, *qua* pencil, has interiority, let alone consciousness. The reason is that a pencil is not a hierarchically negentropic system. In fact it's not even a negentropic system since it doesn't resist entropy. To review: an atom, a cell, a plant, an animal, are all HN systems. So the atoms in the pencil are hierarchically negentropic systems, but the pencil itself is not. How about dead plants or animals? When an animal is first killed, or a plant growing in the ground is cut down, its cells will continue to grow and divide, or at least some of them will. So, for the time being, while the organism is dead, these cells are alive as active HN systems. When the cells die, then their atoms remain hierarchically negentropic system, but the cells themselves do not.

The idea that consciousness is "baked in" to the universe was explored by Paul Davies (2007) in his book, *Cosmic Jackpot*, which is subtitled *Why Our Universe is Just Right for Life*. If any of a number of parameters were just slightly different, a universe that permits life, and therefore consciousness, would never have developed. And others have also made this point:

> … the density of the universe at the start … had to be fixed with an accuracy of around 10^{-60}. That is to say, if one figure after sixty zeros had been different, then the universe would be barren. There would be no life, no consciousness, and no you and me to discuss it. This astonishing precision is analogous to the dexterity of an archer hitting a one-centimeter-square target placed 15 billion light-years away, at the other end of the observable universe!

– *The Quantum and the Lotus*
Matthieu Richard and Trinh Xuan Thuan (2001, p. 41);

also see *Just Six Numbers: The Deep Forces that Shape the Universe*, Martin Rees (1999)

Needless to say, the conventionally religious take this fact as support for their beliefs. For his part, after running through a list of the various possible explanations, Davies ends (albeit somewhat half-heartedly) with the possibility that consciousness itself creates the conditions under which consciousness could arise. In this view consciousness is in some way outside time and acts on or shapes matter to "fix" the parameters so that they are favorable for life, and therefore consciousness, arising. The model presented here is consistent with, but does not require, this cosmology (which I personally like). However one difference between this model and Davies' view is that he, similarly to Stuart Kauffman, has an "emergent" view of life and consciousness in that he believes, for instance, that the cell is a machine (Davies, 2007, p. 224), whereas I am saying that a cell, or even a molecule, embodies some degree of interiority, no matter how slight, and that machines, not being hierarchically negentropic systems, do not.

6. *The tendency of hierarchically negentropic systems to become more negentropic, with more layers of hierarchy, over time constitutes evolution as seen from "outside."*

7. *As seen from "inside," interiority seeks to increase itself, which is to say, to become conscious, or more conscious.*

Tenet 6 is a definition of evolution that, among academics anyway, is a bit archaic, although it represents the layman's understanding of the term, and it is also pretty much how Darwin (1859/1964, p. 489) saw things: "And as natural selection works solely by and for the good of each being, all corporal and mental endowments will tend to progress towards perfection." Under neo-Darwinism, though, evolution doesn't really have a direction. This is because, per the Modern Evolutionary Synthesis (MES), the creative mechanism that produces the "design space" from which natural selection chooses, is randomness in the form of random mutation. And randomness obviously doesn't have a direction. It is not teleological, which is to say it has no goal. And in the orthodox view, neither does natural selection have a goal. Whatever reproduces itself, reproduces itself. End of story. Thus most academics would say that if, due to varying food supplies, Darwin Finches with stout beaks have more young (because the stout-beaked don't starve) than the slender-beaked (which do starve), that this is evolution at work. And if in the following years the slender-beaked have more young, taking us back to where we started in the first place, that this is also evolution. Exactly this back and forth process was involved in perhaps the most famous example of "evolution," that of moths becoming darker, because more difficult to see by their predators, during Victorian England when coal use was at its height and thus surfaces were sooty, and then becoming lighter in subsequent decades as coal burning lessened (or at least became cleaner).

By contrast, the popular view, and the one adopted here, is that when you go from slime mold to monkeys, or, extending things further, from Big Bang to Bach, that's evolution. And going from light colored moths to dark colored ones and then back again isn't. In part this is definitional, but the result of this definition is that evolution does have a direction. Namely towards more layers of negentropy, and greater interiority. Of course the simpler negentropic systems (including simpler life forms) don't all disappear (albeit many go extinct). The appearance of molecules does not spell the end of atoms. Viruses continue to prosper. And Darwin Finches may merrily vary the shape of their beaks back and forth over time.

In my view, these dual tenets deal more adequately (or less inadequately) with the issue of increasing negentropism or more complexity. The neo-Darwinian view on this is that it's all a matter of natural selection. (I guess if all you've got is a hammer, everything looks like a nail.) But while the process of natural selection may be enough to account for better eyes evolving from worse ones, it's not clear that complexity (not to mention interiority) in itself has any survival value at all. In the event of a full-scale nuclear war, it's reasonably clear that bacteria, unlike people, would survive, as they apparently have as hitch-hikers on moon probes:

> Bacteria of the species Streptococcus mitis were inadvertently sent to the moon in the unmanned Surveyor III in 1967 and were "rescued" still alive [dormant – dfp] two years later by the crew of Apollo 12 who brought back Surveyor's TV camera. The organism had been subjected to very low pressure [to say the least!] and temperatures of minus 100 degrees Celsius. [= -148 Fahrenheit] (Milton, 1997, p. 217.)

If your only goal in life is to replicate, which is the MES view, then you're probably better off being a bacteria, or even a virus, than a mammal. In contrast, the view here is that a drive to escape entropy is "baked in" to hierarchically negentropic systems, and perhaps the universe itself. In which case it's better to be a mammal.

Tenet 7, interiority seeks to increase itself, of course, is totally beyond the pale as far as orthodox researchers are concerned, but I think it more or less follows from the previous tenets. If there is a "felt sense" of interiority within all hierarchically negentropic systems, then almost by definition, negentropy "feels good" however one might want to interpret or think about the term "feel" if we are talking about, for example, a molecule. Everyone (using that pronoun in the very widest sense) likes to feel good. And one drop of water dripped in the Pacific Ocean creates a wave, even if a very small one, that can go from California to Japan and back again. So you don't have to be a big wave to be a wave (don't have to be an advanced hierarchically negentropic system to have a level of interiority). Of course if there is no interiority in HN systems below some level, which is the emergent view, then we are faced with the "hard problem" of consciousness all over again, except this time we have to figure out how matter/energy creates proto-consciousness, or interiority. At the risk of repeating myself, I simply feel it is simpler, more economical ("achem-onomical") to posit one system as seen from the "inside" and "outside," rather than two totally different ones.

The emergent view is that of, for instance, the philosopher (I would even call him a practitioner of natural philosophy) Daniel Dennett in his book, *Darwin's Dangerous Idea*. Make a machine complex enough, and somehow it acquires consciousness and autonomy: "you can transcend your genes … to build an almost entirely independent … locus of meaning on the base your genes have provided" (Dennett, 1995, p. 426). In his view, determinism and autonomy are consistent, which I would call a close cousin to the concept that freedom and slavery are the same thing. I might call Dennett's line of reasoning "magical reductionism." Of course to posit that even a molecule has some kind of "interiority" could also be labeled magical. But I would assert that the "magic" required by not being able to locate a line between "has interiority" and "doesn't have interiority" is considerably less than that of imagining the something-from-nothing entailed by a machine creating consciousness. And there is an empirical test (to be explained later) which at least indirectly gets at this question.

8. *Interiority is, to some extent, non-local.*

This tenet is a set up for the next two tenets. By "non-local" I mean what quantum physicists mean by that term. One interpretation of quantum physics is that a particle can be in two places at once. Another interpretation is that "entangled" particles are separate but communicate instantly. In theory if one such particle were here and its "mate" were at the other end of the universe, then if we flipped the one here "up," the other would instantly flip "down." (Don't ask me what "up" and "down" mean in this context, I don't know.) Of course by the time we got confirmation of this via the fastest speed possible, that of light, we would all be long gone, as would the earth. Also, and this is largely another way of saying the same thing, when a quantum wave function collapses, it does so everywhere, instantaneously. (How this squares with the General Theory of Relativity, under which the concept of simultaneity is obviated, I'm not entirely sure.) And if, for instance, that wave function is associated with a proton, then that proton is "precipitated" from a "super-positional" (quantum) state into a "classical" state. In the way we are used to thinking of chairs, trees and rocks as "real," it becomes real at that point. Previously, to borrow a term of disparagement and use it for other purposes, it's a "ghost in the machine" (suggesting, I believe correctly, albeit inadvertently, a correlation between quantum reality and consciousness).

Another demonstration (or aspect) of non-locality is that of so-called psi phenomena, and the most sober scientist in this field is Dean Radin. Formerly a researcher at ATT Bell Labs, Radin has also worked at GTE Laboratories, Princeton University and SRI (formerly Stanford Research Institute), among others. At SRI the client was the clandestine agencies of the US government. Psi includes such phenomena as telepathy (sending information between two individuals absent normal means, basically mind-to-mind interaction), and remote viewing (being able to see or otherwise sense things at a distance by other than normal means). I have concluded from Radin's work and elsewhere that these phenomena are real. Perhaps the clearest, most scientifically "nailed down" example of psi is provided by the research of Robert Jahn of Princeton University, formerly Dean of the School of Engineering. Over several decades he and his collaborators systematically and scrupulously investigated whether people could influence random number generators (RNG's, essentially electronic coin flippers) to produce more "heads" than "tails" (ones than zeros), simply by a person's *intent* to have them do so, without any physical intervention (see, for instance, Radin, 1997, p. 43, and Jahn, 1987). The short answer, is *yes*, people can do this. The effect isn't large, but it is extremely statistically significant. As much as anything can ever be established by statistics, this phenomenon is established. As Radin has pointed out, calling a baseball player a "power hitter" is a matter of statistics. If you're batting 300, you're doing great, but you're only hitting one in three times at bat.

By the qualifier in this tenet, "to some extent," I mean that even if, as I believe, these phenomena are real, they are nonetheless weak. (On the other hand it is strong enough for Radin to have created and patented a switch, with which one could, for instance, turn on or off a robot on a distant planet, utilizing the effect.) While the CIA used "psychic spying" for decades (Targ, 2008), it’s much better, if possible, to examine a missile launcher in person than to remote view it. Not always possible of course, which is why the CIA employed psychics. (By the way, the program was dismantled after the Cold War and thus was not in place to remotely view alleged “weapons of mass destruction” prior to the invasion of Iraq in 2003.)

9. *In particular similar (or identical) hierarchically negentropic systems share a degree of interiority. This is the view from “inside” such systems.*

10. *The view from “outside” is that hierarchically negentropic systems probabilistically tend to adopt, or conform to, solutions found or chanced upon by similar systems.*

Tenet 10 expresses the findings of Rupert Sheldrake as reported in his books, *A New Science of Life* (1981), and *The Presence of the Past* (1988), and elsewhere. Tenet 9 is my extrapolation, looking at these phenomena (as well as the results of psi phenomena such as telepathy mentioned above) from “inside.” I will attempt to show the nature of Sheldrake’s findings via a series of examples.

Example one. The New York Times publishes a crossword puzzle every day. If you take two groups of people with equal puzzle-solving expertise and have one group try to solve, say, the Monday puzzle on Monday, and then take the second group and, making sure they weren’t exposed to it (the jury sequestration issue), have them try to solve it on the following Saturday, after millions of people around the world have previously worked on it, you will find that the second group does better, gets more right answers in a set amount of time, than the first group. These groups can be widely separated geographically.

Example two. If you take two groups of identical rats with, say, one group in New Zealand and the second group in New York, and you have the first group learn a particular maze, and if, some time later, you set the second group loose on the same task, the second group will learn the maze faster than the first group.

Example three. Scientists sometimes create novel molecules that have never existed before in nature. When they do this, they always have a hard time getting them to crystallize. But once a lab somewhere (let us say New Zealand again) gets the first group of novel molecules to crystallize, then labs elsewhere (say New York) find that it becomes easier.

Two of these examples (people learning a crossword puzzle, rats learning a maze) involve sentient (conscious) hierarchically negentropic systems. One (novel molecules crystallizing) doesn’t. But the pattern of shared and “non-local” (or entangled) learning seems to be the same. Thus, following the prior tenets, it seems reasonable to look at this process from both the “inside,” which is to say from a standpoint where consciousness, or at least interiority, is involved, and from the “outside,” which is to say objectively.

*Note: This brings us to an important point and one where at least parts of the model presented here could be tested and possibly falsified***.**

Let’s take the rats in a maze example and set about the following experiment. First, run the same experiment and confirm it with a fresh batch of rats and a new maze. Next build a set of robot rats with the same level of maze-learning ability (and speed) as the real rats and have them learn the same maze. The hypothesis is that a second group of identical robo-rats in another location would not benefit from the non-local learning that is enjoyed by the flesh and blood rats. The hypothesized reason for this hypothesized deficit in the robo-rats is that, since they are not hierarchically negentropic systems as defined earlier, they presumably have no “interiority.” However, and this is another important point, note that the novel molecules *do* exhibit this non-local learning. Therefore a possible conclusion is that the molecules, hierarchically negentropic systems after all, exhibit or express interiority. In any event, according to the model, they do.

I should note that other interpretations of the above-hypothesized results are possible. For instance, it is possible that non-local learning and interiority are independent effects of some unknown third factor, and that this factor can cause one effect, for example non-local learning, without causing the other. As Hume famously pointed out, correlation is not tantamount to causality. However, without an experimental protocol to tease out different experimental results in this other interpretation, the two interpretations are for all practical purposes indistinguishable. (This is a good example of an instance in which it is possible to draw a philosophical difference between two views without being able to untangle them from a scientific, or practical, standpoint.)

This projected result of the rats vs. robo-rats experiment has implications for the question of whether conscious machines can be made, and if so, in what ways they might differ from biologically-based conscious systems (organisms). Following Roger Penrose (1989), I don’t believe that classical computers, no matter how “smart” (e.g., able to play chess) will ever become conscious. But would robo-rats with quantum (i.e., non-classical) computers for brains suffer the same (presumed) lack of interiority and therefore non-local learning? In my mind that’s an open question. If not, then portions of the model presented here would need to be modified, since not even quantum computers (which don’t exist except in the most rudimentary form yet) are hierarchically negentropic systems. (If quantum computers did become conscious, then a function we could expect from them would be an ability to affect random number generators via intent a la the Jahn experiments described in tenet 8. However, it is unclear to me how it would be possible to program a computer to express intent. Computer programs are, as Dan Dennett [1995] has said, algorithmic: if this, then do that. Dennett believes that Darwin’s genius was that he found a simple algorithm for increasing biological complexity, and that any such algorithm is necessarily transposable to a different medium such as silicon. But how do you program for: If this, then *intend* that? I, at least, have no idea.)

The above examples involve learning, not morphological development. However, while I do not examine it in this essay, Sheldrake devotes a good deal of time on the latter issue in his early books. The orthodox view is that development is controlled by selective switching on and off of genes, whereas Sheldrake’s theory involves non-genetic inheritance. Most of the (genetic) work on this subject was conducted subsequent to Sheldrake’s initial books. While he doesn’t discount the idea that non-local shared learning (my terminology, not his) could have genetic effects, and the implication of his theory is that such effect should exist, in none of his writings of which I am aware does he make the claim that this sort of learning *does* have genetic effects (and he has emailed me that he does not wish to assert this claim). To this extent his theory (but not, at least in my view, its implications) is compatible with the MES since the neo-Darwinian process, with its random shuffling of genes every generation, could be going on in parallel to the processes identified by him. On the other hand, his views are incompatible with the MES to the extent that per neo-Darwinists non-genetic (learned or directed) inheritance is impermissible ("magical" is the term often used).

By the way, Darwin, who didn't know about genes and thus didn't distinguish genetic from non-genetic inheritance, made claims which are strikingly similar to those made by Sheldrake in the realm of morphology: "From the facts alluded to in the first chapter, I think there can be little doubt that use in our domestic animals strengthens and enlarges certain parts, and disuse diminishes them; and that such modifications are inherited" (Darwin, 1859/1964 p. 134). This sentence could be inserted, without modification, into any of Sheldrake's early books. Of course, neo-Darwinists completely disavow this aspect of their hero's work. (Not to mention the following: "[A]t some future period, not very distant as measured by centuries, the civilized races of man will almost certainly exterminate and replace throughout the world the savage races" in *The Descent of Man*, Darwin, 1871/2004, p. 201. Oops!) In any event, I agree with Sheldrake that learning may be inherited as shown in the above examples. Furthermore, I hypothesize that the intent (or mental "push") behind learning sometimes produces heritable genetic effects in biotic systems via influence of the organism's (posited) information/probability (IP) field. (Obviously these effects are, by definition, non-genetic in pre-biotic systems.)

An example of Sheldrake's thinking in relation to inherited learning is provided by the following experiment (Sheldrake, 1981, p. 186). Rats (poor rats again) were placed in a flooded cage. There were two gangways for escape, a lighted one that, unfortunately for the rats, produced a shock when chosen, and an unlighted one. Eventually the critters learned to choose the unlighted exit. When fresh rats of the same species were put in the cage, they learned the task more readily than the first rats. So far basically the same as the maze experiment. Not surprisingly, given that prior experiment, the rats' descendents also learned to find the exit faster than their forbearers. When a genetic explanation for this was formulated, the experiment was changed so that only the offspring of the stupidest rats (who found the exit least successfully) were tested. But even these found the exit faster than earlier generations, seemingly exhibiting shared learning across generations. Thus, in Sheldrake's view, information was passed from one generation to the next in a non-genetic manner. His explanation is that "morphic fields" (which I would translate as IP fields) are formed and passed along, these fields constituting non-genetic inheritance of the descendents.

While it is slightly off the main thrust of my argument here, I want to note one thing. Per Sheldrake these fields should build up generation upon generation. And, as described earlier, there is evidence of this with, for example, people getting better at IQ tests over time (as self-described debunker of pseudo-science, Michael Shermer, noted in his talk at one of the TED conferences viewable on the web). But there are also counter-examples. After the fall of the Roman Empire, people seemed to lose a whole host of abilities, from perspective drawing to engineering, for a thousand years or more. One possible explanation for this loss is that these abilities were an expression of a more complex hierarchically negentropic system, in normal English, a more advanced civilization. By this tentative hypothesis, Rome had more layers of hierarchical negentropy than Medieval society, and shared learning was disrupted when that hierarchy became shallower, since the fields were an expression of the deeper negentropic hierarchy. (This would correspond to Wilber's [1995, p. 44] view that holons break down holoarchically, in the reverse order from which they were formed.) Another possible explanation is that the generations-long shock accompanying the collapse of Rome traumatized people so much that they were unable to retain this knowledge. The simplest explanation is that there was just no one around to teach these skills to the next generation. However, in the above experiment, one generation of rats did not teach the exit-finding skills to the next generation. In any event, it's clear that there are instances where cumulative non-local shared learning breaks down.

11. *The partial non-locality of hierarchically negentropic systems exists in terms of both time and space.*

12. *The deeper the hierarchy in hierarchically negentropic systems, the more non-locality is evident.*

Space

Non-locality in terms of space was illustrated with the Sheldrake examples under tenets 9 and 10. Rats in New York learn, non-locally, from their New Zealand or Australian "mates." (Whether this is totally non-local – would rats on the other side of the universe benefit like their New York brethren? – is something about which I don't speculate.)

Time

Non-locality in terms of time mostly concerns "retro-causality" since "forward causality" is normally what we mean by the term. So, to retro-causality. Lynne McTaggart in her book, *The Field*, has a number of examples. Here is one (McTaggart, 2002, p. 170). If you remember back to tenet 8, there was mention of the work of Robert Jahn and the ability of people to influence the output of "heads" or "tails" in random number generators. Now what if the RNG was let run by itself, with no attempt to influence it via intent, and with the results stored on magnetic tape. In this case a "head" could be a click in the right ear when played back, and a "tail" a click in the left. The question is whether a subject in the experiment could go back some days later, play back the tape, and get more "heads" (or "tails") than chance allows. The answer is that people can in fact do this and that therefore some kind of retro-causation appears to exist in this case. (Amit Goswami [2008, p. 170] reports in his *Creative Evolution* that a similar experiment, with similar results, was conducted with the results printed out onto paper as opposed to being recorded onto audio tape). Thus at least people, if not less advanced hierarchically negentropic systems, appear to be able, in some instances and to some extent, to influence the past as well as the future. (Per personal communication with Dean Radin, there is experimental evidence for non-humans affecting RNG's, apparently extending down as far as cockroaches and even plants).

Another example is being laboratory tested with the results not known at the time this paper is written. John Cramer, a physics professor at the University of Washington (Seattle), is testing whether an entangled "wave-acle" (wave/particle) that is forced to act one way or the other (wave or a particle) can force its "mate" to act in the same manner. If that is successful, the next step will be to see whether a wave-acle in the present can affect its mate in the past (Cramer). This will be done by sending one down a short fiber optic cable and another down a long one. If the experiment succeeds, forcing the one that comes out of the long cable, slightly later, to behave as a particle (or wave) will force its mate, in the slightly distant past, to assume the same form. (Naturally, this experiment is more complex than described here; however, I believe I am giving the gist of it, namely retro-causality by entangled particles.)

The third example references the “double slit” experiment of quantum physics, which is explained under tenet 14 below. The essence of that experiment is that the observation of a quantum particle (wave/particle) affects the character of that wave/particle and that observation of it at time t, can cause the collapse of the wave function associated with the “wave-acle” at time t-1, which is to say, in the past.

A fourth example explores whether people sometimes react to a shocking picture before they have seen it. This is termed “presentiment” and Dean Radin explores this issue in his books, *The Conscious Universe* (1997) and *Entangled Minds* (2006). A randomly chosen picture, either of a calm nature (nature scenes, cheerful people) or of a shocking nature (murder victims, erotica), is shown to a person. As expected the subject’s galvanic skin response is high when they are shown the shocking pictures and subdued when they are shown the calm pictures. However, the interesting thing is what happens slightly before the picture is seen. Subjects react, albeit not as strongly as when they are actually observing the image, to the shocking picture even before it is seen by them. Once again the future seems to be affecting the present. Alternately, the subjects are (unconsciously) viewing the near-future, which amounts for my purposes to much the same thing.

A final phenomenon to take note of is that a network of Random Number Generators (which for this purpose were renamed Random Event Generators: REGs) has been running for a number of years at locations around the world. These were put in place to investigate the possibility that the REGs might register changes correlated to events in the world. Interestingly, exactly such a correlation was found, for instance with the funeral of Princess Diana and the announcement of the verdict in the OJ Simpson trial, both widely-broadcast and therefore focused-on events. The (tentative) conclusion is that collective human attention on certain events moves REGs. Considering the results of the Jahn studies at Princeton cited earlier, perhaps this is not too surprising. What is surprising (or more surprising) is that these REGs registered the devastation of the Indian Ocean tsunami of 2004 before (supposedly 24 hours before) the earthquake that caused it occurred! Likewise they supposedly anticipated the 9/11 terror attacks in the USA. This then appears to be a future event “casting a shadow” on the present state of electronic devices, the REGs.

Depth

As for deeper hierarchically negentropic systems embodying greater degrees of non-locality (tenet 12), this is one of those “looks right” statements, but there is evidence on either side of this proposition. Entangled electrons are certainly not as deep a HN system as a person, and yet they appear to display perfect non-locality. And if we compare people and their companion animals, is it generally true that it is the people which are more “psychic”? Among Rupert Sheldrake’s more recent books is one entitled, *Dogs that Know when their Owners are Coming Home* (1999). The title of the book pretty much states his findings. Note that it’s not the owners who know when the dogs are coming home, though. So at least on that score, the shallower HN systems (the dogs) seem to have the edge. The third counter example concerns the Indian Ocean tsunami. It was found that no elephant keepers were killed in that disaster. When their handlers were interviewed, it seems that the animals sensed danger and took to the hills, taking the handlers with them. (Unfortunately I have lost the sourcing for this claim. Of course, even if it is accurate, it may have a more mundane explanation, such as acute hearing in the relevant octaves. Also it would be interesting to know when the animals became uneasy. Was it prior to or following the earthquake which caused the tsunami?) And of course there are the REGs associated with this event mentioned earlier.

And yet, and yet … albeit without too much data to back me up, I continue to believe that the most attuned people exhibit a greater degree of non-locality than our animal friends (not to mention our entangled electron buddies). One possible example of this is in the area of "distant energy healing." Of course this presupposes that one believes such a thing exists, but, in keeping with my *modus operandi*, I am not going to explore here the evidence pro and con, and just state that it does. Talented people are able to become a conduit of healing for others, even others in distant places. This skill requires a tuning in to the other as if space did not exist. In other words, one embraces non-locality. And although certain people can do this, there is no evidence that any other species is able to do so. Thus I confer the prize for non-locality to the species with the deepest hierarchically negentropic status on the planet. That would be us.

Now I realize that these examples are a long way from establishing tenet 12. However, if deeper HN systems have more interiority, which under the model they do, and if interiority correlates with independence from space and time, which psi effects suggest, then this tenet is likely true. On the other hand, it may be that this tenet has not been established to the full satisfaction of the reader (or, for that matter, the author). But there's an old saying in aeronautics, "If it looks right, it is right." As stated earlier, this looks right, at least to me. Whether it will fly or not, well, we shall see.

13. *Lower levels of the hierarchy in hierarchically negentropic systems have causal affects on higher levels and vice versa.*

14. *Also, causal affects operate from exterior to interior and interior to exterior.*

Down to up causality is just normal old scientific materialism. It is what Francis Crick was referring to when he said,

> You, your joy, your sorrow, your memories, your ambition, your personal identity and your free will are in fact no more than the behavior of a vast assembly of nerve cells and their associated molecules.

As a good reductionist, he would then deconstruct molecules into atoms, atoms into sub-atomic particles, etc. Whatever's at the bottom affects things above but not vice versa. We act, but since we are robots, our actions are just the workings out of sub-atomic particles. That's the view.

By the way, the view of people such as Richard Dawkins is slightly different than this, at least in emphasis. From their perspective the principle unit of causality is the “replicator,” which would be the gene in biotic systems. Everything the organism does can, in principle, be explained by these “selfish” actors (selfish, petulant, and, it’s not going too far to say, positively Hitlerian). The phrase “at least in emphasis” in the above sentence is meant to indicate that they are nonetheless on board with the enterprise of deconstructing the gene further into more basic actors. Dan Dennett explains this approach as reductionism (the gene is the principle actor) vs “greedy reductionism” (attempting to explain human behavior in terms of the quark or whatever).

In any event, the view here is that causality runs both ways. If you’ve got a headache, you can take an aspirin and that may solve it. Matter to mind. On the other hand, if you meditate you may be able to relax your body and the headache may go away. Mind to matter. A materialist would say that “you” “deciding” to meditate is just the working out of sub-atomic articles, which is why trying to argue all this out with a committed materialist is probably no more likely to succeed than arguing about the reality of evolution with a committed fundamentalist. Collingwood would say that they are exhibiting their “absolute assumptions.” These assumptions often exhibit what I sometimes refer to as “viewpoint lock.”

> There's a question, a certain question I want to discuss with you. It's a political question ... the question of marriage.
> It's a political question?
> Well yes. Everything's political. Like everything else the relationship between a man and a woman has a socio-economic basis. Marriage must be based on mutual beliefs, a common attitude and philosophy towards society.
> And affection.
> Well, yes, of course that it is also necessary. Such a relationship can have positive social value when two people face the world with unity and solidarity.
> And affection.
> At any rate I personally am in favor of such a socio-economic relationship.
>
> – from *Fiddler on the Roof*

A committed Marxist sees everything in terms of politics. A committed Freudian sees everything in terms of sex. A committed reductionist sees everything in terms of simpler units of matter. In the view here causality goes downward because higher levels of the negentropic hierarchy contain more interiority and interiority, at any level, “wants” to become more so. Thus the lower “wants” to conform to the higher (thereby becoming more negentropic) and is therefore amenable to “suggestions from above.” As others have conceptualized it, the organism (the higher negentropic system) imposes a probability field on lower levels of the hierarchy (organs, cells), causing these levels to probabilistically conform to this field. So upper to lower changes the probability of events “down there,” causing them to become less random and more patterned. Note that upper to lower does not eliminate randomness, only reduces it. Note also that the upper will typically delegate most of the action, and decisions, to the lower. You may be able to lower your heart rate via meditation, but typically you just let it do its thing. And in all likelihood you don’t even know what your spleen does, let alone how it does it. And it generally doesn't need any suggestions from you, the higher negentropic system, to do its thing (whatever that may be).

The same general analysis applies for out-to-in and in-to-out. The aspirin mentioned above can either be considered down-to-up or out-to-in. The most famous example of in-to-out causality is the "observer effect" of quantum physics. I take this effect to be the essence of this field of study for those us not immersed in the daunting mathematics and laboratory techniques of this discipline. Stated simply, the observation of a quantum system affects the system. Since all matter is ultimately made up of quantum systems (wave/particles), this can be stated as, *The observation of the universe affects the universe.* Merely the act of you (and perhaps your cat—or or Schrödinger's ☺) observing a system affects it. (Thus to Laplace's contention that were one to know the condition of everything in the universe, it would be possible to predict everything that came thereafter, the counter-statement is that the mere knowing, i.e., observation, of this would therefore change it. And if it is changed, one no longer fully knows it.) Many excellent popular books have been written on this subject, so I won't recapitulate the material here. But let's just take the most basic experiment, that of the double slit, for review. Nobel Prize winning physicist, Richard Feynman: "The experiment with two holes … contains the only mystery … of quantum mechanics" (quoted everywhere).

The protocol is that one has a light source, then a blocking screen with two thin slits in it, and then an observing screen on which one can observe the light after it passes the blocking screen. Because light is a wave (well, sort of), when it passes the blocking screen, it shows up on the observing screen as bands of light and darkness (assuming the slits are narrow enough), which are interference patterns. These are similar to interference patterns in a pond if you simultaneously throw two stones in the water. In some places the top of a wave from one stone will be in the same place as the top of a wave from the other, with the result that you get a big wave at that point, the addition of the two waves. In other places the top of one wave will be in the same place as the bottom of the other, and they will cancel each other out at that point. That's essentially what you observe on the observing screen, although the bands of light and darkness will be displayed horizontally, like a bar code.

Light consists of photons (which is why it's only "sort of" a wave) and these little "balls of light" can be shot one at a time through the blocking screen (although this is typically done with electrons). If you do that, you still get the interference pattern on the observing screen, which indicates that the photons are entangled across time (tenet 11). Now what happens if you observe which slit those little balls of light go through, that is, the left or the right slit? What happens is the interference pattern disappears and the resulting pattern is consistent, not with the interference of waves, but rather with what one would see if the little balls were actually little physical balls, say of paint. Observing the system affects the system. Even stranger one can observe the photons between the time they have left the blocking screen and before they have arrived at the observing screen, in mid-flight so to speak. So if they are waves, they have already passed through both slits (in order to create the interference pattern). Observing the photons in this manner, after the fact, causes their wave character to disappear and their particle character to reappear. This is called "collapse of the wave function," and it's about as much quantum physics as I'm going to present here. Bottom line: The observation of the universe affects the universe. Second bottom line: Observation now can affect the universe then:

"The universe is not [only] stranger than we know, its stranger than we can know."
– Richard Feynman

One note: There are supposedly about a dozen models of quantum physics, one for every taste:

> *First peasant:* Why should I break my head about the outside world? Let the outside world break its own head.
> *Tevye:* He is right. As the Good Book says, "If you spit in the air, it lands in your face."
> *Revolutionary:* Nonsense. You can't close your eyes to what's happening in the world.
> *Tevye:* He is right.
> *Second peasant:* He's right and he's right? They can't both be right.
> *Tevye:* (playing the role of quantum physics). You know, you are also right.
> – from *Fiddler on the Roof*

In the model I am using here ("you are also right") observation by a person (or cat) is not the only thing that collapses the wave function. Rather any flow of information from the quantum to the classical world does so. Otherwise the universe would have had to evolve for 14 billion years in super-position until a human (or similar) observer came along to flip it into classical space/time. A few quantum physicists subscribe to this model. But although all quantum models involve paradox, this is "a paradox too far" for my taste. Recall Paul Davies' speculation about the reason the universe is bio-philic above: "consciousness did it." In that speculation consciousness in the future (or at any time) affected (or affects) the very structure of the universe at the time of the Big Bang. If so, then sufficient interiority may be "baked in" to the structure of hierarchically negentropic matter to account for spontaneous collapse of the wave function ("objective reduction"). So in the model of quantum physics adopted here, leak of information from a quantum particle/wave equals measurement of that particle/wave equals observation of that particle/wave by a hierarchically negentropic system. (Thus another title for this essay could have been *Evolution and the Observer Effect*.) This is because observation (interiority) is an inherent aspect of hierarchically negentropic systems. I suppose paradoxes are like eggs for breakfast. You order 'em the way you like 'em.

15. *As reductionism only fully recognizes the former affects (lower to higher and exterior to interior), it is wrong, or at least incomplete.*

16. *Idealism, while not a major force in today's world, makes the opposite mistake.*

Reductionism.

Reductionism was briefly dealt with above (when I said it wasn't worth arguing with a person holding such a view: "At any rate I personally am in favor of such a socio-economic relationship"). The examples I gave were intended to establish that effects go both ways, lower to higher and higher to lower, as well as exterior to interior and interior exterior. Nonetheless, I echo the view of McFadden on this issue:

> All ideas have their time and I expect that the twenty-first century will see the flowering of quantum biology. Its roots can be traced back to Schrödinger's (1944) "What is Life," but

> though that slim volume stimulated many scientists (such as James Watson) to consider life's physical basis, reductionist biology needed to run its course and dissect living cells down to the level of fundamental particles before its full implications could be appreciated. I believe we are now on the brink of a new adventure which will bring about the synthesis of physical and biological sciences through quantum mechanics. (McFadden, 2000, p. 265)

Idealism.

Idealism comes in several flavors. The most extreme version says that everything is mental and nothing is real except perception. In other words all objects are mental objects. Amit Goswami, a quantum physicist, espouses a variation of this view when he says that the moon doesn't exist except when we (or presumably someone else) is looking at it – albeit, in his view, it does exist as a mass of zillions of quantum objects in super-position (Goswami,1993, p. 59). That's pretty extreme. And, needless to say, it is not falsifiable, although, to give him his due, none of the various schools of quantum physics can be ruled out (falsified). It does no good to say, "That's crazy." They're all crazy.

> Do not keep saying to yourself, if you can possibly avoid it, "But how can it be like that?" because you will get "down the drain," into a blind alley from which nobody has yet escaped. Nobody knows how it can be like that.
>
> – Richard Feynman

Most idealists, though, do not deny the existence of independent objects in the world. They just say that those objects are not *ultimately* real. God, mind, consciousness, or an equivalent is the only ultimate reality. So most religions are forms of idealism in this sense. And as with the hard-core reductionist, there's not much point in getting into an argument with someone about their God. ("At any rate I personally am in favor of such a socio-economic relationship.") Once again, the view here is that, either for all practical purposes or for real, interiority is a co-equal to matter/energy. And, once again, I don't ultimately try to figure out "who's on first."

> Who?
> Yes.
> I mean the fellow's name.
> Who.
> The guy on first.
> Who.
> The first baseman.
> Who.
> The guy playing ...

17. *Up-to-down and in-to-out causality are, to some extent, the same thing, since systems with deeper levels of hierarchical negentropy embody greater degrees of interiority.*

18. *Likewise down-to-up causality is, to some extent, the same thing as out-to-in causality.*

These tenets follow from the previous ones. Tenet 17 appears to embody the opposite property of these systems as laid out by Ken Wilber in SES in which he, following Francisco

Valera (a sometime collaborator with Evan Thompson), asserts that lower holons "see" their upper counterparts as being outside themselves (Wilber, 1995, p. 59), while here I am saying that such physical holons (hierarchically negentropic systems) "see" their upper counterparts as inside themselves. I suppose, according to Wilber's philosophy, the difference between these points of view would be that Valera is talking about the exteriors and I am talking about interiors.

In any event, as mentioned several times previously, the idea is that upper level HN systems impose something like an *information/probability (IP) field* on lower level HN systems. Exactly *how* this is done is "beyond my pay grade." How does gravity work? Until Einstein the answer was, *It just does*, and I'm no Einstein. (And for that matter, and in a similar vein, Darwin had no idea where heritable variation came from.) A problem is that while individual particles, such as a proton, can reside in super-position and thus can be amenable to a field effect from cells, for example (upper level to the proton), cells themselves are fully classical systems and thus cannot, in our current understanding (or at least in my current understanding), reside in super-position (unless they are cooled to near absolute zero, at which point they aren't of course living cells any more). (One could nitpick this and say that nothing is a fully classical object, but the above is close enough for my purposes.) So how does the an organ (like the heart) or the whole organism itself (like a cat) project its influence downward to the cell? Luckily this is a paper on natural philosophy rather than science, so hopefully I can get away with *It just does*. That's my plan anyway.

Okay, okay, I'll speculate. One possibility is that each level of an organism (advanced hierarchically negentropic system) has its own mind (or, if you prefer, "mind") associated with it. Single celled organisms have no brain, but they exhibit intelligence, a mind-like quality, in seeking food, avoiding prey, reproducing and the like. Likewise we may speculate that a "gut feeling" exhibits the "mind" of one's "gut" (i.e., the digestive region). A property of mind, it would seem, is to hold possibilities in super-position. When I am trying to decide something difficult, it feels like I am levitating the possibilities in mid-air and preventing them from collapsing to earth prematurely: "I could do this or do that or the other thing." So my speculation is that super-position at the atomic level is referred upwards via the various levels of mind (or "mind"), which also holds them in super-position. How? It just does. And, just to make speculation even more speculative, when we are trying to figure out something new, for example, the calculus pre Newton, possibly we refer it upwards to a "level of mind" above our own. At least that's what it feels like to many artists and scientists when the answer materializes in "mid air" so to speak.

A contrasting, more conservative, view on this particular issue is provided by Johnjoe McFadden. He states that "life is a system that uses internal quantum measurement to capture low-entropy states that sustain the state of the system against thermodynamic decay" (McFadden, 2000, p. 258). So far, so good. But while it's not totally clear to me whether he sees that internal measurement extending upwards from the level of cells to that of organs, and then to that the organism itself, my best read is that, in his view, it doesn't. However, he does see quantum processes linked to human consciousness. So in this view quantum effects are turned on (basic life operations), then off (level of the organs), then on again (consciousness) as one rises in the biotic hierarchy. Maybe. In any event, as stated above, the view here is that quantum observation/measurement does extend upwards.

By the way, compare McFadden's definition of life with the following definition by Amit Goswami.

> A living being consists of tangled hierarchical quantum measurement apparatuses that are representations of the vital blueprints of biological functions including, but not restricted to maintenance and reproduction. Such a being is capable of self-reference because in the process of quantum collapse involving it, consciousness identifies with the being. (Goswami, 2008, p. 129)

Pretty close, and because this book does not reference McFadden's, presumably independently arrived at.

19. *Taken to its logical end point, the ultimate hierarchically negentropic system would theoretically be totally non-local as to time and space and share an interiority common to all such systems lower in the hierarchy, including all life forms. The overlap between such an ultimate hierarchically negentropic system and what the religiously inclined call "God" is reasonably evident.*

20. *Because life continues to evolve, such an ultimate hierarchically negentropic system would logically also continue to evolve.*

I am not saying that there are any hierarchically negentropic systems above the human level. On the other hand, I don't see why there shouldn't be. Do we really think we're the best thing this old universe can come up with? If more advanced HN systems do exist, and if we are part of them, it's only speculation as to what form they might take. Perhaps the picture of a colony of cells, like a jellyfish colony, forming a single organism over evolutionary time provides an analogy. And possibly the internet might represent the hardware for the nervous system of such an organism's mind, a "precipitation" out of quantum space of a primitive world brain. As with the jellyfish prior to a united organism being formed, it may be that this upper level exists as a "virtual" or "implicit" system, an "attractor" that pulls the colony towards it. Further, if interiority is to any extent non-local, then it's just another jump to imagine that this world mind, if it exists, might form a cell in a universe mind, with other inhabited planets forming other neurons within the brain of this higher level mind (or, if you prefer, higher level being).

Naturally this is the purest of pure speculation, but it does, at least indirectly, come into play when I consider below how upper level hierarchically negentropic systems direct and create the "probability space" for their lower level counterparts. A premise of this paper is that this work, creating the "space" from which natural selection can choose, is the property of the HN system itself. This premise is in contrast to both neo-Darwinism (the creative, or option-producing, process is totally random) and to Intelligent Design (ID; God, or an equivalent, is the creative agent). However if interiority accumulates upwards, if, per Emerson, we are all part of some great cosmic ocean of consciousness in the deepest reaches of our being, then the view presented here is not totally incompatible with a *radically* liberal construction of the ID view. By analogy it is somewhat like the difference between a super-computer as a giant, unified hunk of iron (HAL in the movie, 2001, the ID view), or as a giant network of fairly dumb regular old personal computers chained to some purpose (the view here). The later is the standard way to create super-computers these days, and in some ways the internet is the ultimate version of this model (though, unlike a super-computer, the internet is not centrally directed… well, not unless Google has somehow secretly taken over our computers!).

The model here has intelligence distributed to the utmost extent, down to the atomic level and below. Which then accumulates upward, at which point the upper acts as an "attractor" on the lower (and, as speculated above, may do so even if the upper level is not yet formed but only exists in a virtual, implicit, or quantum form). So if there is such a system above the human level (or if it exists as an implicit form), then it may be directing a teleological "pull" on humanity. But, as I said, this is all total speculation, and all I want to do it to put it out there as a logical possibility. The system here allows, but does not require, it. (Similarly quantum physics allows for something like mysticism—remember Max mind-is-the-matrix-of-all-matter Planck—but does not require it.)

One major difference between even a radically liberal construction of Intelligent Design and the view presented here is that ID, in concert with the Modern Evolutionary Synthesis sees no biological creativity at the cellular level: "Cells are robots" per Michael Behe, prominent ID theorist (2007, p. 19). The neo-Darwinian view is similar: "Each one of us is a machine" (Dawkins, 1996, p. 3). The view here, in contrast, is that each level of a hierarchically negentropic system has, along with a degree of interiority, its own creativity. And the assumption is that these two, interiority and creativity, are linked for the purpose of maintaining or increasing negentropy.

One more thing. Prominent contemporary objectors to religion and to the idea of God such as Messrs. Dawkins (2006), Dennett, Hitchens and Harris (2004), most basically object to the idea of a supernatural Entity (or entities). If the laws of physics don't allow changing water directly into wine (whether Chablis or Chardonnay) then we can't credit stories of chaps doing exactly that. In other words, their books on this subject essentially object to pre-rational, bronze-age thinking, of which they lovingly recount many florid examples. Fine. But what I am talking about here is something else. It is whether interiority is a byproduct of matter at a certain level of complexity (their view), or alternately whether the embrace of interiority and negentropic matter goes back to first principles in somewhat the same sense that mass and spin go back to first principles. And, if this latter view is correct, as I and many others claim, then what might be the implications for evolution? The first view envisions the evolution in the universe, by analogy, as a tumbler of dice connected to a machine. The second, echoing Sir James Jeans in a quote above, sees nearly the opposite: "The universe begins to look more like a great thought than a great machine."

The Picture

Such are the tenets, but I haven't really sketched a picture of how these might actually operate in evolution. For a start, my view is that the Darwinian proposition, that natural (and sexual) selection drives evolution, is largely correct. But I argue here that neo-Darwinism, under which random mutation alone creates the design space from which natural selection picks and chooses, is too narrow to account for the data at hand. This is not to deny that an “arms race” (Dawkins) between genes takes place at their level. It does. It’s just that there is more going on, on more levels, than that metaphor allows for. I will start out with an example that illustrates a problem with both the neo-Darwinist (MES), and the Intelligent Design (ID) approaches. This example is taken from *Quantum Evolution* (McFadden, 2000, pp. 271-272).

Tuberculosis (TB) is an extremely deadly pathogen. Initially, it was successfully treated with streptomycin. However, in time TB developed a resistance to this antibiotic. This is explained straight-forwardly since a resistant mutant will generally be found in one in every 10^8 bacilli. However, the human body can harbor 10^9 of these bacteria, so it’s just a matter of time before a successful mutation will take hold and multiply. The response to this was to start treating patients with multi-drug therapy. If mutations in TB conferring resistance to a drug A occur in one of every 10^4 bacteria, and to drug B in of every 10^5 bacteria, then a mutation that successfully withstands both drugs should occur in one of every $10^4 \times 10^5$ or 10^9 bacteria ($10^9 =$ 1,000,000,000, or one billion). With four drugs combined one would expect a successful mutation in one of 10^{24} bacteria. This is about 2.2 billion pounds worth of TB, way more than exists in the world, let alone in any one patient, obviously. According to standard neo-Darwinist theory, it’s useless for a TB bacillus to develop resistance to just one drug, since it won’t pass along any progeny to develop resistance to the second drug. It’s like an obstacle course (except that you, as a tuberculosis bacillus, can take obstacles in any order you wish). If you get eliminated by the wall-climb, you (or actually your progeny) don’t get to go on to the ropes, etc. Therefore multi-drug resistant TB should never develop because all TB bacilli should be eliminated after the second or third “obstacle.” Yet it does, and it’s a major health problem throughout the world. This phenomenon is sobering when one contemplates its unfortunate implications for the development of permanently-efficacious antibiotics.

This is a very simple biological problem and yet, unless further research indicates otherwise (which, obviously, it could do), neo-Darwinism can’t successfully solve it (a statement to which I would not expect assent from the biological orthodoxy). And according to McFadden the same analysis can be applied to cancer (McFadden, 2000, p. 273), another health scourge. So the Modern Evolutionary Synthesis appears to be in trouble, even if this isn’t generally acknowledged. Naturally this example is not much solace to proponents of Intelligent Design either, at least if God is the presumed agent that overcomes “irreducible complexity,” of which multi-drug-resistance is an elementary example. We would have to imagine a God Who is working overtime to loose pathogens on the human race. (Perhaps a cousin to the Sociopath of the Old Testament? Strangely enough, Michael Behe in *The Edge of Evolution* actually entertains such a morbid viewpoint when he asserts, “Malaria was intentionally designed” (Behe, 2007, p. 237). Yes, it’s conceivable (if just barely), but it doesn’t seem likely. Following a dictate of Achem’s Safety Razor (sic), we should probably endeavor to keep miracles to a minimum, especially if they are the type that kill us.

The next example concerns the work of Harvard biologist John Cairns and colleagues, who, in the 1980’s, studied a strain of Escheri Coli bacteria. Normally this particular strain is unable to metabolize lactose. But when they exposed the bacilli to lactose and deprived it of all other foods, the bacteria became the beneficiaries of a mutation allowing lactose metabolization, while a control group, not deprived of other foods, had no such beneficial (to the organism) mutation. This appeared to be directed (or "adaptive") mutation in defiance of neo-Darwinian principles, under which all mutation is random. When these results were published in the prestigious journal, *Nature*, it set off a furor. (Of the resulting papers my favorite title asks, *Has the Unicorn Landed?*) Following that uproar Cairns did back off somewhat in his initial claim as to the degree with which mutation was (or appeared to be) directed, subsequently claiming only (only?) that the rate of mutation was preferentially directed to a particular *region* in the genome. In other words, one address of the genome, an address relevant to the environmental stress the organism was encountering, was made to mutate faster than it normally would, and faster than addresses on either side of it.

> Others such as Professor Barry Hall at Rochester University have also detected adaptive mutation in a variety of bacterial systems. In one of his most recent experiments, Hall measured the mutation rates in non-growing E.Coli cell for two different DNA bases in the same gene. When neither gene was beneficial, then mutations occurred at the same rate, but when one conferred a selective advantage, then its mutation rate was enhanced. (McFadden, 2000, p. 263)

While these examples are not as dramatic as (my understanding of) Cairn's original claim, they still appear to represent an organism shaping and directing its genome. We might call this "soft" directed mutation. What is clear is that there is *some* level of downward causation going on here. It's simply a matter of degree. As alluded to below, the view of McFadden is that these mutations happen in quantum space, and then are precipitated out when they can be utilized by the bacteria to aid in their survival.

Another similar example of what may be adaptive mutation is recounted by Brown University biologist Ken Miller in his book, *Only a Theory* (2008, p. 80), in which he recounts the story of bacteria which apparently adapted to metabolizing nylon in the absence of other foods. Miller, who doesn't deal with adaptive mutation in his book, offers this as an example of general biological creativity in evolution. In contrast to the Cairns experiments (and despite language in the book to the contrary) here the bacteria were apparently not facing starvation but rather something more like prolonged hunger (personal communication), and thus more normal MES principles may have been in play.

As suggested in the opening of this essay, the Cairns experiments may represent a kind of Michaelson-Morley experiment for our time. To repeat, that former experiment ruled out the luminiferous ether (or at least put a couple of torpedoes in its hull), and set the stage for Einstein's relativity theory. The Cairns experiments, in the view of some (if by no means most) scientists, rules out the heart of the Modern Evolution Synthesis formulated in the first decades of the twentieth century, as the sole mechanism of genetic adaptation. Per the result of Cairns (and others), genetic mutation is, in part, directed by the organism (or the organism and its environment) and is therefore not totally random as required under neo-Darwinism. Therefore these researchers have demonstrated downward biological causation (see one take on this here http://www.kenarenson.com/uploads/Memo_re_Directed_evolution.pdf).

The next example is somewhat similar to the above. However, it demonstrates beneficial (to the organism) mutation in a body of cells not exposed to a toxin, apparently picking up information on selection pressure from a subset of these cells that are exposed to it (Hill, 2000). The head researcher was Miroslav Hill from the Medical Faculty, Brno, Czech Republic. As best I understand the protocol, Hill and his colleagues grew hamster cells in culture, separating a portion of the culture in each period, and exposing them to a toxin, with the main body of the culture remaining unexposed. The reason for doing this was to simulate a much larger body of cells exposed to the toxin. In this way, the researchers could determine what percentage of cells randomly mutate to confer resistance, as under the MES. At first all the cells in the separated portion (those exposed to the toxin) died. After a number of repeats a few cell colonies resisted the toxin, then many did so. Interesting. And even more interesting, the main body of cells, which were never exposed to the toxin, *also* acquired resistance to the toxin. This is totally in conflict with neo-Darwinian principles. This example, emailed to me by Dr. Sheldrake, indicates how his proposed morphic (information/probability) fields may fit together with neo-Darwinian genetic evolution (although he has not, as far as I know, formally developed this line of reasoning). Namely (this is my interpretation) the unexposed cells may share a dilute version of the environment experienced by the exposed cells. Vaguely similarly to the way we can acquire resistance to polio or the flu by being exposed to a dilute version of these pathogens, so the unexposed cells may be "inoculated" by virtue of the experience of their exposed "brethren." Thus some form of at least partial non-locality (entanglement) seems to be connecting the cells either by a "morphic" (information/probability) field, or by some other means. (For a fuller description of Hill's findings see the 2009 revision of Sheldrake's *A New Science of Life*, pp. 258-262)

The final example is what amounts to a kind of folk observation. And that is that camels, kangaroos, and people, among other species, all have calluses where they need them, and nowhere else. Are we to imagine that a callus-conferring gene was established and then started slapping areas of thick skin on the bodies of camels higiley pigiley, with natural selection sorting out that a callus on the top of one foot or the inside of its intestine isn't of much adoptive value? Which is more likely, that totally random mechanism, or one where some kind of feedback loop exists between the animal and its genes (phenotype to genotype), that is, some kind of neo-Lamarckian mechanism? (Darwin, quoted earlier: "From the facts alluded to in the first chapter, I think there can be little doubt that use in our domestic animals strengthens and enlarges certain parts, and disuse diminishes them; and that such modifications are inherited.")

I think the answer is reasonably evident. However, neo-Darwinists don't see it the way Darwin did. Richard Dawkins devotes a number of pages in his *The Blind Watchmaker* (p. 298 onward) to debunking what he identifies as this "myth." His main point is that genetics is a recipe (mix two cups of flour with a tablespoon of yeast, etc.) as opposed to a blueprint (e.g., of a house). So there is no one-to-one correspondence with a genetic trait (calluses on the bottom of feet) and a gene. (Of course Mendel found exactly such one to one correspondences, but this is not important for the argument here; we can concede that these correspondences don't normally exist.) Therefore there might be a gene (or series of genes) that say, in effect, "If a patch of skin gets rubbed, make it thicker." This would then explain thicker skin where kangaroos are abraded, but it leaves out any explanation of why a "joey" (baby kangaroo) would have appropriate calluses "in utero." If we imagine an "uhr-kangaroo" with no calluses as a joey but with thicker skin as an adult, how does it come to pass that this trait gets transmitted to the unborn infant? Once again, under the neo-Darwinist (but not Darwinist) viewpoint it would seem that evolution must have slapped calluses here and there and let natural selection work things out. The trait for forming calluses where needed seems straight-forward, but the trait for pre-formed calluses, in the absence of phenotype to genotype feedback, does not. In my mind anyway, Dawkins and his cohorts have not made the case. (This may be another instance of, "If all's you've got is a hammer.…")

McFadden, a minority of other biologists, and the quantum physicist Amit Goswami, among others, believe that instances of partially directed mutation exist. And while this seems fairly evident from the work of Cairns and others, it is nonetheless not accepted by most biologists, wedded as they are to neo-Darwinism orthodoxy. As mentioned earlier, per McFadden the mechanism for this phenomenon is quantum measurement of atoms along the DNA molecule by the cell and its environment. I provisionally accept his proposed mechanism, but I am not going to even attempt to explain it here except to say that the general idea is that in quantum, as opposed to classical, space, the genome can explore myriad different permutations all in "superposition" prior to measurement and precipitation into classical space, which happens once a genome is able to replicate (e.g., by being able to metabolize lactose). As I have alluded to previously, in his view this process is confined to single-celled evolution, with neo-Darwinian processes taking over at the multi-celled level. (For details see McFadden's *Quantum Evolution*).

But here I am casting my net somewhat wider, albeit in a less "nailed down" scientific way, and more in a way compatible with the term, natural philosophy. First of all, I surmise that the same process implicated in directed mutation is also at work in novel molecules crystallizing (and in protein folding) a la Sheldrake. I also surmise that, much as a cell may precipitate a directed mutation, or a series of them, out of quantum space, so the same general process is at work when someone, and very often two people simultaneously, precipitate a new idea out of who-knows-where (the noosphere? the quantum multiverse?): Darwin and Wallace (evolution by natural selection), Newton and Leibnitz (the calculus), Freud and Jung (the unconscious), the list goes on.

As suggested earlier, it may be that what McFadden sees as an act of "quantum measurement" is simply the outside of what from the inside is "perception" by the interiority of a hierarchically negentropic system. This is more or less Goswami's view, although he tends to conflate that interiority with "quantum consciousness" in the largest possible sense, that is, with God. In his view things can be made to fall in place "when God-as-quantum consciousness is recognized as the organizing principle of creative evolution in biology" (Goswami, 2008, p. 44). My preference is to limit use of the "g" word, as I find it generally just confuses things (gather a thousand people and you will likely get a thousand different definitions for god). So in the tentative formulation envisioned here, higher levels of a HN system perceive (measure) lower levels, which prior to this perception (measurement) exist in a state of indeterminacy, and thus the upper level chooses, or at least probabilistically influences, the lower level into a preferred (by the organism), more negentropic, state. Once again I am not attempting to posit the mechanism of this perception/measurement except to speculate, as above, that lower HN systems may have a kind of proto-mind (or "mind") of their own, which has the effect of suspending "virtual" states in super-position. (I would also note in passing that according to the traditions of Idealism east and west, there *is* no mechanism, just as there is no "mechanism" for the charge or spin of a particle. This correlates with the view presented here that interiority is an inherent aspect of hierarchically negentropic systems, that hierarchical negentropy and interiority are basically the same thing as seen from different perspectives).

So when a high level hierarchically negentropic system intends an outcome from an indeterminate future, what it may be doing is perceiving/measuring one among perhaps trillions of outcomes super-positioned in an indeterminant quantum space. And by actively perceiving it, causing (or, more likely, probabilistically influencing) it to happen. (Thus the admonition to not focus on outcomes you don't want to come into your life, which, of course, has to be balanced against noticing that truck bearing down on you).

The Hypothesis

So, my hypothesis is as follows: Hierarchically negentropic systems are associated with partially non-local information/probability fields. These fields entail or express interiority and carry information, in the form of solutions, to other similar HN systems directly ("entangled learning"). In biotic forms of HN systems two additional factors come into play. First, this information is carried in particular to progeny, which process could be considered to constitute non-genetic (or "Sheldrakian") evolution. Second, the field effect of this information causes otherwise random mutation to become somewhat non-random, thus partially directing genetic evolution via quantum observation/measurement. Evolution in all domains is best understood from a dual "inside" (observation) and "outside" (measurement) perspective.

Regarding genetic evolution, Richard Dawkins has said,

> We can imagine (just) a form of mutation that was systematically biased in the direction of improving the animal's adaptedness to its life. But although we can imagine it, nobody has ever come close to suggesting any means by which this bias could come about. (Dawkins, 1986, p. 312)

My speculation is that the above information/probability field effect may be that means.

Kauffman and Thompson

Reviewers of earlier drafts of this essay suggested that I should contrast the views presented here with those of Stuart Kauffman and Evan Thompson. For the former I refer to his *Investigations* (2000) and *Reinventing the Sacred* (2008). For the latter I refer to his *Mind in Life* (2007). I am not attempting a comprehensive critique of these writings, nor I am claiming to have fully mastered the theory of either writer. Kauffman appears to believe that autonomy and interiority vanish below the level of autocatalytic sets, and Thompson similarly believes that they do so below the level of autopoiesis, whereas I am saying that "entangled learning" and presumptively interiority exist at least at the molecular level, if not lower. Autocatalytic sets are chemical reactions which are self-creating. So if we have four chemicals and they are related such that

A → B → C → D → A

then these are autocatalytic. Autopoiesis adds the conditions that the set is bounded in a membrane and that it reproduces itself as a set. So to self-creating, add self-reproducing. Both gentlemen believe that below either autocatalysis (Kauffman) or autopoiesis (Thompson) it's "all just physics," by which I mean that the principles embodied in the Abstract at the beginning of this essay do not obtain:

It is hypothesized that hierarchically negentropic systems (defined herein), including organisms, are associated with partially non-local information/probability fields which, a) entail or express interiority, b) engender "entangled learning" with similar negentropic systems, and c) cause otherwise random processes, including mutation in biotic systems, to become somewhat non-random.

I am saying the evidence seems to indicate that even molecules (and presumptively more basic constituents of matter) "learn" (Sheldrake), and that this "learning" appears to have the same non-local characteristic which is associated with conscious learning of, for instance, rats or people. In particular I am suggesting that the DNA molecule participates in this kind of "learning," and that it is amenable to being affected by the consciousness of organisms of which it is a constituent part. Furthermore, I am saying that hierarchically negentropic systems of all sorts, not just organisms, embody something akin to consciousness, namely "interiority," which is associated with this learning.

Both Kauffman and Thompson profess "emergent" views, which is to say that at some level, for instance autopoiesis, something emerges that was not present before. In a general sense this is obviously true. Cats clearly act differently than rocks. On the other hand, if rocks are totally mechanical, fully explainable in terms of physics, then where does this "something" come from? A very, very complex machine is, after all, still just a machine. Neither Kauffman nor Thompson answer this question. With others, I am saying that qualities we identify with living systems, interiority among others, exist, at some dilute degree, even in matter at its most basic level. In a sense I am saying, as against Kauffman and Thompson, that there is no such thing as totally "dead," "insensate" matter. Furthermore it appears to me that quantum processes are implicated in interiority (and vice versa). And as a concluding generalization I would say that, with others, my model embodies a vision of mind/interiority that is joined to hierarchically-organized matter at a much deeper level than envisioned by either Kauffman or Thompson

The Model

With tenets introduced and discussed, and my hypothesis given, it is time to present the model. Parts of the model presented below are based on evidence. Other parts are conjectural.

Organisms, advanced hierarchically negentropic systems, attempt to survive, to maintain their negentropy, both in themselves and through their progeny, as well as, to a lesser extent, through genetically related organisms (and perhaps through other organisms related in some other way, co-religionists for instance). They also feel a teleological pull towards greater negentropy, and towards greater interiority (the same thing seen from the "outside" and "inside"). These dynamics are at play both at the genetic level ("selfish genes" want to propagate themselves as portrayed in sociobiology), at the level of the organism, and at the level of the species (and perhaps higher). Every hierarchically negentropic system is attempting to maintain or increase its negentropy. Thus genes direct the organism, but the organism also directs the genes via partially "adaptive" mutation (Cairns). This is done via the creation of an information/probability (IP) (morphic) field by the organism. And genes as well as other hierarchically negentropic systems, such as organs, also create their own IP fields (and thus have their corresponding levels of interiority).

There is "something that it's like" to be in such a field. This feeling is the interiority, or proto-consciousness of the organism, projecting outward into the environment, and downward into its organs, cells, and genes (and further downward to atoms, etc.). When the field maintains itself, life is maintained. Same thing. When the teleological "pull" of the next higher field (i.e., from a higher level negentropic system, which may only exist as an "implicit" reality in super-positional quantum space) comes into play, this is the action of directed evolution. (For those familiar with his writings, this is an example of Dan Dennett's prohibited – by him – "sky hooks.") If the "feeling" of this higher field could be translated into human language (which it can't be, and which of course represents outrageous anthropocentrism), it might be something like, "I wish I could swim faster" or whatever ("thought" by millions of fish). In other words, it's not just an abstract thought (to the extent that the organism—or molecule for that matter—in question can formulate a thought), but a "thought" backed by desire, the desire to live, to strive against entropy, which is the most basic desire of any organism (or other hierarchically negentropic system). So organisms "push" against, and shape, their "genome space" in the same general manner that people can "push" against the probability field of a Random Number Generator, causing it to become slightly non-random.

If a gene is precipitated out of the quantum genome space, which is useful in helping the organism to survive better, then this "solution" (the gene) becomes more likely to be precipitated by other similar, or identical organisms elsewhere. There's "something in the air" concerning a solution, and these related organisms then become more likely to "chance upon" the same mutation. This mutation may pop up simultaneously, or near simultaneously, at various locations around the world. And the more it precipitates, the more likely it becomes to do so. (This is an extrapolation of Sheldrake's finding.) At the same time, normal neo-Darwinian processes are at work, and those organisms that acquire the lucky mutation from their parents likely will have more offspring. And on it goes.

As explained earlier, in McFadden's view quantum evolution, roughly the process described above (albeit without reference to the "inside" interior dimension of things) ends where Darwinian evolution begins, which he sees being with multi-cellular organisms. The view presented here is contrary to his in this respect since I speculate that macro-evolutionary jumps—for example, mammals take to water and breath through their backs—need the "juice" of quantum superposition. In this respect, the view expressed here is similar to Goswami's, who sees a swing between neo-Darwinian (micro) and quantum (macro) evolution when big jumps happen. However, what exactly the mechanism for this might be is unspecified here. If the view here, that quantum evolution continues after Darwinian evolution gets traction, is correct, then perhaps the "butterfly effect" (that tiny changes in one place can cause large effects elsewhere), may be a part of the mechanism. In other words, tiny (initially quantum) changes may be amplified upwards into macroscopic morphological changes. After all, even in the standard MES view, changes in a few genes can produce these large kinds of effects.

So, at certain times in evolutionary history greater challenges (or opportunities) will arise. In these cases it isn't just one gene that would allow a biological jump to be made, but perhaps a whole family of genes. These are the "irreducible complexities" of Intelligent Design proponents (although most of the examples these proponents cite, such as the development of the eye, probably have satisfactory gradualist, neo-Darwinian explanations). In this case a whole series of super-positioned genotypes have been propagating in quantum space (alternatively, in the multi-verse). When one of these "hooks up" to the phenotype (the organism) in such a way as to increase negentropy (and replicability), then this "quantum genotype" is precipitated out. In short order (geologically speaking) fish take to land, land animals to water, dinosaurs to the air, organisms learn to navigate great distances, they become warm blooded, produce live young and acquire the means to suckle them, acquire opposable thumbs, their brains grow explosively, and the list goes on. (If species on the top of negentropic "hills" are ever separated by entropic "valleys," then something like this must necessarily be involved since the MES requires each genetic change, if it is to be propagated, to be "higher" than the adjacent phenotypic space. It is unclear to me whether evolution presents such a "hilly" landscape.)

Moving down the evolutionary scale to the pre-biotic, the same kind of process happens when novel molecules learn to crystallize for the first time, only this time genes are obviously not involved. The molecule "wants" to crystallize, and it projects a probability field with this "desire" (outrageous anthropocentrism again). This projection pushes on the quantum version of the molecule, which is going through perhaps trillions of permutations all at once, all in quantum super-position, until, finally one, with a local energy minimum, precipitates out into classical space, and the molecule crystallizes.

This exploration in quantum space may be random, or non-random. As covered earlier under the double slit experiment, an aspect of quantum reality is that these processes can't be directly perceived since perception causes them be become non-quantum. Therefore, the question of random vs. non-random may be impossible to determine one way or the other. (This fact allows Brown University biologist Ken Miller [1999], devout Catholic and Intelligent Design debunker mentioned earlier in relation to the evolution of nylon-eating bacteria, to tuck God into quantum space, behind the "Planck Curtain," so to speak.) If it is random, then this exploration is more-or-less neo-Darwinian, only transposed from classical to a quantum reality. As Dawkins says, "mutation is not systematically biased in the direction of adaptive improvement" (1986, p. 308). So likewise here in a random exploration within quantum space (i.e., if the exploration is random). Besides the (hypothesized) fact that this process is happening in quantum vs. classical space, the other difference is that, while under the MES the sorting out is done via natural selection (which, of course, has no applicability to the pre-biotic world of molecules) here it is done via entanglement of a "virtual" (quantum) molecule and classical reality in which a precipitated version of that molecule conforms to an energy minimum. This is basically the same process McFadden covers in his description of how quantum versions of gene mutations become entangled with classical reality once the corresponding classical version becomes capable of replication.

Once this crystallization happens, other identical molecules “tune in” to this solution and begin to crystallize in the same way (Sheldrake). And the more it happens, the more it happens, until they all crystallize similarly. Thus the atomic properties of a molecule do not constitute all the information contained in (or perhaps around) it. A molecule that has “learned” to crystallize is different than an atomically identical molecule that has not. Where that information resides is a question for which I don’t provide a hypothesis other than to surmise that it presumably must be in some kind of partially non-local quantum space. Actually this is not-dissimilar to the standard notion (beloved most especially by mathematicians and theoretical physicists) that the laws of nature reside in a kind of “Platonic” realm, so that they were in place from the “git go” 14 billion years ago. (Sheldrake explores this in *The Presence of the Past*, in which he speculates that perhaps the laws of the universe could more accurately be termed “habits” of the universe. I don’t know. Of course, if they are habits, they must be formed according to some laws, so we can’t escape more or less Platonic law altogether.)

Moving to the other end of the evolutionary scale, to *homo sapiens*, the same process is also at work but, as with molecules crystallizing, again largely not genetically (although neo-Darwinism remains in place). People learn a skill, say taking intelligence tests. Of course, there are no appreciable genetic changes from one generation to the next, and yet people get better and better at taking these tests (Shermer, mentioned earlier). Are they getting smarter? Unlikely. More likely they are altering the energy fields permeating their heads so they can perform these tests better. When one person does it, that makes it easier for the next to do so. If a million people learn to do calculus, or to skateboard, or to operate a computer, or whatever, this makes it that much easier for the millionth and first person to accomplish the same task (Sheldrake). This may represent post-genetic evolution (although non-genetic evolution may be a better term since it is shared with, e.g., pre-biotic molecules).

The End

Likewise with *satori* experiences of “at oneness” with the universe. The more people have them, the more people have them. Of course these, like all experiences, come and go. But they also leave a residue. After such an experience things are not quite the same. The idea that we all share the same consciousness in our deepest interior ceases to be ridiculous and starts to seem like a perfectly reasonable concept. The idea that life after the death of the body is like another country vaguely sensed beyond the broad horizon of the earth seems at least plausible, if not really explicable. As does the concept that one could be a conduit for healing of another, drawing on the energies of the universe, the conscious universe, the conscious, loving universe. Infinite negentropy somewhere. In one’s deepest soul. It’s a thought that remains, sometimes in the form of a sketch for a New Model of Evolution.

Well, there it is. Like any sketch, this one is a little rough. After all it *is* a sketch, not a fully formed picture. But I intend to start work on the picture in due course, having bought a canvas and the oil paints, and having moved these into the drawing room. In the meantime, if any readers find egregious errors in fact or logic in what was presented here, I would appreciate having these pointed out to me since I want to paint the subject as accurately as I can, “warts and all.”

"I want to know God's thoughts; the rest are details." – Albert Einstein

“You can explain things for people, but you can’t understand for them.” – Felix Rohatyn

“Science progresses one death at a time.” – Niels Bohr

A Leadership Journey:
Personal Reflections from the School of Hard Knocks

R. Scott Pochron

Abstract: The following paper chronicles the evolution of the author's thinking on leadership through the course of his work experience. Leadership is viewed as a dynamical process involving both formal and informal roles. The process is initiated as an individual identifies opportunities and feels pulled to respond to emerging patterns and initiate action to enable positive change. The dynamics between formal and informal leadership structures and leadership as a state of mind are discussed.

Key words: Adversity, complexity, fundamental state of leadership, leadership, requisite organization, self transcending construction.

The following paper presents a reflection on my personal journey and evolving understanding of leadership based on my work experience over the past 17 years. As I look back on the time, I recognize that much of my current interest in leadership and complexity has evolved from crises that have I have confronted and attempted to overcome. This paper chronicles the development of my thinking on leadership.

Stages in the Journey

Through my career I have seen various touch points that have shaped and influenced my perspectives on leadership. Fundamentally I have experienced my role as a leader as one who articulates and puts into action a vision for a future that inspires others to join in … at least to a point. Frequently along the way it has been the disequilibrium of resistance to that vision that has been the greatest influence on reshaping my focus and thinking about leadership, as I've struggled to overcome obstacles. I have come to see leadership as a dynamical distributed process among actors.

There are some fundamental principles that have driven my beliefs about leadership as a process. In this regard, I believe I have adopted an informal methodology akin to grounded theory, as I take in information about an area of concern, formulate a theory about how to address it and then test and modify that theory through active engagement. Frequently I have found that additional learning (through books read on the subject of inquiry) have supplemented the theorizing process, and not inconsistent with grounded theory methodology where review of the literature often occurs after initial data and theorizing has started (McGhee et al. 2007).

There have been peak events through my career that have shaped my perspectives on leadership. However, the past eight years working for a large multinational company have served as the informal laboratory for the development of my thinking that has lead to my current graduate studies in Leadership Dynamics.

SOME RIGHTS RESERVED

I recall the bittersweet excitement of joining the company. I had been employed as CIO for a smaller publicly traded company that was subsequently acquired by the larger multinational company (about 60,000 employees globally). I had worked through the emotional transition as operations were shut down and transferred to new corporate headquarters. Of the 150 employees in the company, only about 10 of us were offered permanent positions and relocated.[1]

My new position in the acquiring company was, in my opinion, a dream job – devising a long-term strategy for the growth of a key business unit from a process and technology perspective. I quickly noted operational problems and developed recommendations to address them. However, my dream was quickly shattered as I soon realized that what I was hired to do and the willingness of the management team to embrace new ideas were not necessarily aligned. Over the past eight years, I have watched as the company has grown substantially – largely through acquisition – and yet somehow continued to suffer from the same challenges I noted when I first joined.

Organization as Organism

My first day at work with the new company, I was struck by the tyranny of meetings that absorbed so much time there was no time left to do work. Employees were frustrated because they did not have access to their managers for direction. Projects were not being completed in a timely manner because the subject matter experts needed on them were double or triple booked and unavailable. Organizational beliefs about collaboration required all key employees that were stakeholders to a project participate in discussion and decision making. Yet, decision making was an extremely slow process as there was no clarity (with the exception of a handful of senior executives) as to who had decision making authority. Very often a meeting would be called to make a decision. A group would gather and discuss the issue, but because one key person was not present (double booked in another meeting!) the decision could not be finalized. So another meeting would be called and on and on it went as a never ending caucus-race.

While I was brought into a company as a change agent and explicitly tasked to bring strategic change to the business unit to which I was assigned, I quickly realized that this was not truly the case. Interest in change was driven solely by the immediate short term demands of specific clients, executives or what did not significantly impact the status quo. At this time I managed a team responsible for coordinating technology related projects for the business unit; I also reported to the Executive Vice President of the business unit. At one point I had a lengthy conversation with him about problems in the way we were working with the larger IT department. That conversation ultimately resulted in a reorganization in which a new VP of IT was brought in, the team that reported to me was passed on to someone else, and I was to report to this new boss as an independent contributor.

This transition was an extremely difficult period for me, yet significant in shaping my views of leadership. First, I went through a season of deep self searching as I worked through the shift from manager to independent contributor. This was a period of deep reflection on my sense of identity, my values, and sense of personal integrity. I interpreted this transition as the system self-organizing and engaging a new way of addressing IT within the business unit (a significant process improvement), however the reorganization left me in a shadow role to what I was originally tasked to do. A new major acquisition had just been signed and the focus of the whole company had shifted from future strategy to short term integration. After about six months in this position, I moved out of the business unit to work in a new role within the larger parent company.

---

[1] I will speak more about what I learned from this difficult transition in a later section.

Leadership is largely about exerting influence in a manner that encourages others to follow to a desired outcome. Various authors have come up with definitions along the way. My favorite remains Sun Tzu in the *Art of War*: “The way [of leadership] means inducing the people to have the same aim as the leadership, so that they will share death and share life, without fear of danger” (Sun Tzu, 2005, p.43). For Sun Tzu, leadership was about strategy, relationships, and a dynamic that aligned a shared vision that might also call on those so aligned to take action that may transcend personal self interest; the definition also recognizes the collaborative dynamic that leader and follower share in participating in this vision – both share the benefits and risks in its pursuit.

Understanding this inner dynamic of shared vision was also consistent with other schools of thought that I had aligned with. Senge’s works (1990; 1994; 1999) on learning organization theory reinforced the need for personal mastery, defined as an openness to question one’s own perspectives – the mental models that frame one’s understanding of how the world works as a starting point for learning. Additionally, Senge’s work introduced me to systems thinking and understanding the integrated wholeness of organizations. This perspective was reinforced by my studies of Neurolinguistic Programming and Neuro-Semantics, which provided a rich model of understanding human communications and the way in which we construct our mental maps of the territory. A key learning for me was the principle that “the person with the most flexibility exercises the most influence on the system” (Bodenhamer and Hall 1999, p. 81). This principle reinforced the importance of self mastery, driving the point that the person who exercises the greatest mastery over their own behavior and attitudes is able to exercise the most influence with others. Quinn (2000) also supported this notion by emphasizing that transformational change occurs when we choose to change ourselves – often by choosing behavior that is self sacrificing in nature. I made the commitment to learn to be the difference I want to see in the world, and develop my personal flexibility within the corporate system.

I found this conscious decision to be freeing and challenging at the same time. Freeing in that I found myself liberated from a sense of self that derived value from titles, and power roles (I realized in my changing role, that I had part of my self-identity in the work context was tied to having employee relationships). This commitment was also challenging as I began to explore the process of leadership outside the mainstream hierarchical power structure that could mandate action through positional authority. As an independent contributor I found myself free to lead in a variety of ways, emphasizing the importance of influence in the contexts that I was called to serve in.

I also mentally stepped back from the situation and began to look at the business, its internal and external stakeholders, and the parent corporation as an interwoven system of relationships that in many ways behaved as a living organism. From time to time I would go out to a hill on the property that overlooked the corporate offices. I would envision the ebb and flow of people as they moved about their work, the processes of various departments that enabled this organism to be successful. I also realized that it was a lack of attentiveness to the signs of *dis*-ease in the organization that most often resulted in a flurry of activity when minor symptoms evolved into major problems. I recognized that an aspect of leadership is to discern this ebb and flow of the organization and identify the systemic pain points proactively – early enough so that adequate time is available to resolve the pain points *before* they become serious.

The challenge I noted was that pain measures the threshold for attention in light of competing demands. Very often key issues remain untouched solely because the situations have not reached the pain point necessary to capture adequate attention. Part of this appeared to be an issue of prioritization; part an issue of prevailing beliefs (operating as a perceptual filter) within the culture that influence what employees attend to. Busyness and firefighting were perceived as good customer service and rewarded, rather than finding ways to proactively reduce the impact to effectiveness and efficiency of employees and the customer experience through better process. In this I recognized that assessing *organizational readiness* – the ability to see and overcome limiting beliefs to engage in self-transcending construction2 – was a critical skill of leadership. The leader who can recognize the thresholds of organizational readiness is able to proactively choose when or when not to act for best advantage. It is not enough for a leader to take action; the leader must also discern when to take action so that the influence will have best effect.

Leadership as Enacting an Emerging Future

A core belief I have held about leadership is that the leader is one who sees a potential future and sets in motion actions that move those involved toward that vision. Over the years I have found that my time horizon (based on the work I was tasked to do) has provided a fairly accurate view of emerging future 3-5 years out, and I have felt a strong pull to take action as a means of preparation for meeting that future vision. Frequently that takes the form of recognizing the gaps between the resources required to operate in that future state and actions needed to close the gap. The leadership challenge comes in being able to express this vision when others may not have the capability to think that far out into the future or agree to what that future should be and what it will take to create it.

Graduate studies have expanded my understanding of this dynamic through the lens of adult development and Jaques's model of Requisite Organization (2004). Post formal adult development focuses on the capability of an individual to conceptually embrace complexity. There are many models for this type of development and for purposes of this paper I am limiting myself to Jaques's articulation of mental capacity. Jaques noted that mental capacity for complexity correlated with one's ability to complete work n-years into the future; the longer the duration of the task assigned the greater the complexity of the work and mental processing required to complete it. The leadership process then needs to account for contextualizing that future vision in time spans that have relevance to each person in the organization. This is not just

---

2 Self transcending construction is a term proposed by Goldstein (2008) as a preferred description for emergent phenomena within human organizations. Emergent behavior essentially provides an opportunity for a developmental shift in ways of thinking, being and acting within a specific context.

a senior executive speaking about corporate vision. According to Jaques, aligning individual contribution to shared vision is a leadership practice that each manager is accountable for. In this regard, shared vision is a distributed process that occurs at all levels of the organization, which then is able to align individual action with short and long-term goals.

Disequilibrium

Disequilibrium is an important state in the dynamics of an organization; it is the point at which the possibility for self transcending construction of novel approaches to specific challenges is most likely to occur. It is in the pressures associated with disequilibrium that the pain thresholds reach a critical point that opens an organization to be more receptive to emerging possibilities. Yet there is a difference in the role that leadership plays in such states. In a catastrophic situation (such as the transition period when business operations were shut down as previously described), the immediate role of leadership is to make sense of the situation and address the emotional unraveling in morale. I was one of the senior leaders called upon to speak to the employees immediately after the announcement that the company was to be closed. After months of talk of the positive benefits of the merger, one hundred and fifty people were essentially told that they were losing their jobs – a third of them, that very day! I invited everyone to come together into a tight circle, acknowledged that there had been a death in the family but now we knew where we all stood. I also was able to pass out a booklet to each employee on dealing with consequences of a merger. I had arranged for these booklets without knowledge of what the outcome of the merger would bring. In discussions with employees after that meeting, I received validation for the value of the discussion in bringing a shared sense of acceptance to the reality we faced; they also commented that the booklet brought a tangible sense of being cared for in the process.

There is a paradoxical dynamic to disequilibrium states. Frequently it is the acute sense of pain experienced during these states that invites an openness to change and new ways of seeing that enable self-transcending construction. A disequilibrium state can also have the converse effect resulting in a resistance to change. In my experience, the challenge of leadership is the ability to proactively anticipate and influence change *before* the disequilibrium state becomes acute. My own sense of ambiguity served as a motivator to purchase the “merger transition” booklets prior to the finalization of the merger (I had intuited that the outcome may not be as favorable as had originally been voiced by management). Since organizations operate as complex adaptive systems, the dynamics that lead to disequilibrium typically exist as symptoms which can be observed and responded to long before the problem becomes critical. In this regard, the process of (proactive) leadership has a self regulating effect in the organization by enabling the process of self-transcending construction.

Leadership as a Process

Through my experiences I continue to see leadership as an ongoing process that occurs in human organizations through the interplay of formal and informal relationships. Leadership as a process is embodied by actors who choose to respond to a situation. Formally, the leadership process is exercised through hierarchical structures of management. While the function of management is different from that of leadership, I ascribe to the principle espoused by Jaques that management is accountable for leadership practices to align their subordinates with the vision of the enterprise.3 Jaques's Management Accountability Hierarchy (MAH) is also structured to account for adult developmental factors – a manager is developmentally one stratum (as defined by ability to deal with work of a specific level of complexity) higher than their subordinates. Consequently, the manager should be able to bring more complex thinking to problems that a subordinate may face, and in so doing bring value to understanding the work. Likewise, the subordinate is accountable for sharing insights about the work with his/her manager who can pass on trends and insights further up the ladder. Jaques's model for administrative leadership through the formal hierarchy of management creates a bidirectional feedback loop that maintains good intelligence moving through the organization. This operates as the core nervous system and means by which work and decisions flow through the organization. Put succinctly, *effective* leadership is directly impacted by the organizational structure of the enterprise and the ability of the system to coordinate the developmental capabilities of employees into their work and communications flow. This has been a great awakening for me. Whatever skills I may have in enacting leadership may be compromised by ineffective structure in the system as a whole. In fact, I attribute the lack of a requisite organizational structure as one if not the major impediments to organizational ineffectiveness within my prior work environment.

Leadership as a State of Mind

Lastly, I have come to see leadership as a state of mind. This draws initially from the work of Robert Quinn (2004), which suggests that there are certain states that serve as attractors for the actor to take action that would be viewed as leadership in a given context. The Fundamental State of Leadership (FSL) creates the internal context that inspires the actor to respond and is reflected in four interrelated attitudes, which Quinn contrasts with opposing attitudes reflecting the "normal state." These are summarized in Table 1 below:

Table 1: Comparison of Normal State and Fundamental State of Leadership

Normal State	Fundamental State of Leadership (FSL)
Comfort-Centered: Desire to maintain equilibrium and consistency in life experience.	**Purpose-Centered**: Alignment with a purpose greater than self. Willingness to face challenges – to move outside one's comfort zone – in order to achieve the desired outcome.
Internally Closed: Self-preservation sets strong boundaries to external influences that would disrupt internal equilibrium	**Externally Open:** Takes on an attitude of curiosity and exploration in discovering what lies outside the comfort zone. Interprets experience as feedback to better align with purpose.
Self-Focused: Ego driven, puts self interest before the interests of others in a given context	**Other-Focused:** Willing to set aside personal needs for the sake of accomplishing the desired outcome and betterment of others before self
Externally Directed: Sensitive to the impressions of others; will conform behavior in order to ensure acceptance	**Internally Directed:** Personal accountability to be integrally aligned with purpose; self-confident and willing to act regardless of the opinions of others

---

3 Jaques defines 10 distinct leadership practices.

There are several implications to this model. First, that leadership has less to do with formal position and more to openness to the internal attractors that dispose the actor to perceive and respond to emerging phenomenon.[4]

The FSL serves two functions: first by creating an attractor that encourages active behavior that serves the greater good of the organization. Second it opens the actor to be more consciously aware of his/her perceptions and patterns of behavior. In this, the FSL represents a framework of attitudes that encourage post formal thinking – a more self-directed attitude.

I have seen this played out in my own experience. In the first three years of my tenure with my employer, I was very aware of the need for a Customer Relationship Management (CRM) system to better serve the organization and needs of its customers. My recommendation met substantial resistance with management as a prior attempt to put in a CRM system had been unsuccessful.[5] I was persistent in expressing this need – to the point that my manager told me that if I brought it up again I would be excluded from management meetings. And then the day came when he wanted a current client list and discovered that our current systems could not produce an accurate list. Suddenly putting in a new system became a priority… three years after the original recommendation. In a similar vein, as I transitioned to a role in the parent company, I conducted research, which led me to an awareness of the value of e-business and relevance for the ongoing growth of the company. I became a passionate advocate of e-business and presented numerous proposals to senior executives. My recommendations were not embraced, largely because senior executives did not believe that it was a viable tool within the industry. Ironically, 6 years later there is renewed interest in expanding e-business for the company.

These experiences reinforced for me a primary principle that the process of leadership is initiated as an actor (regardless of formal or informal authority) recognizes a particular need and chooses to take action, even in the face of obstacles. This reflects an alignment with the core attitudes described in the FSL.

I close with a case study where I consciously experienced the FSL in exercising leadership. I participated in a voluntary cross-functional team seeking to improve employee work experience. With gas prices on the rise, there was a strong interest in developing a strategy for telecommuting. Several solutions were suggested and were immediately shot down by the representative from IT as either being too costly, too time consuming for IT staff, or too risky from a company security perspective.[6] During the conversation I was struck by the possibility of using a specific technology that had not been discussed. In spite of obvious resistance from IT to offer a solution, I chose to do my own research7 and discovered that a technology that had been discussed seemed to offer a reasonable compromise on low cost, minimal IT support, and strong enterprise security. I went back to the committee with a proposal to pursue this option. I then went through a series of "gauntlets" to get the software approved for testing by IT, engaging in a pilot (which proved highly successful), and then working with IT and HR to define a process for rolling out the program.

---

[4] I do not dismiss the importance and significance of formal leadership structures; rather I am noting that leadership fundamentally operates as an internal response to attractors that enable self transcending construction as a response to a perceived reality. Within organizations, the interplay of actors taking action to lead in formal or informal capacities is dynamic and complex and beyond the scope of this discussion.

[5] Customer Relationship Management systems typically require a high level of coordination and voluntary participation of employees to be successful. Historically, a high failure rate has typically been associated to implementation of these systems in the industry.

[6] Note that this description is not intended to reflect negatively on the behavior of the IT representative. As an individual caught in the webs of larger meaning – coordination of the myriad of service requests from multiple functional departments with limited resources in staff and dollars can instill a mindset that

Several things struck me as I experienced myself going through this process. I felt "pulled" to conduct the research, and also made a *conscious* decision to prepare the proposal and push this through to completion, in spite of recognized resistance from some of the IT resources. This was not a project that was part of my normal work assignment, and I could have let go of the idea. Yet the inner states that focused on serving the greater good, and seeing the opportunity that this solution could provide served as an attractor to persevere through the resistance and ultimately lead to a successful result. Had I chosen to stay within my comfort zone, the new process and organizational dynamics would not have emerged.

I've touched on a number of aspects of the leadership process, which I have gleaned through my work experience. In summary, I have come to see leadership as a dynamic process that occurs in human organizations as actors perceive emerging possibilities and choose to take action. The willingness to do so is strongly connected to the actor's internal states, and engagement of the Fundamental State of Leadership. Finally, the effectiveness of the actor may be impacted by the actor's sphere of influence and by his/her formal or informal status and authority to act, and organizational readiness to embrace the change. I look forward to further develop these understandings as I continue my graduate studies.

favors self-preservation rather than innovation. Part of the leadership journey is recognizing the frame of reference from which others are operating, and learning to work with those frames.

[7] Note that choosing to do that research was not overstepping lines of authority. In my role at that time, I was heavily involved in developing strategies that involved technology solutions from the business side. I coordinated those projects with IT resources for implementation.

Creativity and Transdisciplinarity:
An Interview with Alfonso Montuori

Russ Volckmann

***Alfonso Montuori** is a member of the Editorial Board of Integral Review. He is Chair and Professor of the Transformative Studies Ph.D. and Transformative Leadership Master's programs at the California institute of Integral Studies. A graduate of the University of London, he is the author of several books and numerous articles on creativity and improvisation, complexity, and education. Alfonso consults with organizations and individuals on creativity and professional and personal development. He is also a saxophone player, producer, and voting member of the National Academy of Recording Arts and Sciences (Grammys).*

—Russ Volckmann

Russ: *Alfonso Montuori, it is a real pleasure to talk with you. I've had a chance to think a bit about your life and your work, and one of the very first things that struck me was the fact that you are Italian and you hardly ever lived in Italy. What was that about?*

Alfonso: My father was a diplomat for the Italian government. He married my mother when they were in Portugal, and my dad then was transferred to Holland. Coincidentally, my mother is Dutch. I was born in Holland, and lived in Lebanon, Greece, and England, before I came to the US. Despite the fact that I had an Italian passport, I never lived in Italy. I didn't live in the country that issued one of my passports until 2007, when I became a dual U.S. citizen.

Russ: *It's really quite extraordinary, the impact of that kind of lifestyle on individuals. I'm an Army brat myself, so I lived many different places. I found you lived in the U.K. for a time. I got the impression that you were involved in music while you were there—is that correct?*

Alfonso: Absolutely. I played saxophone professionally in a number of bands for five years or so.

Russ: *Would you describe yourself as more like Coltrane or Desmond?*

Alfonso: (laughs) Well, I loved both of them, and I was always very much influenced by jazz, but I didn't really play jazz. That was an interesting time in London in the mid- to late-70's when the stranglehold of the big record companies was broken. Young bands always had the Catch-22 of needing a record deal to get a gig and needing a gig to get a record deal. That all broke down around then with the punk revolution. That also coincided with everyone and their dog creating independent record labels and putting out their own music, which is what I ended up doing. After playing in a number of different bands, I created Banana Records when I put together my own band. Initially the band was more of

SOME RIGHTS RESERVED

a joke than anything else. It was really just an excuse for friends who were in different bands to get together and play wacky music we didn't think other people would like too much. But of course that happened to be the most successful band of the lot. We did a lot of really great gigs, we toured, recorded a radio show for the BBC, made some recordings that were well received, had a good agent and a good time. That was a nice stretch of time for me there.

Russ: How would you describe the style of music you were playing if it wasn't jazz?

Alfonso: That's an interesting question. When we started getting more successful and getting the attention of major record companies who wanted to sign us, they kept saying, "You obviously have a lot of fans, and we like the way you sound, and we like what you do, but we don't know what bin to put you in, in the record stores." This was in the day when there were still record stores and people would browse under different categories. They didn't know what to call us—rock, funk, jazz, comedy—we were a pretty crazy band. We crossed musical genres and that confused the hell out of them. We would do all kinds of stuff—we'd start every set by playing the theme from "Hawaii 5-0." From there, we'd go in any number of different directions and have a smattering of jazz, soul, bizarre tunes we'd write. We were like a psychedelic world-beat band—but not really!

Russ: So you'd start with one of the favorite tunes for surf bands and then move into the rest of the world. (laughter)

Alfonso: Exactly, and we had drums, bass, percussion, keyboard, guitar, trumpet, sax—we pulled it off.

Russ: Does this diversity of taste that you seem to have had in any way predict directions that you moved in when you left music?

Alfonso: Absolutely. For me, it's all autobiographical. All of the things that I'm looking at now in terms of creativity, transdisciplinarity and so on have their roots in my own experience. Things like people asking simple questions, such as, "Where are you from?" That always involved a story. I could never just say, "I'm from San Francisco." I'm not. It made me reflect on issues of identity. Sometimes I would just say, "I'm Italian," because I didn't have the energy to go into a spiel, or I'd brush it off by saying, "I'm from downtown Europe." But it felt more complex and anyway, saying I was Italian without actually having lived there felt somehow dishonest. So that definitely had an impact for me, because I believe that ultimately this complexity and diversity exists in every one of us, in different ways. It's just that for me the diverse cultural background made it more evident—it was a more glaring manifestation. It triggered a lot of my current interests. Categorization, disciplines, and narrow labeling inevitably mutilate the complexity of a human's life…

Russ: And constrain the creative potential that's there as well.

Alfonso: Exactly right! So I was also very interested in things like prejudice, racism and stereotyping, which all tied back to some of the work of people like Krishnamurti and the spiritual traditions that argued strongly against a tendency to label, categorize and think that we have these nice, ready-made understandings of what the world is really about. To me it was always far more complex and mysterious. No label or set of labels could do life justice. We live with this illusion that we know what's going on—maybe not cosmically, but at least in terms of everyday things, events, and interactions—but nothing could be further from the truth. I don't think we have a clue about anything. We just live with this delusion of familiarity.

Russ: I know you did your dissertation at Saybrook with Béla Bánáthy and others. How did you move from the world of jazz into working on a Ph.D. there?

Alfonso: I was in London in 1983 and I'd completed my B.A. at the University of London. Then the band broke up, as bands will; some friendships were broken. They've since been healed, but I was ready to get out. I didn't really feel any deep roots in England. England itself was going through a depression at that point, and there was a resurgence of nationalism. The Falklands War was going on at that time. There were right-wing racist movements like the British Movement and the National Front. I was always fascinated by California. The kind of people that I was interested in always seemed to come out of California, along with the music I was interested in, the writers that I liked, and so on. I decided to go check it out—surely the weather had to be better, and the food couldn't be any worse.

Russ: (laughter) And in that process you found Saybrook.

Alfonso: Yes. Initially I found the Monterey Institute of International Studies where I got my degree in International Relations. I had no idea what I was doing when I left London. I just went to an office on Baker Street in London and looked for a few universities that seemed to be in California. For some reason I thought I would do international relations—maybe because it was related to my experience living in different countries—I can't quite remember what my rationale was. I got a number of catalogs including one from San José State—I had no idea where San José was—and one from Berkeley that emphasized the difficulty in getting housing—and one from the Monterey Institute that had nice pictures of beaches and talked about the local seafood.

(laughter)

And I thought, "That sounds like the place for me!"

Russ: Well I don't blame you. It's part of the reason I live here.

Alfonso: Exactly! It was a beautifully soft landing. Monterey in 1983 was still a pretty boring and sleepy little town. So, in a sense it was perfect for me because there were no distractions. Actually, I thought there would be jazz—I didn't realize that jazz was only in Monterey three days out of the year for the Jazz Festival—so there wasn't any music worth talking about. I suddenly found that I had fallen in love with research and writing. The world of ideas had always been my other love. My father was a well-respected philosopher, as well as a diplomat. He wrote extensively on the Socratic problem, and my maternal grandfather, who was the CEO of a multi-national, had an amazing library with really interesting and diverse material—Jung, Fromm, all sorts of philosophy from Plato to Bergson to Heidegger, economics, Yeats, Joyce, Henri Miller, and much more. I spent hours browsing. I was always buying tons of books and records—and it just turned out that after all that music, I now enjoyed playing with ideas a lot. I got my M.A. and then went to China to teach for a year, because I realized I didn't know anything about China. I taught at the Central South University in Changsha in Hunan Provence, and that was a remarkable experience. I went back there for a conference on the work of Edgar Morin, and of course the changes from 1985 to 2005 were mind-boggling…

Russ: *Fascinating.*

Alfonso: I came back from China and looked for a Ph.D. program. Again, this is one of the things that was very motivating for me later on—I talked with a lot of different people about my interests. People in psychology said, "Well, you should be in sociology," Sociologists said, "Well, you should be in political science." Political science folks said, "You know, this sounds more like philosophy," and the philosophy people would say, "Try anthropology." The anthropologists would send me back to psychology.

(laughter)

It didn't make any sense! Really, I wanted to work with Frank Barron at UC Santa Cruz. Frank was one of the major creativity researchers, but he warned me that UCSC would frown of my disciplinary promiscuity, so I had to look elsewhere. Before I met Frank I had no idea that there even was such a thing as creativity research out there. I only came across Frank's work because I was interested in the CIA's experiments with LSD. I had written a paper on it in Monterey and I knew that Frank knew about this frankly shocking "research." Not that he was personally involved, but he was one of the people that played a considerable role in the psychedelic movement in the U.S., if only because he's the man who turned Tim Leary on. Frank was really serious about the potential and also about the dangers of psychedelics, and traced his roots back in the U.S. at Harvard, at least, to William James. He was actually thoughtful about the relationship of psychedelics to creativity and the evolution of consciousness.

Russ: *Did creativity play a role in your choice of dissertation?*

Alfonso: It was absolutely central. My interest in creativity did not come from my musical experiences, initially. I had read Adorno's, Levinson's, Frankel-Brunswik's and Sanford's *Authoritarian Personality* in Monterey because of my interest in racism and prejudice. Then I came across Frank Barron's work. He had done a lot of the key work at the Institute of Personality Assessment and Research at Berkeley on articulating the characteristics of the creative person. I put the creative person and the authoritarian person side-by-side and I saw that they were practically opposites. The authoritarian person would score high on intolerance of ambiguity; the creative person scored high on tolerance for ambiguity. The authoritarian person scored high on conformity; the creative person scored high on independence of judgment, and so on.

That was fascinating to me. I started to think about creativity not as something that's just confined to the arts and sciences, but as a way of being in the world. I started looking at educating for creativity as a way of educating for life in a complex, pluralistic, uncertain world. It seemed to me that creativity gave people the ability to respond to unforeseen situations, different situations and different kinds of people in a more creative and constructive kind of way. An authoritarian person would want to control or eliminate differences and surprises.

My experience with music and specifically with improvisation was very useful there, because it seemed to me the ability to improvise—to deal with the unforeseen, the unexpected, and in fact to generate it—was becoming essential for what the sociologist Zygmunt Bauman calls "Liquid Life." In the industrial, mechanical worldview of modernity we were educating for a "solid," predictable, homogeneous factory life where everybody's part in life, in the social order, was pretty much established. Improvising there meant having to make something up because the "one right way" couldn't be followed for whatever reason—it was essentially a response to a mistake, and, second best, born of necessity. But in jazz, improvisation was at the heart of the process, a central value, rather than a remedial move. And that's also why jazz has been called "the sound of surprise." So this is one way of articulating a tremendous shift in worldviews that reflects the centrality of creativity, and specifically an embodied creativity, in the moment.

Russ: *Interesting. Out of the U.K. comes the work of Sir Ken Robinson who I've interviewed for Integral Leadership Review. His work is on trying to promote more attention to fostering creativity in elementary and secondary education.*

Alfonso: Exactly. I think that's vital work. He's promoting a more complex and nuanced understanding of education and creativity. When I tell people I'm interested in creativity, I always want to hear what they think about creativity. How do they understand it? What does it mean to them? I'm interested in the implicit understandings of creativity. I think right now, we're going through sort of a transitional phase where there's a certain kind of creativity—an understanding of creativity that emerged in modernity—that is beginning to fade. It has to do with the lone genius—the "who" of creativity. It has to do with creativity being limited to the domains of the arts and sciences—the "where" of creativity. It has to do with the creative process portrayed as limited to the moment of insight, the moment the light bulb goes off—the "how" of creativity. There's a shift happening in our understanding of creativity that's quite significant, and I can even see it generationally. When you ask baby boomers about creativity and millennials about creativity, you get different responses.

Russ: *I would assume that what we are doing is going from the place of the individual creative act—the individual as a creator or having creative capabilities, and the* *collective as a source of a creative phenomenon while recognizing that creativity very often is emerging from the dynamics of relationships, interactions and life conditions and a variety of variables—into a position of a both/and. There are the dynamics of creativity at the individual level as well as the collective dynamics of creativity. Is that the kind of thing you're getting at?*

Alfonso: Exactly! There's an emerging networked relational understanding of creativity, with more emphasis on everyday/everywhere creativity, and with popular books such as Gladwell's *Outliers*, an increasing awareness that yes, creativity also requires hard work, practice, etc., which counteracts the romantic myth of genius without learning.

When I started looking at the creativity research in the 80's, my experience of creativity had very much been playing in a band. But there was no research on creative groups in the literature, and there is not nearly as much as on the creative individual. I thought that was really interesting, because that also reflects what we think creativity is, where it can happen, and how our ways of thinking influence how we approach a phenomenon—think reductionism and individualism, in this case.

Until very recently, when people talked about creativity, they talked about it in terms of the creative person, process and product, PPP. In this frame, the "who" of creativity always has to be an individual. It can't be a group or a relational process. So inevitably, the "who" or the unit of analysis—the actor—is always an individual.

That's beginning to change. We're also starting to look at the individual as not being a closed system that's isolated from the world. We're looking at the fact that creators work in *domains* that have a history. Coltrane and Charlie Parker were both great innovators, but they were part of jazz. They were part of an existing discourse that they had already internalized. This inquiry also starts challenging what our understanding of the individual is. The discourse refers to individual and social dimensions, but we can't forget that the individual is also social. We are in society and society is in us.

Russ: It would seem to me too that one of the things that would be useful in terms of thinking about creativity would be that of perspective. From a first-person perspective, something that may be creative for the individual in terms of his or her own life experience might be different from that which would emerge from a second-person relationship. That might be different from the point of view of an "objective observer."

Alfonso: It's the classic case of someone who comes up with a very interesting and creative solution to a problem, but that doesn't mean it hasn't been done before. Now the fact that that person comes up with an interesting, original solution is a sign of creativity. It feels creative and it is creative from that person's first-person experience and in that context. You frequently have this with children. Children are constantly creatively reinventing the equivalent of the wheel. From their perspective, it's a creative process and a creative product.

A different example: My wife and I like to travel, for business and pleasure. Occasionally she'll go into a hotel and say, "Well, it's clear that whoever designed this hotel has never actually stayed in a room they designed." And I think that's a brilliant insight. Academically, there's great research on this in Flores' and Winograd's book, *Understanding Computers and Cognition,* and the whole issue of first person perspectives. Very often, though, that's completely left out, and there's stuff that looks great on paper. Even when you see a drawing of it and you think it's fantastic and chic and elegant…the bottom line is, there's no place to put stuff in the bathroom, you know? What do you do with your stuff? This may look great, but there's no functionality.

Russ: Before we leave the stage of your dissertation, your Dissertation Committee Chair was Béla Bánáthy. What was his role in your thinking around this theory?

Alfonso: I was really lucky, because Béla Bánáthy was a wonderful teacher. Béla had deep roots in the systems world and had been President of the ISSS—the International Society for the Systems Sciences—so I was really happy and privileged to work with someone who had that kind of in-depth experience of the field and the community. Béla was very idealistic and very optimistic about the ability of systems approaches to be able to make a difference in the design of educational systems. He really stressed the "thinking" in systems thinking, and emphasized the radical nature of the shift implied by taking systems theory and cybernetics seriously. I also read and then met Heinz Von Foerster, Paul Watzlawick, the Italian epistemologists Mauro Ceruti and Gianluca Bocchi, and finally Edgar Morin, who developed the notion of complex thought.

Russ: So this whole piece about how we think—as you say—it has been an important piece. Can you say a bit about what that is?

Alfonso: Growing up in different cultures and always enjoying being exposed to different perspectives—when I was in London, I was a university student, I was playing in a band and working as an interpreter for the police in Scotland Yard. My parents were diplomats, so I moved around in a number of circles … And today, I have multiple lives: in academia, in the consulting world, and in music—I perform with and produce my wife, Kitty Margolis's work: she's a very well respected jazz singer (http://www.kittymargolis.com/), and working on her CDs, with such incredible musicians as Joe Henderson, Roy Hargrove, and others, has been an invaluable experience for me, not to mention a lot of fun.

From an early age, I realized that individuals and cultures construct worlds differently. That sort of became a continuing theme for me. Then in grad school, I read Thomas Kuhn's work and immersed myself in the philosophy of social science. I became very interested in the underlying assumptions of Western academic inquiry and Western thought in general. That's when I became interested in epistemology, in how we think about particular issues, the different frames we create, and how they both obscure and reveal. My personal frame was that it was all a creative process. I also realized that thinking has a certain logic, a certain architecture, if you will.

To give you an example, I think many misunderstandings arise about creativity because it is a paradoxical phenomenon. Creative individuals are said to be both more playful and more grounded in "reality," both rebellious and conservative, both "crazier" and "saner," and so on. But this requires a different way of thinking, a way of thinking that goes beyond our common logic of either/or. Because otherwise it's just, "see, creative people are crazy," and we focus on one dimension without taking into account the other. But if they're both crazier *and* saner, what does that mean? What are the implications for our definition of psychological health? What does that look like? There's also a shift to an ongoing process rather than a "thing," a broader spectrum of psychological and experiential possibilities, a different view of identity, and so on.

Russ: *When I think about systems theory, one of the critiques of pure systems theory is that it does not attend to those kinds of variables (what cannot be measured directly). Even in the case of transdisciplinarity, that whole piece about what we cannot directly observe has not played a central role—at least in Nicolescu's work, other than the notion of the included middle. But it does have a potential in the sense that in transdisciplinarity we're talking about levels of reality and complexity and the logic of the included middle.*

Actually, in an earlier issue of Integral Review, *I have an interview with Nicolescu about this. We'll have an article by a philosopher from Holy Cross, Predrag Cicovaci appearing in the October 2009* Integral Leadership Review *entitled, "Transdisciplinarity as an Interactive Method: A Critical Reflection on the Three Pillars of Transdisciplinarity." The criticism that he brings is that there has not been adequate attention to a fourth pillar that he would add which is values.*

In light of that kind of work, how has transdisciplinarity become a significant approach perspective/methodology in your work?

Alfonso: I have interpreted transdisciplinarity drawing on my own experience. So for me, I have four dimensions of transdisciplinarity. For me, it's inquiry-based rather than discipline-based. As an example, if I get called in by an organization that wants to be more creative, if I approach the job exclusively with the disciplinary perspective of the psychology of creativity, then what I'll do is to focus on individuals and give them a "creativity tool kit" so they can explore lateral thinking and other things in order to be more creative *individually*. Here you have an example of how a disciplinary lens directs you to certain kinds of approaches. An approach that's inquiry-based starts with the phenomenon in question, in this case looking at the organization and there many, many different things going on. That includes individuals, relationships, organizational culture, organizational structure, openness to risk-taking, the business climate, and all these issues that are typically addressed in different disciplines. For me, the important thing isn't the discipline, but the issue that I'm addressing. Then you bring in *pertinent knowledge* from whatever disciplines are relevant.

The second dimension of transdisciplinarity is something I call the "meta-paradigmatic." In other words, the question then arises that you're going to be drawing from all these different disciplines. Do you have to know everything about everything?

It's a typical question that's asked of people who want to do interdisciplinary work. The answer, I think, is no. If you're going to be drawing on other disciplines, you have to have an understanding of the historical emergence of that discipline, and you also have to have an understanding of the underlying paradigmatic assumptions. For instance, in the case of creativity, a sociologist and anthropologist have historically looked at creativity as a social phenomenon. They tend to be methodological holists, so for them, the individual is not important. For them, the individual is epiphenomenal in the same way that for psychologists, who are, by and large, methodological individualists, society is epiphenomenal.

If you look at most of the studies of famous creative persons, there's not too much interest in the historical context. The focus is usually personality and cognitive processes. For sociologists, it's the other way around. It's like, "Hey, look, if it hadn't been Darwin it would have been Alfred Russell Wallace. If it hadn't been Freud, it would have been someone else." In their view, society had collectively reached a point where certain questions and certain issues were ready to pop. Someone would have figured this stuff out sooner or later. So these are very, very different fundamental assumptions, very different units of analysis. Here we get into the philosophy of social science. It's how you create your understanding of creativity.

To make a long story short, no, you don't have to know everything about everything, but you have to know how different kinds of knowledge are constructed. How is knowledge created and constructed?

The third dimension of transdisciplinarity is that you have to have a thinking that allows for complexity, so it connects that contextualized information. It can't be reductive and disjunctive. It's not either/or. It has to connect and contextualize, because otherwise none of this makes sense. There's a common criticism that's legitimate of many forms of systems theory, namely that it is a form of mapping. The kind of systems-influenced work I'm interested in is quite different, and is fundamentally epistemological in nature.

When you look at the organization of both universities and the organization of thinking, there are interesting architectural parallels. When you look at the university, you have these different departments usually housed in different buildings. Disciplines have all these different branches. Knowledge is reduced to finer and finer levels of granularity. That's a reflection of the way we were traditionally taught to think—by reducing and isolating and getting down to the smallest variable—the logic of either/or until you reach the bottom. The university is the concretization and institutionalization of a certain way of thinking. So for transdisciplinary work, you have to learn how to contextualize and connect. That's originally what systems theory was attempting to do. The original mission of Von Bertalanffy was to create that kind of transdisciplinary language.

Russ: It seems to me that one of the drivers of Nicolescu's work is also the connection between theory and research; seeking to understand and practice. It sounds like that's something you share with him.

Alfonso: Absolutely. Transdisciplinarity is not at all some abstract, purely theoretical endeavor for me. It emerges out of a real need to address the complexity of life. And for me, the fourth dimension is that you have to integrate the observer into the observed, the researcher into the research—the person actually dealing with this complexity and trying to make sense of it. You have to address the researcher and his/her perspective and values and where s/he is coming from. You can't just bracket that or ignore that. For me, that's an essential part of transdisciplinarity.

In both of the programs that I designed at CIIS, we start out by asking people about their passions. When they tell us, that in itself becomes an opportunity for inquiry. You ask, why they are passionate about one topic but not another. This gives an opportunity for self-reflection, self-inquiry and finding out why one cares about something specific—and in fairness, why you would want to spend 4-6 years and a lot money working on it. As a result, a number of different issues emerge from their own life stories. So passion in this sense is good. We want passion—intrinsic motivation is central to creativity. At the same time we don't want people to be blinded by their passion, so once again you have an opportunity for self-inquiry.

Russ: From the point of view of the inquiry and the relationship to the transdisciplinarity perspective, doesn't this also speak to the value of recognizing the collective dynamics of that inquiry? For instance, when you go into a system as a consultant, you're engaging those people in that system in the inquiry. So the exploration or the design of the approach to generating creativity within the organization is going to be something that emerges out of that collective inquiry.

Alfonso: Absolutely—I couldn't agree more! When I talk to people about creativity in organizations, especially in a consulting context, they often expect me to come in with a specific process already in place, because that's what they're used to. I tell them each time that there is no cookie-cutter approach I embrace. I think it has to start with a collaborative research process in which we figure out what the best way is to facilitate the development of creativity in any particular context. That's definitely part of the process.

Russ: So transdisciplinarity and your interest in the metaparadigmatic also lead us into meta-theory. A couple of examples that have gained attention in recent years include Wilber's work in integral theory, and Ervin László's work in his theory of everything in the Akashic Field. How would you characterize, from your point of view, the transdisciplinarity overlay, the perspectives being offered by those two leading thinkers?

Alfonso: They each open a range of possibilities in different ways. Wilber does something I have always found very important, and that's expanding our understanding of human nature and of human possibilities. Underlying political, psychological, sociological, and essentially all theories in the social sciences is an understanding of human nature. These were still addressed explicitly by philosophers—from Plato to Hegel. But as the various disciplines spun off philosophy, the fundamental philosophical assumptions—such as the nature of human nature—were generally not addressed anymore. Specialization led to these key questions remaining un-addressed, which is why political theory has mostly barely addressed Freud, let alone Maslow. Another thing Wilber does very well is showing how much is typically left out of any particular inquiries and the extent to which they come out of a particular frame.

Russ: *He points at our blind spots.*

Alfonso: Exactly. What's also so interesting about Wilber and László is they are really pushing out into areas beyond what is considered safe within traditional academic boundaries and context. They are independent researchers who don't necessarily have to play within those kinds of safety margins in order to be assured of tenure or respectability or whatever. They can do that. In the programs I designed at CIIS we want to capture that excitement and creativity, and create a new context for academic research.

Russ: *You've had a relationship over the years with Ervin László, and as I recall, you edited an edition of* World Futures*.*

Alfonso: I'm the associate editor of *World Futures*. I've known Ervin for about 20 years, he's a truly remarkable individual. *World Futures* is the journal of the General Evolution Research Group, an interesting group of researchers that included Bela, Riane Eisler and David Loye, Karl Pribram, Allan Combs, Ilya Prigogine and Ralph Abraham among others. I think Ervin was interested in having these multidisciplinary dialogues and finding ways in which researchers in different disciplines could draw on these evolutionary and systems concepts. A lot of important work has been done, and these ideas are now becoming more widespread.

Russ: *In the field of leadership studies, there was an attempt under the auspices of James MacGregor Burns to use a multidisciplinary process to create a general theory of leadership. They published a book titled The Quest for a General Theory of Leadership under the editorship of Goethals and Sorenson. What is most striking about the results of their work that took place over several years was the fact that they did not, in fact, achieve a general theory of leadership. One of the things that I argued with Sorenson about was that one of the key reasons they did not succeed, at least from my perspective, was because they started from the point of view of multi-disciplines, and not with a meta-theoretical perspective. I'm wondering if you have any reflections on the importance of meta-theory and the practice efforts that we are concerned with.*

Alfonso: It's all too common to get people from different disciplines together and have dialogues that really don't go anywhere. Ultimately, there is little understanding of each other's fundamental, underlying assumptions. So the participants are really coming at issues from different theoretical perspectives, and are literally not speaking the same language.

I think a meta-theoretical perspective is really important. That's one of the reasons why I think a kind of thinking that is more open to connection, contextualizing, and draws upon systems and related theories, but isn't confined to them, is very important. It addresses some of the key fundamental issues and provides a language that can go across disciplines. Without that—without understanding each other's assumptions; without a shared meta-language—it's really difficult. Otherwise, you're just comparing positions rather than understanding them and communicating about them.

Russ: *What is the contribution of László's "theory of everything" to our efforts at finding a framework or perspective that helps us embrace the whole?*

Alfonso: One of the things that he did, particularly in the early days when he was still widely identified as a systems philosopher was to articulate some of these basic concepts in books like *Evolution* and the early systems books. I think many of those concepts can be used effectively to provide that kind of language and some basic concepts that cross any number of different disciplines. Just the concept of system, and the distinction between open and closed systems is very valuable, and in need of much more study. But not just in the context of ideas and how we use them. I think essentialism in all its forms is explicitly marked by a form of closed system thinking, for instance. Once you start looking at it that way, a number of interesting implications emerge. Over the last 10-15 years or so, I've found that Edgar Morin's work has been very useful to me. His work is not so much in the tradition of the Santa Fe Institute, but more on the epistemology of complexity. That's what really makes a difference. What is particularly interesting about Morin is that his work, which has already made a profound impact in the social sciences is now being recognized by biologists as leading the way beyond the reductive perspective of molecular biology. That's quite a feat, when you consider the contempt much of (post-)modern philosophy and social science is held in by "hard" scientists.

More broadly, what we need is a kind of education that prepares us for complexity, interdependence and uncertainty. But traditionally we have been taught that simplicity, isolation of variables and certainty are the *summum bonum* of inquiry. Our thinking has reflected that bias. In order for transdisciplinarity to thrive, we have to cultivate a new way of thinking, and, to be clear, a thinking that is not isolated from feelings, intuitions, and experience.

Russ: *Despite the resistance of academia to some of these things, there are glimmers of hope around the world in Brazil and South Africa and Europe where educational institutions are trying to take on transdisciplinary perspectives in their approach. I've just recently learned that Arizona State University has taken that on in a number of programs. I'm trying to find out more about that, and I'm going to Tempe for about six weeks later this month. Any hints as to someone I can talk with?*

Alfonso: No, I am actually more familiar with what has been happening outside the US. I've just recently found out about ASU. I've been meaning to look into it. I was down at the University of Vera Cruz in Mexico not long ago. They have a really innovative master's degree in transdisciplinarity and sustainability. They are very influenced by Morin's work. The head of that program, Enrique Vargas, was about to head out to ASU to study their work.

As you said, in Brazil, there is a great deal is going on in this area, and I was just in Peru where I was invited to be on the board of the Edgar Morin Center for the Study of Epistemology of Complexity at Ricardo Palma University in Lima. In Italy, at the University of Bergamo, there is a transdisciplinary doctorate, and there is some truly remarkable work going on out there. I'm thinking particularly of the work of Mauro Ceruti, Gianluca Bocchi, Sergio Manghi. At the University of Messina in Sicily, they are doing inspiring work on the philosophy of science and in education. In South Africa, John Van Breda and his colleagues are also doing some wonderful things looking at sustainability from a transdisciplinary perspective. So there is definitely a movement in the right direction.

Bruce Wilshire wrote a fascinating book about the perils of disciplinarity 20 years ago, *The Moral Collapse of the University*. He discussed disciplinary boundaries, and used Mary Douglas' work on purity and pollution to illustrate the way that new faculty members were purified of any polluting influences of other disciplines, precisely because there are a lot of issues having to do with territory, identity, where you belong, where funds come from, and also with the fact that if people are starting to play around with all these different concepts from different disciplines in one particular paper, then my education has to change. I can't just be a psychologist. I have to start spreading out, and the implications are huge. It's not just the students who are facing these challenges—it's the faculty, perhaps above all! So we still have a struggle ahead of us.

Russ: *I'd say this is just the beginning.*

Alfonso: There are signs that we will, by necessity, be heading in this direction. I think one of the important things to illustrate is this is not some abstract, theoretical effort. This is really an attempt to deal with the world and to do so with extremely practical implications. It's perhaps not surprising that transdisciplinarity is now associated so often with ecology and sustainability: one discipline just can't do the trick.

Russ: *Can you speak a bit to creative inquiry? We touched on that earlier.*

Alfonso: Creative inquiry is essential to both the doctoral and the master's programs that I designed at CIIS. If you look at the definition of a Ph.D. dissertation, it's defined as an *original* contribution to your field. But the bottom line is, no one ever talks to you about what "original" is, unless they're talking about plagiarism. I thought, "Well, what if we took this definition of a dissertation seriously?" Then, by definition, if it has to be an original contribution, then the dissertation has to be a creative product, and, the educational experience has to be a creative process. How about that as a starting point?

What I'm interested in is an educational process that is a creative process, whereby the process of inquiry itself is creative—where we are also engaged in a process of self-creation as scholars, as participants in this remarkable time, and ultimately as human beings. Any kind of university or educational experience has a tendency to change people, even a little bit. But what if we made that explicit? If a person is going to spend five years or so working on a dissertation, let's look at that as an opportunity for you to engage in self-inquiry and self-creation, as well as the creation of an "original contribution to the field."
